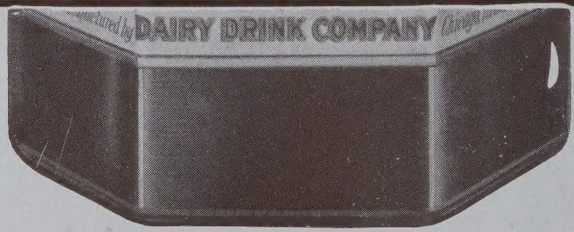
NO BENZOATE - NO CHEMICAL PRESERVATIVE
CHOCOLATED
Dairy Drink
12 FL. OZ.
PRICE 35¢
FOUNTAIN BRAND
SYRUP

Actual size of handy glass container, sealed tight and ready to pour. Retails at 35c, a most generous value. Adds the final touch to a dainty dessert — housekeepers should keep a jar handy at all times. Its mellow richness makes incomparable frostings, sundaes, chocolate milk, malted milks and other delicacies.

Dairymen can handle this product *with profit!*



There's a market for this tasty, luscious syrup in convenient package form as well as in the chocolate milk drink you deliver.

Dairymen the country over are finding that Chocolated Dairy Drink Syrup brings additional business. It makes customers of those who don't drink milk, and those who do, because of the many delightful recipes based on it.

Have you seen the "milk-cap" booklet? It's a real business builder. Send for free copy with sample of syrup.

The "ARISTOCRAT" of BOTTLE CLEANERS

Let us explain the mechanical details to you and how this Aristocrat of Bottle Cleaners is saving money for the most prominent of milk plants.

Where Tasks are Large and Economy Paramount

In milk plants where highly centralized distribution requires the largest kind of bottle washing arrangements, The Barry-Wehmiller Bottle Washer is on the job.

Its selection is not only due to its ability to wash more bottles and wash them better and more thoroughly within a given time and space, but it also does this for less money.

11 ADVANTAGES of DRINKING MILK IN FACTORIES

By M. O. MAUGHAN

1. Helps the employees do their work with *greater ease.*

2. Helps the employees do a *greater amount* of work each day, thereby *increasing their earning power.*

3. Helps them work *more regularly,* resulting in larger pay checks throughout the year.

4. Helps the employees do their work with *greater accuracy and efficiency.*

5. *Helps build up those who are undernourished,* and who should take added nourishment in order to continue their work.

6. *Reduces doctor bills* because of improved health.

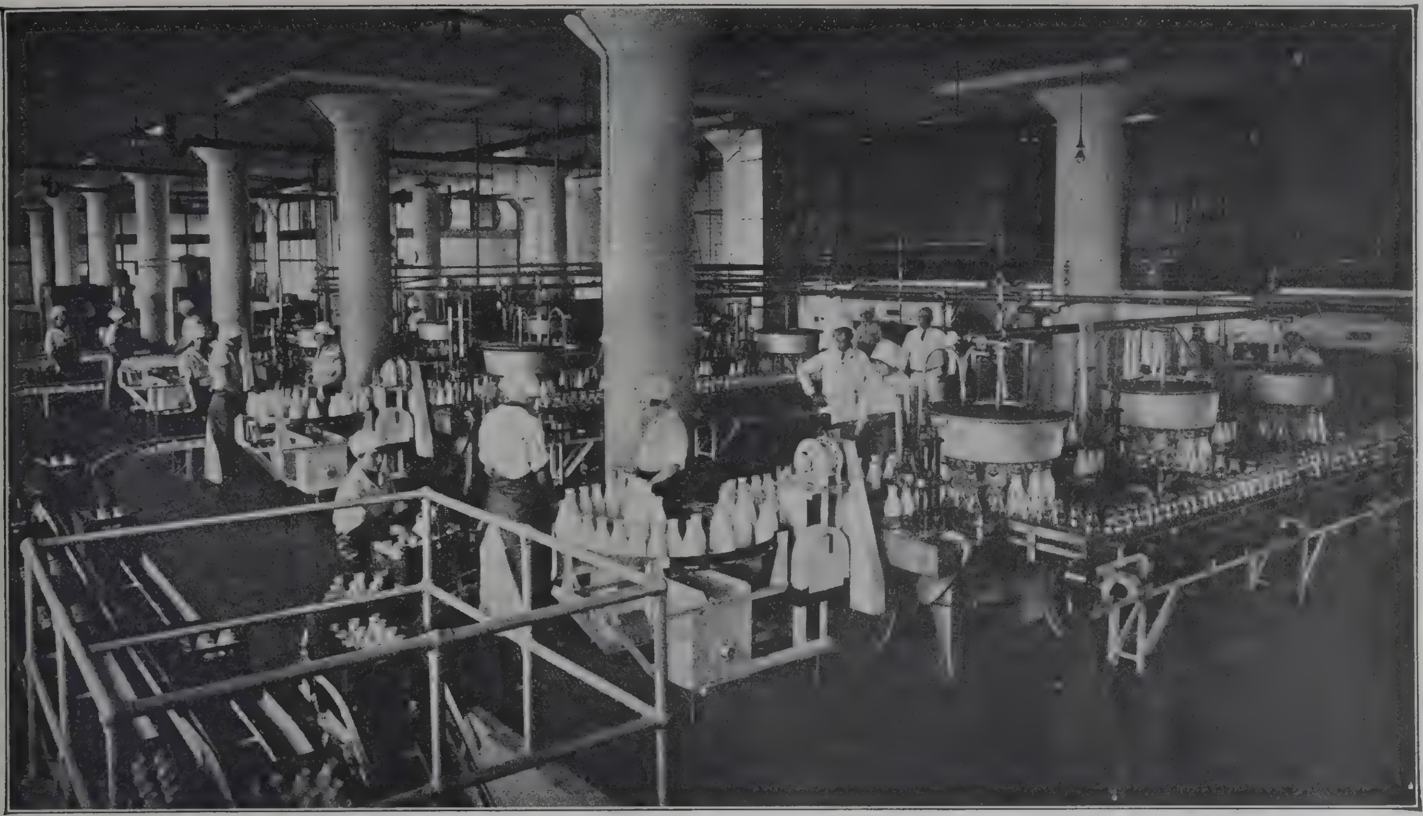
7. *Helps build factory morale,* thereby developing a better attitude toward their work, with less desire to watch the clock and to slow up and neglect their work when fatigued in mid-morning and mid-afternoon.

8. Serves as a *partial protection against poisoning* to those whose work involves handling paints, chemicals, etc.

9. *Reduces number of accidents* because milk steadies the nerves.

10. Results in the men feeling better at the end of the day's work so that they can *better enjoy their evenings* in recreation and with their families.

11. *Results in an increased consumption of milk in the home,* because the message of the goodness of milk is carried home from the factory.



A Wonderful Achievement in Milk Plant Engineering

HERE was a problem that required real engineering skill. The soaking and washing of the bottles is done in the basement—two floors below the bottling room.

Clean bottles at the rate of 480 per minute are delivered and distributed to the fillers in this room.

Three Large YUNDT MILWAUKEE AIR BRUSH MILK BOTTLE WASHERS

automatically feed these nine type L Milwaukee Fillers. All operations are synchronized to harmonious operation of the various units. Everything is controlled automatically.

What Yundt engineers and Yundt Milwaukee Air Brush Milk Bottle Washers have done for the Pevely Dairy Co. in this plant at St. Louis, Missouri, they can do for you. The size of your problem is no obstacle. A small problem receives equal consideration.

It's the Air Brush

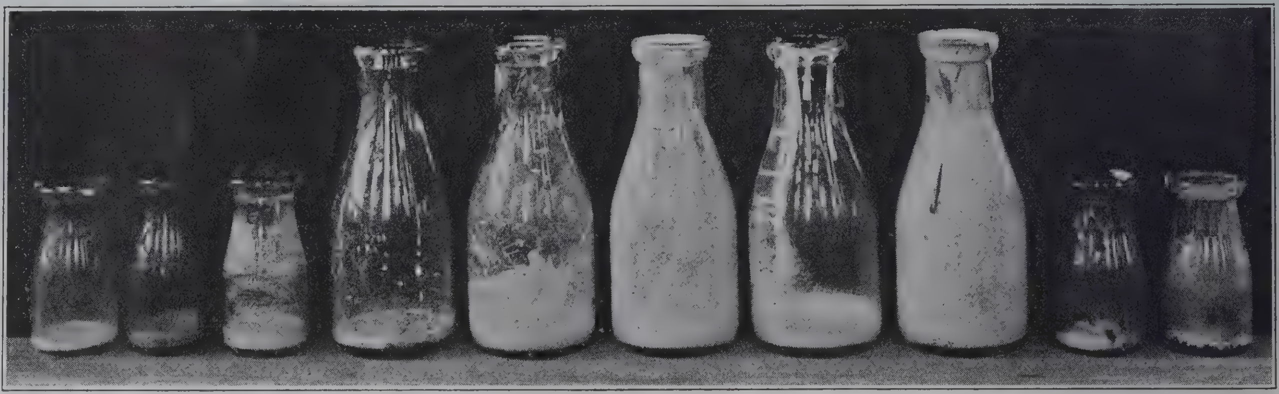
MILWAUKEE, WISCONSIN U. S. A. WAUKESHA, WISCONSIN

? - ? - ? - ? - ?

Here is a photo of several milk bottles as they came back to the dairy. Thousands of bottles like these, containing sour milk, butterfats, dirts, etc., which will not drain out by gravity, are returned to every dairy daily. A record made for one day's run in a plant where approximately 15,000 bottles are washed per day showed that over 256 pounds of this dirt, refuse, etc., still remained in the bottles when they were fed into the washing machine. Tests also showed that these substances could not be flushed from the bottles by merely giving them a light rinsing with hydrant water.



Do you think that these contaminating and objectionable deposits should be carried into the soaking tanks of the bottle washer and allowed to accumulate for weeks?

Under such conditions can an alkali solution continue to be a clean and sanitary washing medium?

Can such a solution maintain a uniform degree of alkali strength without continually adding large quantities of alkali to it?

Can a bottle containing a quantity of this dirt, butterfat, etc., receive the same chemical treatment from the alkali solution as one that enters the solution free from these deposits?

We dare say that the unanimous answer to these questions is NO. Then why use bottle washers which operate under these very conditions?

The CLEVELAND BOTTLE WASHERS are the only machines that remove all deposits from the bottles before they enter the soaking compartments.

The CLEVELAND METHOD of treating bottles not only means sanitary and efficient washing and sterilizing but also means a great savings in alkali, which amounts to hundreds of dollars per year.

The CLEVELAND BOTTLE WASHER insures you of the most modern, efficient, and economical method of washing and sterilizing bottles.

Built in all sizes and to meet every condition. Write for full particulars.

THE UNION ENGINEERING CO.

Cuyahoga and W. 4th Street CLEVELAND, OHIO

THE FASTEST WAY TO COVER A MILK ROUTE

No milk tray handled more than once!

This latest model Ward Electric has been designed especially to fill the needs of retail house-to-house milk delivery. It not only saves time over the "horse that knows the route," but will deliver the milk at less cost.

Loaded to full capacity the truck will hold 46 trays of milk—42 in the main compartment at the rear, and 4 in the front alongside of the driver. The average route does not carry more than 35 trays stacked as shown in Figure X. This leaves exposed for the driver, the two front rows of trays.

Driving from the dairy to the route the salesman rides in a seated position. Having arrived at his route, he detaches the seat, leaving the space between both doors entirely clear.

The driver begins his deliveries by emptying the two trays on the front battery box, and leaves the empties right where they are. He then empties the two front rows of trays in the main part of the body, rows No. 1 and No. 2, Figure A. He then stacks these empty trays in the rear compartment, specially designed for this purpose, leaving his load as indicated by Figure B.

Next he empties the two front rows again and stacks them in the rear compartment, Figure C. Again the two front rows are emptied and stacked in the rear, leaving the operation as shown in Figure D.

Now the driver empties the first row on the floor (1) and leaves these empties just where they are, the rear compartment now being entirely filled.

The driver now takes three full trays from the top of the last row and places them on the top of the empties in the front, as shown in Figure E, and proceeds to empty the trays.

The final operation consists of moving the last row of trays forward on top of the battery box and the empty row of trays, and placing them in position shown in Figure F.

This now leaves 9 full trays of milk exposed for delivery without further movement.

You will note that the entire operation has been achieved without moving any full tray of milk or empty tray more than once. This is one reason for the speed and efficiency of this method of delivery, made possible by the body design of the truck.

FIG. F

You will note that not only has no tray been handled more than once but no trays need be left on the street to be called back for after the remaining trays in the wagon have been emptied.

Another contribution to speed is the Ward patented cut-in step. From Figure Y you will see that this cut-in step enables the driver to operate the truck from a standing position on the step. The controller lever, being on the left side of the steering wheel, enables the driver to operate it with his right knee or by hand. When he stops he merely shuts off the current and applies his right foot to the brake. In starting again he has only to place his foot on the trigger, which releases the brake, and then switch on the current.

In actual stop-watch tests against "horses that know the routes," this truck saves from 15 minutes to one and a half hours a day. Quick pickup and its wonderful handiness in operation are reasons for this.

The important savings made possible by replacing your horses and wagons with electric delivery vehicles deserves your careful consideration. Certainly you will want to have the facts about electric delivery—write for the Ward Electric catalog today.

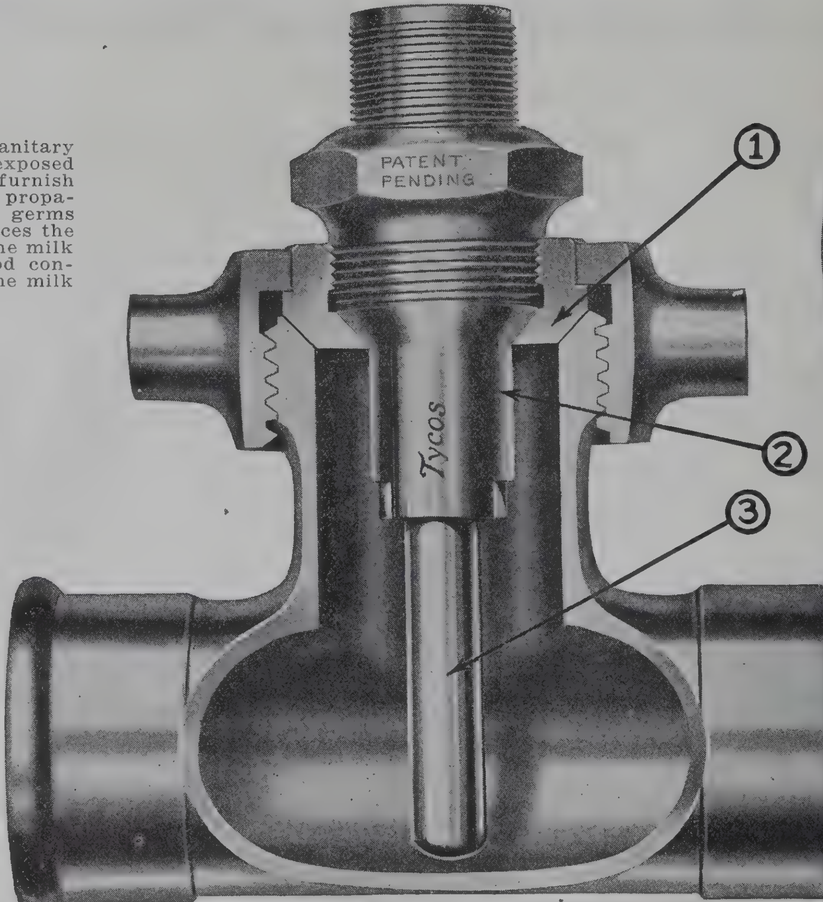
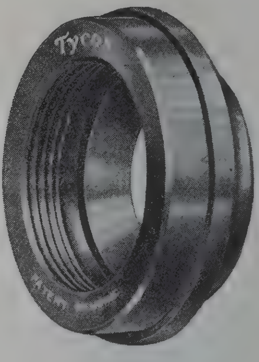
New *Tycos* Sanitary Method of Applying Thermometers and Regulators to the Milk Line

Prevents unsanitary pockets and exposed threads which furnish such excellent propagating places for germs and bacteria. Places the bulb directly in the milk line insuring good contact even when the milk line is not full.





The Ferrule

Thermometer or regulator bulb installed in milk line, using the *Tycos* Sanitary Ferrule

1— *Tycos* Ferrule available for use with sanitary fittings as adopted by the International Association of Milk Dealers and interchangeable with *Tycos* Instruments for indicating, recording and controlling temperatures.

2—Eliminates any threads or pockets which otherwise would be exposed to the milk flow, presenting a smooth, sanitary surface, easily cleaned. No place left for the growth of bacteria.

3—Bulb is not pocketed, as usually was the case prior to the development of this method of installation since the bulb of the instrument is brought down into the flow of milk, insuring good contact.

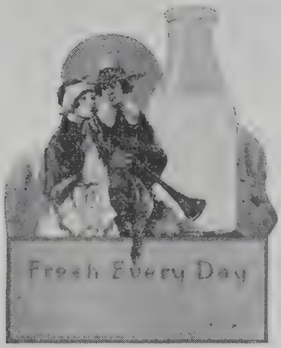
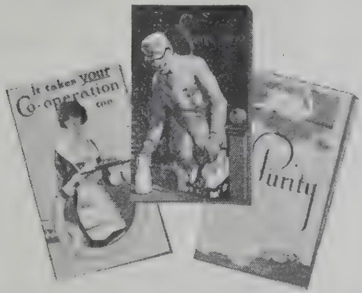
Giving YOUR BUSINESS a Personality —



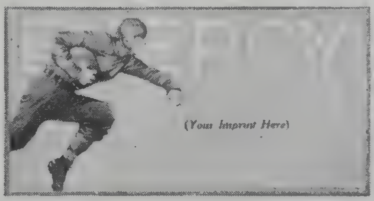
Fresh Every Day

ON the loading platform of your plant it is "*your milk*"—is it still "*your* milk" when it reaches the homes of your customers or is it just "milk"?



It takes your Co-operation
Purity

The answer to that question depends entirely on whether you preserve your identity clear through to the homes you serve. And it's a mighty important question because millions of gallons of milk flood the cities of this country every day. And if you're spending money to get good milk and to give good service, you can't afford to submerge the personality of your business in the daily Niagara of milk that pours out over the country.



(Your Imprint Here)

That's what advertising is for.

Never mind now about education. The purpose of advertising isn't to educate—it's to sell goods. And you can use it, if you like, to make *your* milk stand head and shoulders above the common level.

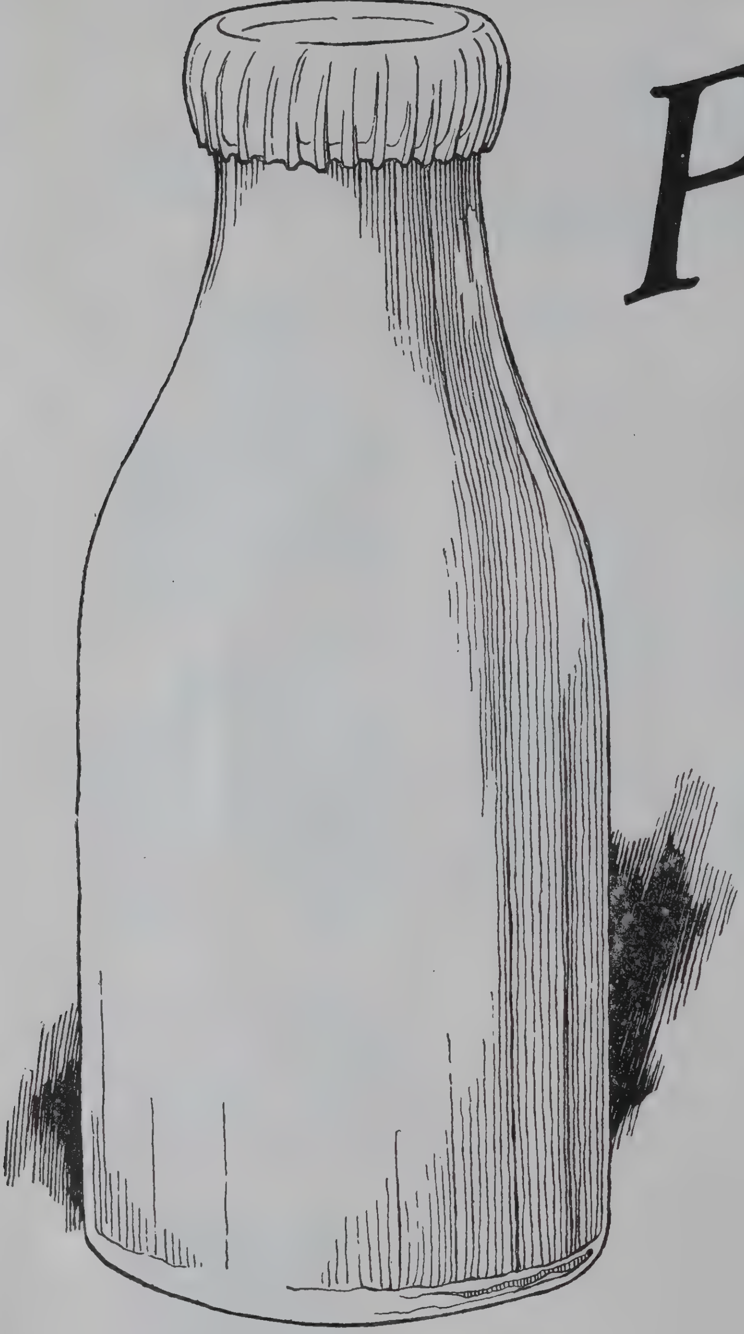
THE FARRAR ADVERTISING COMPANY

108 FULTON BUILDING :: :: :: PITTSBURGH, PENNA.



Protection!

THE Westlake one-piece sanative seal affords the most perfect protection to the contents of a milk bottle that has ever been devised.

It is a moulded cap made to shape in the AMF Automatic Milk Bottle Sealing Machine from discs of 5-ply spruce paper. The cap grips the under-side of the lip of the bottles tightly all around, making an absolute seal, and since it cannot be knocked off in handling or jarred loose it completely protects the milk against contamination from unclean hands, dirty ice or animals.

Yet a simple turning and lifting movement enables the customer to remove the cap. It may be replaced loosely as a temporary dust cover, but cannot be re-tightened and used as a seal again, thus protecting the consumer against tampering without instant detection.

The Westlake Sanative Seal requires no wires or other equipment to keep it in place.

Write for complete descriptive literature and prices.

More Years of Service at Less Cost Per Case

CLIPPER CASES

are a standardized product completely made of steel and sold at a standardized price.

Their correctness of original design is proven by the fact that through 20 years of manufacture they have never changed, never found need for addition or subtraction.

Repairs are an unknown quantity to the average user of Clipper Cases. Their one-piece metal construction for sides and ends and the manner in which division wires are fastened gives them indefinite life without repairs. A hammer to smooth out a kink now and then is all that is needed to keep Clipper Cases in shape.

Clipper Cases absorb no moisture and consequently they are not subjected to the effects that result from wood swelling, warping and drying out.

Clipper Cases have no projecting stacking irons, yet you can set them ten high and truck them around your plant and the stack will stay rigid and never sway.

More Clean Sterile Cans Per Hour at *Less* COST

Setting the Nation's Can Washing Standards for Efficiency and Economy

Machine values are determined by results obtained—not by the cost of materials and involved labor. Results are measured by the factors of *satisfactory performance, capacity per hour, cost of operation, durability and dependability.* And all of these, in the final analysis, are judged by comparison with other competitive machines.

Because L.-P. machines are washing, sterilizing and drying cans *better, faster* and *at less cost* than any other machines on the market, plus durability and dependability—they have justly earned their position at the top and have established can washing standards by which all other machines are now being compared.

Before selecting a can washer, just compare results point by point with L.-P. machines. Consider the condition of the delivered cans and operating costs (including labor required for equal capacities); consider the items of floor space, convenience of operators and flexibility of operating capacities.

As the buyer you are entitled to and should get the maximum values for your money. As the manufacturers of L.-P. can washers we invite the most critical comparisons on every point vital to washing efficiency and economy. Our sales are rapidly increasing because buyers are more insistent on results.

There is an L.-P. machine to fit the requirements of every creamery, milk and ice cream plant, regardless of size. Let us tell you what our machine will do for you.

World Wide Leadership Proves Its Superiority

THE MILLER HYDRO is the accepted standard of bottle washing machinery in every civilized country where beverages are sold. Over three thousand leading bottlers and brewers are the jury who settled this . . . . who pronounced the Miller Hydro flawless and perfect in operation

The same efficient machines, identical in principal, and with a cup arrangement that permits handling any size or shape milk bottles, are available to dairies, regardless of capacity.

The Miller Hydro Dairy Models speed up production; cut every overhead item in two; and give a steady stream of chemically sterile bottles without even the possibility of breakage. The continuity of operation with but one operator, in addition to the tremendous saving in labor, positively insures the correct timing of pasteurization.

Write us today for catalog and names of large dairies who have tested the Miller Hydro under every condition. Without obligation on your part . . . . let us supply full and complete information.

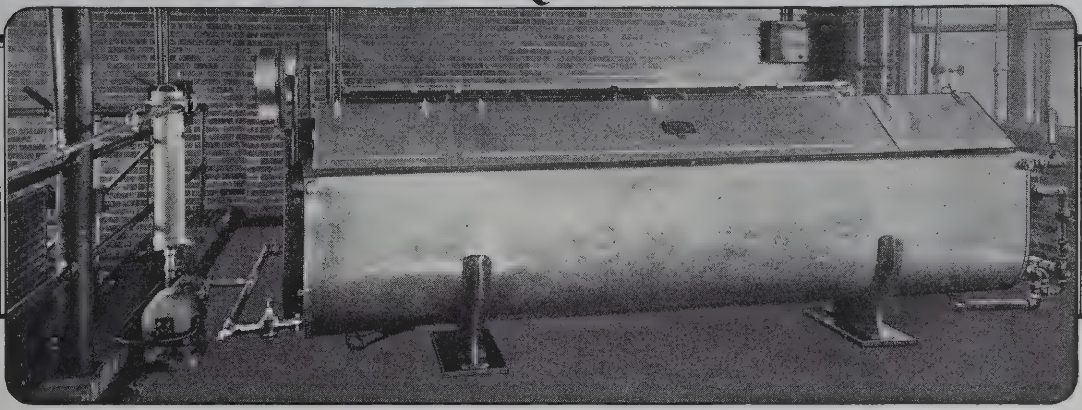
Another user of Pure Nickel DAIRY EQUIPMENT



Pure Nickel-lined Burrell-Simplex Spray Pasteurizers in E. E. Blain Dairy Co., Cleveland, O., manufactured by D. H. BURRELL & CO., INC., OF LITTLE FALLS, N. Y.

E. E. BLAIN DAIRY · CLEVELAND, OHIO

WHERE BACTERIA COUNT IS UNIFORMLY LOW

OLD-TIMERS in the dairy business know how much better the results are when modern equipment is used as compared with results secured when dairy products are handled in old-fashioned equipment. They know, for instance, that pure Nickel equipment turns out a purer product at a lower cost.

The E. E. Blain Dairy of Cleveland, writes—"Our milk has a fine flavor and our bacteria counts are uniformly low."

Users of pure Nickel dairy equipment confirm what most dairymen already know: that Pure Nickel

—safeguards purity
—promotes economy
—is easily cleaned
—lasts longer in hard service.

Pure Nickel is rust-proof and corrosion-resisting. It is strong and tough with no coating to chip, crack or wear off.

If you are asking yourself "how can I produce a better product at a lower cost" we suggest that you secure further information about pure Nickel. Ask your manufacturer or write direct.

Michigan Allied Dairy Association—Annual convention and exposition to be held at Jackson on February 7 to 11, 1927. Exhibit will be staged at Fair Grounds, five blocks from Hotel Hayes, which will be convention headquarters. Secretary, Lloyd H. Hughes, 1815 Franklin St., Detroit.

Dairy Products Association of Kentucky—Final meeting of the spring and summer season will be held in Cincinnati, O., on Wednesday, April 21, at the Gibson Hotel. Carlton Ball, 206 Republic Bldg., Louisville, is general secretary.

"ONE of the greatest fallacies of the milk industry is the continual hammering of those who should know better in tearing down the structure of it by non-constructive advertising concerning the qualities of milk. Why is it that those engaged in the business of selling milk continually hammer on such points as "impure milk," "clean milk," and others along the same strain that have a decided negative effect on the consumer?

An alleged advertising man, who is in the business of selling advertising material to milk dealers, receives the embossed pewter for having the zero thought of the month. The prize goes for the weighty thought incurred in preparing and attempting to sell a card with the following reading material: "Milk is more immediately absorbed by the system than any other food. If impure, therefore, it does more harm, and does it more quickly than most foods. * * You are sure of a clean, pure milk supply when you patronize our dairy."

The selling appeal of such an advertisement is nil. Certainly, it does not create a desire to drink milk, from the food standpoint, or any other; it does nothing to show the wonderful qualities of milk. It does, however, create the impression that milk is, in most cases, a dangerous food, and for this reason it will cause people to shy from using milk.

What other industry has had such an immense amount of detrimental advertising that the dairy industries have been the unwilling recipient of? It is true, that milk is not always as it should be, but such cases are constantly decreasing, so that at the present time, milk from most plants is "pure." (The word "pure" is not ours, for we are still uninformed as to the meaning of "pure" milk). Destructive advertising of the type quoted above will never do anything toward the advancement of the milk industry.

In other industries, there have been many cases of food poisoning, but, aside from an occasional mention in the papers when enough people are incapacitated the majority of us never become aware of such occurrences. Canned goods have been known to sicken and even cause fatal results to those using the products, but no one can recall an instance of one manufacturer in the canning industry advertising that his goods were "pure" and "clean" and would not cause food poisoning.

The milk industry has had more than its share of destructive advertising. It is time for everybody within the industry to use some reason in their publicity work, for it is far better that no advertising be done rather than the kind that shakes the confidence of the people in the product. A constructive policy is needed for the industry, and a law against the wiseacres who are destroying its standing.

◆

IT WAS a glorious convention in Detroit this month. Men interested in selling milk and milk products gathered from everywhere. They worked, planned and played. They got a better conception of the magnitude of their industry and its importance to society. They are better business men, better citizens as a result of their investment in time and money.

To say that it was the best convention of the International Association of Milk Dealers ever held is putting it mildly indeed. That organization always holds the "best" convention because each one is an improvement over the ones that have gone before.

The International Association of Milk Dealers is a wonderful trade organization. It has gained its place among similar trade associations because it is a working institution. The men behind it are not content with holding conventions. They are working and planning twelve months in the year to advance their industry. The annual convention is just an incident in the year's activities—a sort of clearing house, a time when everybody gets fresh enthusiasm for another year's work. The association is well officered, always has definite ob

MID Ag
v.16

jectives in view and is always well supported by its members. Why? Because they believe in it.

Yes, it was a wonderful convention and we have pointed out some of the reasons for it. The next one will be still better for the same reasons.

* * *

"MY MILK business, plant, machinery, equipment and all, including rolling stock, is worth twenty-five thousand dollars," said a milk dealer the other day. "Yet I wouldn't take $100,000 for it."

"You count in a lot for good-will, eh?" suggested a friend.

"Good-will—oh, yes, something for good-will, but not that much," he replied. "I have something worth a very great deal. I know good-will is vastly important, but I have something that I believe to be even more important. They are a half dozen of the best driver-salesmen you can find anywhere. It has taken me fifteen years to get just the right combination and then train them properly, and during that time I was ready to get out of the business a dozen times; to just throw up my hands and holler, 'Through!' at the top of my voice. But now that I have the right combination I know half the battle is won. I believe now I am going to make some money.

"Oh, I know it sounds funny to hear a man say, after fifteen years in business, that he expects to make some money, but that's a fact. Why, there are people in this town who think I am rich, and they would be very much surprised to know that last month I made two trips to my bankers—one to get a note renewed and another to get another loan.

"But now, for the first time in my life, I am sold on the milk business. I thought this happened to me several times. Once, when a lot of new machinery came upon the market and I fought it off till I couldn't any longer, I took it on and then decided by troubles were over, for that new machinery made it possible for me to handle far more business than I ever dreamed possible. Then I found out there was something lacking yet.

"Better rolling stock came upon the market, and pretty soon, when I found I could cover more routes than I ever did before—far more—I just felt it in my bones that I was ready to ride high and make some money. But still there was something lacking. Then I found out what it was; I found out that no one single force can make a milk business successful; it takes all-round development. No matter how good your machinery and your rolling stock may be, if you haven't the right kind of men handling them, you're sunk. A dumbbell on the top of a $2,000 milk conveyance can make your business look like ten cents.

"Yes, sir, I have the combination now. The right kind of driver was my missing link, and now it is complete and I am going to make some money. That's how firmly I believe in good drivers."

It's his story, and we are passing it along to you for whatever interest it may be. You don't have to agree with him altogether, but if you are wise, you won't say he is wholly wrong. Not altogether.

VISITORS to the Detroit convention took advantage of the opportunity to visit the Dairy Industries Exposition. They were unanimous in their approval of its beauty and completeness. Everything to delight and instruct the milk distributor was there. It was almost bewildering in its variety and magnitude. "It's as good as a college education" one enthusiastic delegate claimed. Anyway, he voiced the general sentiment.

The men who put on the exhibition are to be congratulated. They builded well and it goes without saying that they were encouraged to build even bigger next time. The Dairy and Ice Cream Machinery and Supplies Association made a real contribution to the development of the dairy industry.

* * *

SPEAKING before the annual convention of the American Grocery Manufacturers' Association, Assistant Secretary of Agriculture R. W. Dunlap, discussing food law enforcement, said:

> Your business, like every progressive American business, depends on retaining public confidence. The business of the United States has been built upon this basis. It has grown because people have had confidence in its integrity and in the principles of service which it professed. The requirements that have been enacted into law are not arbitrary ones. They are based on the same principles of service that American business professes. The weakening of them or even the attempt to weaken them will mean suspicion and distrust on the part of the public. This is something that American business cannot afford, nor do its best representatives have any desire to permit such to develop. The business man who looks for steady, consistent profits and for the development of his industry over a long period of years realizes that the results at which he aims can be accomplished only through the support of the public.

We are sure that men in the milk bottling and distributing business will endorse the sentiments expressed in the above. The enforcement of city milk ordinances has given the public a degree of confidence in milk that could not have been builded in any other way. These ordinances are sometimes impractical and sometimes dishonestly or inefficiently enforced, but time generally irons out all their bad features. The result in the long run is a strengthened confidence in the milk supply

* * *

"THIS is the hardest, most grinding and most nerve-wracking business in the world." Sounds like a quotation from a milk dealer's earnest speech to a friend, doesn't it? You're wrong; it's a newspaper quotation from a delegate to the laundry owners' national convention, just recently held. It made us chuckle, and we resolved then and there to pass along this little bit of information for whatever peculiar comfort it may be to our readers.

Funny, but it does make us feel good when we stop and reflect that we, after all, aren't the most down-trodden people in the world. No matter how much of the milk of human kindness may flow in our breasts, no matter how sympathetic and considerate we may be about fellow human beings, it does sort of give a fellow a little cheerful feeling to know that other men in trade have their troubles and that they are just as bothersome as ours—possibly much more so. Who knows?

Convention Breaks Records at Detroit

Largest Attendance in History at Twentieth Annual Convention of International Association of Milk Dealers

THE convention of the International Association of Milk Dealers, which was held at Detroit, October 6-8, was not a convention as the ordinary attendant would look upon one. For, from the time that the gavel announced the opening of the first session until the final business session, which went far into the night of October 8, the time was consumed in matters pertaining to the welfare of the milk industry.

Approximately one thousand members of the association attended the meetings in the automobile city, which not only marked the largest attendance of any convention held by the association, but it is also safe to say that the delegates displayed greater enthusiasm and exhibited a greater attention to meetings than in any other of the previous nineteen sessions of the association.

Kullman Elected President.

F. H. Kullman, vice-president of the Bowman Dairy Co. of Chicago, was elected president of the association. Mr. Kullman was the past vice-president of the association, and because of the illness of the president, S. O. Dungan, it has been his lot to assume the presiding chair of the association frequently during the last year. Mr. Kullman will now take the chair in his own right and, from the experience that he has gained, he is well qualified to direct the affairs of the association.

Other officers elected were: P. D. Fox, Borden's Farm Products Co., New York, vice-president; W. B. Wanzer, Sidney Wanzer & Sons, Chicago, treasurer; R. E. Little, Chicago, executive secretary. In addition to F. H. Kullman, W. J. Kennedy, A. F. Bird, L. A. Van Bomel and K. V. Lipscomb, who have served as directors during the past year, four new men were elected to the board. They are: P. D. Fox, W. B. Wanzer, S. M. Ross and J. M. Carruthers.

From the Past President

Past President S. O. Dungan, who is recuperating at Leesburg, Ind., listened to the program which was broadcast from the convention banquet room at Detroit. A message addressed to him over the radio was heard by him, and he addressed the following message to the convention in session:

"We heard every word of Oscar's greeting. Touched us deeply. Very much appreciated."

MR. AND MRS. S. O. DUNGAN.

Another received later in the evening was:

"We are hearing every word of your program and enjoying it immensely. You certainly are a noisy bunch. The first sound we heard was Charlie Hood's voice and his inimitable laugh. Love to everybody."

Reports Adopted.

In the closing business meeting, the report of the committee on the standardization of equipment was adopted. In their report, the committee told of the work that they had accomplished with the manufacturers of thermometers in obtaining a standard spud for glass lined tanks. It was brought out that all of the manufacturers had approved of the specifications as laid down by the committee.

Another report of much interest to the milk industry, was that of the committee working on the standardization of milk bottles. According to the report, the manufacturers of milk bottles have practically standardized on three sizes of bottles. In the report, it was brought out that the present type of half-pint bottle has been a source of inconvenience to the industry, and an endeavor will be made on the part of the association to increase the size of the base of the bottle.

The report of the committee working with the agricultural colleges to place greater stress on the merchandising of milk was also approved by the convention. In the report it was shown how the association

HIRE STAND
MAJESTIC
TRUNKS

Some of the Delegates to the Convention of the International

could be of benefit in improving merchandising methods by acting in closer co-operation with the colleges and through scholarships.

Aim at Medical Schools.

Calling upon Dr. E. V. McCollum, as the authority of the statement, the committee on resolutions took a slap at the medical schools for their laxity in giving recognition in their curricula of the wealth of facts pertaining to the vitamine content of foods, and the importance of vitamines in promoting health, growth and prevention of certain diseases.

In the resolution, which was adopted by the convention, the committee pointed out that Dr. McCollum thought it was within the province of the International Association of Milk Dealers to initiate this work in gaining recognition.

Other important resolutions adopted were:

WHEREAS, The question of efficient and proper commercial pasteurization of milk and milk products is of vital importance to the industry and public health, and in view of the present unsettled condition in regard to temperature and holding time,

BE IT RESOLVED, THEREFORE, That the plant management section recommend to the executive committee that a careful study be made of commercial pasteurization for the purpose of collecting and establishing authentic data and scientific facts which will be available to the members of the association.

* *

WHEREAS, It is generally conceded that pasteurization consists of heating milk to a temperature not lower than 142 degrees F., and holding same at this temperature for thirty minutes,

THEREFORE, BE IT RESOLVED, That the International Association of Milk Dealers, in convention assembled, recommends that the Committee on Standardization of Equipment of International Association of Milk Dealers, investigate this matter, using such assistance as it may deem necessary to determine what types of equipment will provide that all the milk in any part of the equipment is held at a temperature of not less than 142 degrees F. for not less than thirty minutes.

F. H. KULLMAN,
Newly Elected President.

Many Interesting Subjects.

Those attending the convention had a wealth of enlightening and informative subjects upon which to listen. As in the past, general subjects of interest to all were assigned to the general section; while those interested in matters pertaining to the laboratory, to the plant, to accounting, to production and to sales and advertising had an opportunity to hear papers and discuss their angle in separate meetings. It would be hard to say if there has been more talking in the Book-Cadillac Hotel in its short history, but certainly there has never been discussions that have been of greater interest to the listeners, or have there been more constructive subjects discussed.

Members of The International Association of Milk Dealers went to Detroit to discuss their business and to learn from others. The sessions started early in the morning and they lasted into the night. However, they know the old adage anent all work and no play, and those arranging the convention realized that pleasant memories of the "City of Straits" by the visitors would be as essential as the knowledge that they carried away in regard to their business. Accordingly, they arranged a banquet on the second night of the convention that caused those attending to forget surplus, breakage, and the other bugaboos of the operation of a milk plant. It would be trite and inexpressive to say that each one at the banquet enjoyed it immensely, but suffice to say indigestion is either unknown among members of the milk industry, or the committee arranging the banquet met everyone's liking.

Excellent Program.

After the banquet, a program was arranged. However, before proceeding with the entertainment, a message of greeting was broadcast to S. O. Dungan, president of the association, by C. O. Ewing. Mr. Dungan has been ill for some time past and is now recuperating at Leesburg, Ind. He later wired that he heard the greeting and all of the program, which was broadcast.

With a seemingly inexhaustible supply of stories,

TEN PAY PLAN
SHOPPE

Association of Milk Dealers at Detroit, October 6, 7 and 8.

James Schermerhorn started the program and set a standard for entertainment that appeared difficult to maintain, but those who had doubts regarding the ability of the rest of those on the program after the nationally known humorist has finished, did not reckon with the talent that is available among ranks of those working in the milk plants of Detroit, for the entire program was composed of talent from the local plants, and had not their connections been printed on the program, the delegates would have been none the wiser that they had not been selected from the theatrical profession.

The committee in charge of the entertainment left nothing undone, for after the excellent program offered to the banqueters, a dance that lasted far into the morning was given, but if there was any sign of weariness on the part of those who participated in the evening's festivities at its conclusion it was not evident to the casual observer. Truly, one need but little further evidence that milk makes a hardy and robust people.

Dairy Industrial Exposition a Winner

Biggest Display of Dairy Plant Equipment and Supplies Ever Staged Wins Approval of the Industry. Over 9,000 Delegates Register

A GLITTERING display of brass, nickel, copper and glass. A display that gladdened the heart of anyone connected with the dairy industries. Such was the immense display of machinery, equipment and supplies at Convention Hall at the Dairy Industries Exposition, which was held at Detroit, Oct. 6 to 14.

To the man who has grown up with the industries, the exhibits, no doubt, brought back memories of the material that he had to work with in the past. One kindly old chap was seen to look on the display with amazement, and then a far-away look stole into his eyes. Perhaps he was thinking of the labor-saving and product-improving tools that are available to those in the industries at the present time, and those that he had in bygone days. Perhaps he was thinking of the strides that the dairy industries have taken within a short period of years, and the exemplification of the strides as shown by the displays. Perhaps he was thinking of a few years back, when the displays on such occasions were few, and the attendance did not run into the thousands.

Changing Times.

All of these thoughts could enter the mind of the "old-timer," for the exposition of machinery, equipment and supplies was huge. It was by far the largest display of dairy equipment ever shown, and no one would have thought a few years ago that there would be over 300 exhibits, valued at approximately one million dollars, displayed at one time under a single roof.

Perhaps the average layman would not think that

Views in the Different Halls at the First Dairy Industries Exposition.

the exhibits were beautiful, but to those engaged in the industries they were wonderful and exceeded anything that has ever been staged. Every possible piece of equipment, machinery and supplies known and used in the industries were shown, and to the lover of machinery and mechanical finery the display was as inspiring as the work of the old masters to the artist. For he was in the very midst of things for increasing the efficiency and improving conditions where he worked and the product which he manufactured. It was an education that he will not be apt to forget. It was an opportunity for him to meet the manufacturers (whom he found to be fine chaps) and through their explanations of the goods that they had on display to learn of all types of equipment. It was an opportunity for him to learn something of the tools used by all of the dairy industries. In brief, it was an opportunity for him to gain a cross-section of the dairy industries.

Large Number of Innovations.

As usual, there was the great number of innovations and improvements that are brought out at this time, and although it may have been due to the great number of products on display, it seemed that there was a greater number of new things being offered to the industries.

Every available foot of floor space was taken by the exhibitors, and those who know the tremendous size of Convention Hall can gain a very good conception of the massive proportions that the exposition assumed. Many who were unable to decide until late whether they would have an exhibit were forced to take any small space that could be spared by exhibitors, and in no instance could an opinion be found that did not voice approbation of the exposition. Certainly, it was a great success from every standpoint, and the feeling seems to be for a continuance of the present policy.

On the whole, the exposition was well managed. Every exhibit was in position on the opening day, and the machinery of operation ran smoothly until the end. Each day the halls were promptly cleared at closing time, and all of the rules of the exposition were lived up to by the exhibitors. One night was devoted to those on the outside who wished to visit the hall.

Manager Everett and his corps of assistants may well feel proud of the success of the First Dairy Industries Exposition.

Wanted—Silent Deliveries

The Merry Jingle of the Milk Bottle May Be Music to the Delivery Man, But Not to the Apartment Dwellers

RECENTLY, one of the large newspapers editorialized somewhat facetiously concerning the complaint made by some of the members of the "Gold Coast" in the city of Chicago, in reference to the noise made by the milk wagons on their early morning deliveries. The editorial went on to state that these suburban residents were making bitter complaints and were agitating a movement for noiseless wagons and silent horseshoes.

The writer of the editorial poured out his sympathy for the complainants who were unable to concentrate on their bridge game, due to the early morning racket, and others who could not go to sleep, inasmuch as the noise began about the time that they were ending another day. On the whole, the matter was treated very lightly, and, aside from a bit of humorous reading matter, it is quite safe to say that very few gave the matter further thought. However, it does give rise to a pertinent matter that should be given consideration by every milk dealer; for, seemingly, there are many complaints concerning the noise made by the men making night deliveries—some of them being complaints arising from some who are such believers in the adage "that one hour of sleep before midnight is worth two after," that they even go so far as to put it to practice.

Perhaps, had not the writer of this started the day with a grouch against all milk delivery men, he would feel inclined to smile with the others who read the editorial in the newspaper and dismiss the matter as lightly as most of them. However, he was disturbed, while not absorbed in four no-trump or in honors, and neither had he been interested in learning what time the sun appeared in the East. To put it plainly, he had been wrapped in the sleep of the innocent for some hours when he was rudely awakened. Not by the iron shod feet of a delivery horse, but instead by the leaden footsteps of the milk delivery man.

A thump, thump, thump, accompanied by the unmusical jingle of milk bottles against each other in the carrier. A servidor is opened, the empty bottles clank into the carrier, the full bottles are put into the servidor—none too softly—the door of the servidor is slammed shut, and the thump, thump to the next apartment where the performance is repeated. Some time later, we hear him make his last delivery in the building, and we turn over hoping that we would be more successful than Macbeth. Forty-five minutes later we arrived at the stage where we were on the verge of proving that our conscience was clearer than the Shakespearian character, when we were brought out of our pleasant haze by a thump, thump, thump, very much like the first, only heavier. Again the business of rattling milk bottles and slamming of doors; while we softly cursed and berated our luck that we were not living out in the great open spaces where early morning deliveries are unknown, and milk is taken on the hoof.

Why go into the terrors and agonies of that night? Three companies deliver milk in our apartment, and by some fiendish chance, each delivery man makes his deliveries one hour apart from the other—and, seemingly, each tries to outdo the preceding one in noise.

Seriously, with the great number of people that are living in apartment buildings, there is room to improve conditions regarding milk delivery from the standpoint of the annoyance that it causes this class of dwellers. It is unreasonable to expect that the delivery man can distribute the milk as noiselessly as a second-story worker, but certainly many of them can take more precautions in the elimination of noise. Undoubtedly, few people will appreciate the effort that a man makes in this respect, inasmuch as he will be unaware that the man is making an effort to extend service to this extent. However, let him be awakened by a careless employee who delights in the early morning music of the milk bottle, and the deliveryman will conclude that silence is the best form of appreciaton.

Electric Trucks Reduce Delivery Costs

Current Costs Less Than Horse Feed and Tires Cost Less Than Horseshoes

By C. L. PRUHN*

IN A RECENT article published in this magazine under the caption of "Trucking Electrically and Otherwise" I dealt with the most practical and economical type of delivery equipment to use on various kinds of routes showing the various fields in which the horse-drawn vehicle, the gasoline truck and the electric truck could be operated to the best advantage from an economical standpoint. In this article I will deal with the advantages of the electric truck in two similar types of work, the delivery of milk and ice cream.

It is a very fortunate circumstance that the usual delivery route of the milk dealer and ice cream dealer is so practical to the use of electric trucks. We know the many ordinances complied with in the handling of milk and ice cream and the many precautions taken so that these products reach the consumer as pure and good as possible. We all know that the most essential item in keeping the good will of our customers is the purity and wholesomeness of our product. The electric truck is the cleanest and most sanitary type of delivery equipment known and as I said it is most fortunate for the milk dealer and the ice cream dealer that their usual delivery route is of such length and requires so many stops that we find by comparative analyses the electric truck the most efficient and economical type of equipment to use on most of these routes. I mean by this that the cost of operation is less on the electric truck for this work than any other type of delivery and that the electric truck will do as much if not more work of this type in a day than any other piece of delivery equipment.

How many firms using horse-drawn vehicles in their delivery equipment figure their delivery costs accurately. The failure of executives to figure these costs properly is taking thousands of dollars out of their profits each year. How many include every item that should be figured which are—

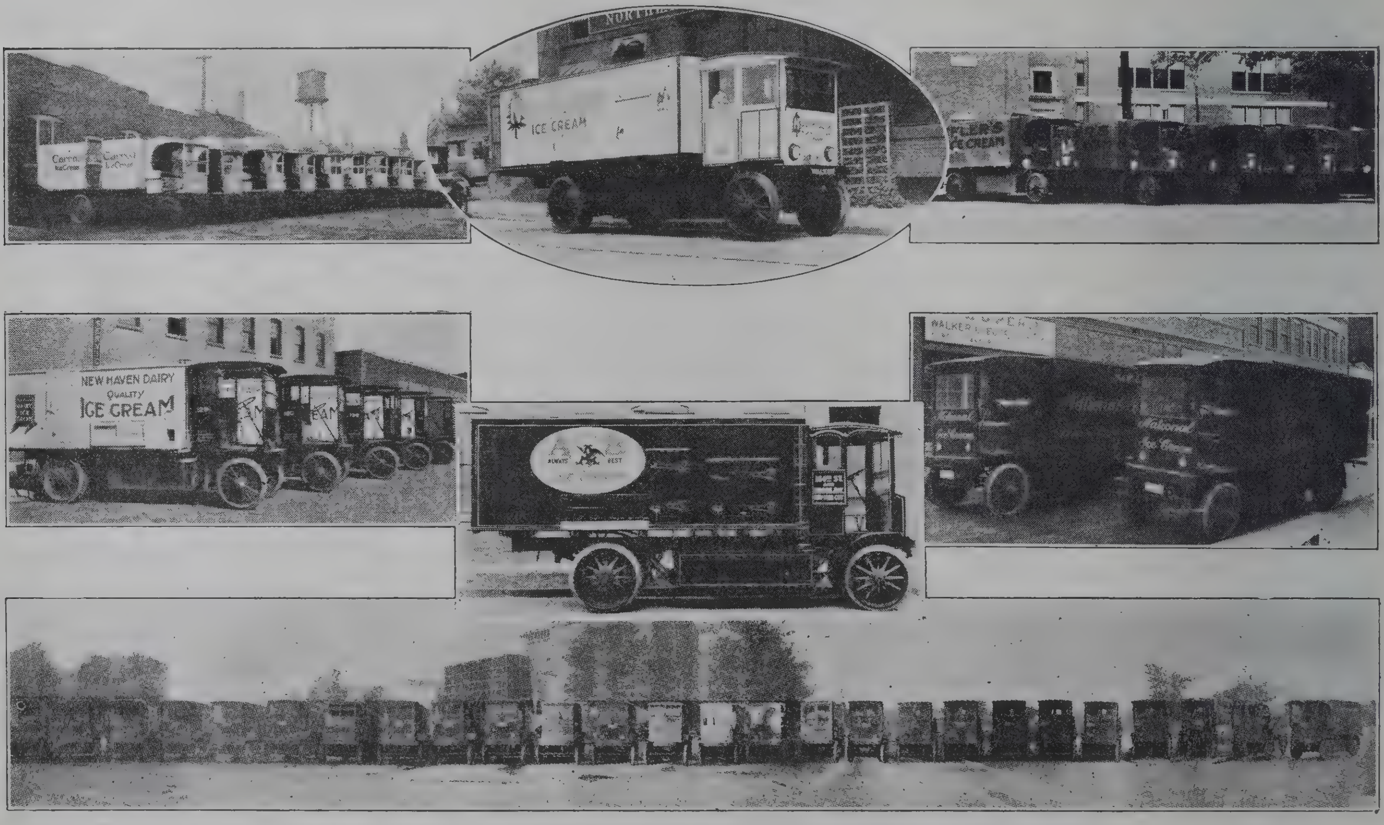
—the investment in land, in stables, wagon sheds, harness rooms, hay lofts, etc.
—the investment in horses, wagons and harness, taking into consideration that the average life of horses in delivery services is five years (only four years in very large cities).
—the interest on investment and the upkeep and depreciation on the buildings.
—the replacement cost of horses.
—the upkeep and depreciation on wagons, harness, etc.
—the number of miles he can and cannot travel.
—the loads he can and cannot haul.
—the cost of feed, bedding, shoeing and care (for the horse eats and has to be looked after whether he works or not).
—the number of extra horses required to take care of the extreme heat of summer and blizzards of winter, sickness.

It costs less for current for an electric than it costs to feed a horse covering the same mileage and it costs less for tires than it costs to keep a horse in shoes doing the same work.

We must not forget that horses have to be fed and cared for whether they work or not—on Sundays, holidays and when not in use due to dull seasons.

From the insurance standpoint electrics cost less than horses and wagons doing the same work when we take into consideration the insurance on buildings required for housing as well as the equipment itself.

Take into consideration the amount of space required for horses and wagons as compared to that required by



Trucks in use by ice cream manufacturers in various parts of the country.

---

* Assistant manager, Automobile Bureau, New York Edison Company.

electric trucks. In doing away with a stable you do away with fire risks, contaminating odors and dirt.

The executive who is operating electric trucks on short city routes with many stops is paying bills for actual work done as when the electric truck stops in traffic all its operating costs stop. It is impossible in a working day where so much time is occupied in making deliveries and stopping in traffic congestion to cover any greater distance than the electric truck has capacity for or even in some large cities where traffic is unusually congested to cover any greater distance than you could on a bicycle or pushing a push cart.

The electric truck has its distinct field in transportation and wherever it is performing work which is within its operating radius it is a much more economical proposition to operate, is more reliable due to freedom from street breakdown and does not necessitate as many days out of service during a year due to lost time for repairs. However, aside from the cost of operation the electric truck is as sanitary a type of delivery equipment as is known to use in the delivery of food products and the man handling the electric truck who is your personal representative with the public can keep his own personal appearance neater and cleaner than the man operating any other type of delivery equipment.

The main reasons why an electric truck is more economical to operate than other types of delivery equipment are:

1. Reliability.
2. Simplicity of construction.
3. Long life.
4. Low insurance rates.
5. Few repairs.
6. Easier on tires.

Ice Cream Delivery.

The electric truck is admirably suited to the delivery of ice cream, in most cases due to these reasons:

1. Sanitary and free from odor.
2. Clean to protect the personal appearance of driver.
3. In most cases fairly long stops are made at points of delivery as in unloading ice must be dug out to remove containers of ice cream. This loss of time limits daily mileage.
4. Practically all city routes in the ice cream business are very short due to the necessary amount of ice and salt carried which leaves a limited amount of space for the product itself.

Inasmuch as the city routes are well within the field of electric truck work, therefore, from a cost standpoint the electric truck is more adaptable for the work than any other type of truck for reasons I have already cited.

Due to the ability of the electric truck to cover more mileage than horses in this work the capacity per vehicle can be increased by the use of electric trucks and therefore fewer electric trucks can do the work done by a greater number of horse-drawn units.

Wholesale Milk Delivery.

The electric truck we find adaptable as a type of delivery equipment for the same reasons given in ice cream delivery work.

In summer an average of 60 to 70 cans of milk are carried to each load and it requires 4 or 5 cakes of ice which weigh 300 pounds each to keep this milk at proper temperature. Each 40 quart can of milk weighs 110 pounds. Case goods are also carried on these routes. Each case of milk properly iced weighs approximately 75 pounds and very often 25 or 30 cases are carried on a load. These are quite heavy loads and the resultant hard work on horses makes it necessary to keep in work many spare horses. With these necessary spare horses and the advantages in saving of stable space the electric truck is more economical to operate than the horse-drawn unit and when we consider the additional work possible by the use of electric trucks and the resultant fewer pieces of delivery equipment necessary to operate we find the electric truck much more economical than the horse-drawn unit.

In comparison with other delivery trucks we find the electric truck more economical to operate in this work for the same reason as given in the ice cream delivery work. An average route in this kind of work generally takes from 8 to 9 hours to cover due to length of time lost by delivery stops and traffic congestion.

Retail Milk Delivery.

In large cities where apartment houses mean short routes which sometimes in extreme cases cover only 2 or 3 blocks I believe the horse-drawn unit to be the most economical to operate. It is, however, possible to show economy by the use of electric trucks in cities such as New York where by using electric trucks branches which must be operated when using horse-drawn units can be eliminated.

Electric trucks do, however, show to advantage in suburban towns and smaller cities where the route mileage is greater and the stops farther apart. Generally speaking, in this type of work it costs a trifle more to operate one electric truck than a single horse wagon but the electric truck on this type of route is capable of doing 20 per cent more work thereby cutting down the number of routes and with these fewer routes bringing the points per route up to a higher figure which will show real economy.

The horse advocate always speaks of the advantages of the trained horse being able to follow the route and so assist the driver. This is true but isn't there another side to this to be considered? Mr. Driver goes into Mr. Smith's house with the usual delivery and his horse continues alone down the block, expecting Mr. Driver to go along the back yards with his carrier and meet him four or five houses down the street. Mrs. Smith happens to be giving a party that afternoon and wants two extra bottles of cream so Mr. Driver has to go down four or five houses to reach his wagon and retrace his steps to Mr. Smith's house to deliver the extra order.

Saving in space of stable—here again is a factor and also the elimination of stable noises and odors.

⁂

OHIO PLANT REMODELED.

The plant of the Hosler Dairy, Toledo, O., is being remodeled and modern equipment and refrigerating machinery is being installed.

The Hosler Dairy has enjoyed a steady growth since A. J. Hosler reopened his dairy plant at 522 Sandusky St., three and one-half years ago. Mr. Hosler has had wide experience in pasteurizing, bottling and distributing milk products and his chief aim was to procure and deliver a grade of milk above the average in quality, to comply with every rule of sanitation demanded by the division of health, and to give service to all that was absolutely reliable and dependable.

The fact that Hosler products are now being distributed on 15 routes throughout the city and that Hosler milk has a high average of butterfat are remarkable testimonials that A. J. Hosler has succeeded in carrying out his aims and policies.

The future of this concern looks bright, with a firm foundation to build on, its reputation as a distributor of rich milk and its certainty to continue the policies upon which the business has been founded.

The Hosler Dairy has adopted a clever and attractive slogan—"Buy and Try the Best by Test"—which can be seen on all advertisements and on its wagons and trucks.

WHY THE MILK INDUSTRY NEEDS NATIONAL ADVERTISING

By H. K. DUGDALE*

IT HAS been my pleasure and privilege during the past five or six years to have devoted most of my time to a careful study of the application of modern advertising and merchandising methods to the various branches of the dairy industry, particularly the business of milk distributing.

H. K. DUGDALE.

In an effort to arrive at worthwhile conclusions in connection with the milk business, however, I have not considered it alone, but always in relation to, and in comparison with, other businesses rendering an equally important and valuable service to the public.

There are no doubt many businesses in America today to which the great force of national co-operative advertising could be applied with beneficial results. But to my mind there are two important industries in which the need for national co-operative advertising is most marked, namely: The lumber business and the milk distributing business.

Let us consider the lumber business first,—because it may enable us to more clearly picture the need for, and the application of, national co-operative advertising in the milk business. While it is true that there are many different types of lumber, and as many different grades of each type, it is also true that the lumber business as a whole is very closely knit and well organized.

The question of national co-operative advertising has been under consideration in the lumber business for a long time. It is generally understood that such a campaign is contemplated for the near future. But in the meanwhile, what has happened? Various producers of various kinds of lumber have conducted national co-operative campaigns for the sole purpose of pushing to the front the particular kind of lumber in which they happen to be interested because they produce it.

For instance: The Oak Flooring people have conducted a national campaign. So have the Douglas Fir producers and likewise the Cypress growers. There have been others, each competing with the other in a certain clearly defined market.

In the meanwhile, manufacturers of various lumber substitutes have sprung up; have entered the national advertising arena, and have built up giant businesses, almost over night.

The business of manufacturing and marketing lumber substitutes has grown in the past few years at a much greater rate than has the lumber industry as a whole.

What do you think would have been the result if various branches of the lumber industry instead of engaging in competitive selling warfare had united in one gigantic campaign to sell to the country as a whole the idea of the outstanding value of lumber and the necessity of preserving one of America's largest and most important industries?

Milk Dealers Have Had Wrong Slant on Competition.

And now we come to the milk business! It is my firm conviction that the average local milk dealer has had the wrong slant on competition. He has been watching his local competitor and fearing him to the point where he has overlooked to a large extent the general competitors of the milk business as a whole. He has sought growth and expansion primarily at the expense of his competing local dealers in much the same way as the local commercial laundry used to seek business before the laundrymen were taught that the best and surest way to increase business was to increase and broaden the general demand for the service the laundry had to sell.

It is generally recognized that the Coca Cola Company is an outstanding success in the soft drink business of America. How far do you suppose the Coca Cola Company would have progressed if each bottler in each community ran competitive advertising in an effort to direct business to his particular shop instead of merely tying up with the one big national movement sponsored and conducted by the parent organization?

Some of my readers are probably beginning to ask the question—"Who are the milk dealers' competitors?" Just like the lumber dealers' competitors, the milk dealers' competitors are the manufacturers of products used instead of bottled milk, for example: Condensed, evaporated and powdered milk and various food products and drinks (including tea, coffee and other drinks consumed at meal times) most of which are nationally advertised and nationally distributed.

That is an important point to consider, and here is the reason.

When we consider the increase in population in America in the past ten years the increase in buying power of the American public and the increase in the consumption of bottled beverages, confections, drinks for household table consumption, substitutes for bottled milk, we are forced to admit that the business of the

Editor's Note:—Mr. Dugdale has for a number of years played an active part in the advertising and merchandising of products closely allied to the dairy industry. In the national campaign he has directed for The Stone Straw Company, Sealright Company, Incorporated, and Thatcher Manufacturing Company, he has sounded a new note in the national advertising of milk. In his numerous articles on dairy advertising he has constructively criticised hundreds of milk advertisements. His observations on the much discussed question of association advertising are well worth considering.

---

* Vice-President, The Green & Van Sant Company; advertising counsel, Baltimore, Md.

milk dealer has not increased in proportion and is in fact way behind the procession.

Not only do I believe most firmly that the milk distributing industry has something to sell but I believe that it has more to sell than the distributor of any other food product, beverage, or table drink in America, and that national advertising in sufficient volume and with sufficient human appeal can be made to pay from the very start.

Selling the Milk Idea.

The average successfully planned advertising campaign has one or all of the following three things to do:

(1) To sell more of the thing advertised.
(2) To insure against a future decline in sales.
(3) To insure the advertiser his relative position in the field in which he operates.

Regardless of which one or more of these the milk industry is interested in accomplishing, it is nevertheless true that it must be done by selling the public the milk idea and in keeping them sold to that idea.

I have heard it said that "the public is a funny animal." If you analyze this thing called "the public" you will realize that there is nothing funny about it at all. The public is a very natural, normal human thing. It is merely you and I and our families and friends, **multiplied**. It is just humanity under a magnifying glass—humanity with all of its human feelings and emotions.

America is made up of average men and women. There is only one way to sell an average man or woman anything, namely: Tell him what it is going to DO for him, not merely what it is.

In the case of milk, the public must be told why they should drink milk instead of the other things they are are now drinking or eating or being urged to eat and drink. People drink milk when they are babies because nothing else is ever offered to them. They drink it when they are children because they are forced to, and unfortunately when they reach the age of reason, so called, they generally discard something that is actually good for them for something that is positively harmful.

Milk Dealers Render Great Public Service.

There is no doubt whatever in the mind of the forward looking American citizen but what the pioneers in the milk distributing business of America today have rendered and are rendering a great public service; that many of them are inspired and actuated by lofty ideals of service, and that the public generally would be in a pitiable situation if those things were not true.

But if the milk dealers of America were to conduct a campaign of national advertising built around their own greatness and permeated with talk about "great public service" and "idealism" they would fall far short of reaping the rich reward to which they would be otherwise entitled and would fail to pass on to the public the benefits which will accrue to it through a greater use of milk. Such a campaign will not make drinkers of stimulants switch to milk.

The great public service rendered by the nations' milk dealers should be touched upon but treated as an incidental. The purity, goodness and food value of milk, and the deliciousness of milk drinks and desserts should be presented as forcefully and attractively as are the similar attributes of other nationally advertised food products and drinks.

One of the large manufacturers of milk bottles has clearly demonstrated the effectiveness of national advertising (tied up to locally by individual dairymen) in increasing bottled milk sales and in developing a greater interest in bottled milk generally. In 1923 the Thatcher Manufacturing Company inaugurated a campaign of national advertising built around the slogan "A Bottle of Milk is a Bottle of Health." In connection with the national campaign appearing in two national magazines they issued large colored posters to be used by local dairymen on their wagons, in their windows, in windows of stores and restaurants where their milk was sold and served, in schools, office buildings, on billboards and elsewhere. They also encouraged the dairymen to tie up with the campaign by painting the slogan "A Bottle of Milk is a Bottle of Health" on wagons, tank cars, buildings, bill boards and wherever it was possible to display it to advantage.

The tie-up material was not generally adopted and used by the very large dairies in the big cities having their own advertising department, and having a well defined advertising policy already in active operation. But the fairly large and medium size dairy was quick to grasp the opportunity, with the result that in 1925 after the campaign had been in operation only two years, approximately 3,000 dairies made use of posters carrying the nationally advertised slogan.

Dairies using Thatcher's tie-up material reported in 1924 a 19 per cent increase in sales over 1923. And in 1925, they reported a 23 per cent increase over 1924, or a 46 per cent increase over 1923. This represents the average percentage of increase reported by all of the nearly 3,000 dealers using the material.

Putting Bottled Milk on a National Footing.

I cite this case merely to impress the fact that if a fairly modest campaign conducted by a private manufacturer can have this effect upon the sales and business of a small number of American dairymen, a national campaign of large proportions, enthusiastically supported by the milk industry as a whole, would put bottled milk upon a national footing such as it cannot otherwise attain.

In the case of Coca Cola, Postum, Welch's grape juice, Canada Dry, Carnation milk and a host of other nationally advertised products Mrs. Jones in Portland, Maine, and Mrs. Smith in Portland, Ore., are being told on the same day and in the same way why they should use them and where they may obtain them.

From no possible standpoint can the average local advertisements of bottled milk compete with the national advertising of milk competitors appearing in the national magazines circulating in the same locality. Milk must be nationalized through national advertising mediums so that everywhere the public will be urged in the same way to drink and to use it.

There may be certain localities from time to time in which conditions have arisen that have brought about a temporary distrust on the part of the public of the local milk distributing factors, but, generally speaking, the milk industry is highly regarded.

The industry has done nothing that has not been constructive and generally helpful to the public at large. Surely then, if it is to undertake a national campaign its attitude should not be a defensive one.

When more people everywhere are more thoroughly sold on milk and its place in their lives, there will be little room in their minds for suspicion of the industry that makes pure milk possible.

A constructive, offensive campaign, conducted nationally, will enable the milk distributing industry to successfully jump all of its selling and merchandising hurdles.

I repeat, that the milk industry is one of two great American industries that more surely needs national cooperative advertising than any others.

The Practical Sterilization of Milk Bottles by Chemical Disinfection

Results of Experiments in Cleaning Milk Bottles of Vital Interest to Every Man in the Milk Bottling Industry

By MILTON E. PARKER, S. B.*

IT IS the aim of certified milk purveyors and medical milk commissions to have all milk bottles and dairy utensils practically sterile before filling them with milk. In their endeavors to insure the sterility of such packages before use, the American Association of Medical Milk Commissions on June 26, 1923, adopted a set of "Methods and Standards for the Production and Distribution of Certified Milk" in which article No. 14 makes the following provisions for cleaning and sterilizing milk bottles and dairy utensils:

"The dairy building shall be provided with approved apparatus for the cleaning and sterilization of all bottles and utensils used in milk production. All bottles and utensils shall be thoroughly cleaned by hot water and sal soda, or equally pure agent, rinsed until the cleaning water is thoroughly removed, then exposed to live steam or boiling water at least 20 minutes, and then kept inverted until used, in a place free from dust and other contaminating influences."

This autoclaving of milk bottles and dairy utensils makes for a process that is of necessity, intermittent, slow and uneconomical. Furthermore, the life of dairy utensils is materially shortened by the corrosive action of the live steam upon the tin plate of milk cans and pails.

Dry heat is effective. The sterilization of dairy utensils can be readily attained by dry heat without the economic loss due to corrosion caused by steam sterilization. Hot air sterilizers can be kept sealed with the completion of the sterilization process and the contents withdrawn when ready to use, thereby reducing to a minimum subsequent contamination.

"Sterilization of milk bottles by steam insures the destruction of all pathogenic microorganisms." It has been suggested that efficient disinfection might be effectively applied in the stead of steam sterilization. In any event, efficient disinfection would have to mean practical sterilization. Thus the problem of efficient disinfection of milk bottles resolves itself into the possibilities of effective sterilization by chemical means.

There are many chemical disinfectants that are used but because of their corrosive action on metals, or poisonous character, their use is not practical in the automatic cleaning of milk bottles. The compounds such as sodium carbonate and sodium hydroxide or various combinations of these two with or without other cleaning substances are used extensively in the dairy industry for bottle cleaning. Potassium hydroxide is also used. These substances are particularly valuable because of two-fold function they fulfill. Their alkalinity has decided cleaning properties due to the ability to dissolve the casein and saponify the fat of any milk left in the bottles and also has marked disinfecting properties.

Rideal (1) states "The hydroxides of potassium and sodium exercise a sterilizing influence on bacterial growth if they are present in quantities of not less than two to five per cent; so do the carbonates in the preparation of five to ten per cent; the bicarbonates have hardly any action."

Park and Williams (2) state that sodium hydroxide will destroy anthrax spores in 45 minutes when a four per cent solution is used and in 10 minutes when a 30 per cent solution is used. The temperature factor is not given but apparently room temperature is referred to.

Hamilton (3) has found the phenol coefficient of sodium hydroxide is 12.

That the practical sterilization of milk bottles without the use of steam is possible was indicated, by the results obtained in a series of quantitative bacteriological examinations of bottles washed by a Meyer-Dumore bottle cleaner and of bottles washed by the same unit and autoclaved. It was revealed in tests extending over a period of a month that the sanitary conditions of bottles washed by the automatic cleaner alone compared favorably with the bottles washed by the same unit and then autoclaved.

For the purposes of these tests, quart bottles were used, 50 c.c. aliquots of sterile distilled water were added to cleaned bottles shortly after their removal from the washing unit. They were then capped with sterile pulp caps and after proper rinsing, the water was plated in one c.c. portions on duplicate plates of standard nutrient agar. Bottles that had been autoclaved after cleaning were also examined. All plates were incubated at 37 degrees C. for 48 hours.

In this series approximately 250 bottles were tested The average contamination of machine washed bottles was less than one bacterium per c.c.—the actual value being 0.8 bacterium per c.c. The average contamination of machine washed and autoclaved bottles was less than one bacterium per c.c.—the actual value being 0.2 bacterium per c.c.

These results, however, are only indications. They fail to demonstrate whether the method of automatic cleaning as usually practiced is efficient in destroying pathogenic organisms.

A bottle cleaner of three compartment type was used in the tests described and for other later experiments. This unit in practical operation provides for soaking the bottles first in alkali solutions followed by subsequent washings, brushings and rinsings inside and outside of each milk bottle. In their passage through the unit for the cleaning operations, the bottles first pass through two compartments of alkali solution and then through a compartment of fresh water. The temperatures used are 120 degrees F. in the first, 160 degrees F. in the second and 120 degrees F. in the third compartment. In all it takes 14 minutes for the bottles to pass through the three compartments, permitting four minutes exposure in each of the three compartments. The bottles are then brushed, hot water being supplied from one of the tanks and forced to a header and regulated by separate valves from the outside and inside brushes. The bottles then receive a preliminary rinsing followed by two final rinsings inside and out with hot water of about 80 degrees F. The final rinsing and cooling was done with water from a driven well cooling the bottles to about 50 degrees F.

---

* Dairy Technologist, Walker-Gordon Laboratory Co., Plainsboro, N. J. Read before the Laboratory Section of the American Public Health Association at the fifty-fifth annual meeting, October 11-14, 1926, Buffalo, N. Y.

The fact that the soaking operation require four minute exposures at temperatures of 120 degrees F., 160 degrees F. and 120 degrees F. is of pertinent importance.

The Germicidal Efficiency of the Automatic Bottle Cleaner.

Six series of similar experiments were conducted upon bottles washed by the automatic bottle cleaner to ascertain the efficiency of the washing operations.

Quart bottles were contaminated with bovine fecal material and allowed to dry so that in most cases, the inner walls of the bottles were coated with such material that would not rinse off easily. The most instances, particles would stick to the inner surfaces of the bottles and vigorous brushing failed to loosen them. With each series of experiments, 35 bottles were used—30 of which were subjected to the cleaning operations of the automatic bottle washer and the remaining 5 were used for controls.

The cleansed and control bottles were each rinsed thoroughly with 50 c.c. portions of sterile water within an hour after the test bottles were cleaned by the automatic bottle cleaner. One c.c. portions of these rinse waters were plated in duplicate on eosin-methylene blue agar (Difco) and inoculated in duplicate with lactose fermentation tubes. The rinse water from the cleansed bottles was used directly for such purposes while that from the control bottles was diluted in the necessary proportions before plating and inoculating. The eosin-methylene blue agar and the lactose broth fermentation tubes were used so as to facilitate the ready detection of the colon bacilli. The differentiation of any apparent colon bacilli recovered on the eosin-methylene blue agar plates was made by conducting the "Completed Test" for the presence of members of the B. coli group as described in the "Standard Methods for the Examination of Water and Sewage—1920." The plates and fermentation were all incubated for 48 hours at 37 degrees C. Counts were made of the plates and growths and gas formation in the fermentation tubes were noted.

With each series of experiments, the temperatures and alkaline strength of the solutions in the soaking tanks of the bottle cleaner were noted and determined. A record was also kept of the time of exposure to these solutions. All such observations were recorded but space will not permit their reproduction.

The conclusions reached as the result of these experiments are as follows:

1. It was estimated (from the controls) that the contaminated bottles before washing contained more than 600,000,000 microorganisms per quart bottle of which number approximately 200,000,000 were colon bacilli (as determined by the methods described). The other types of microorganisms encountered consisted for the most part of sarcina, streptococci and molds.

2. In all, 190 contaminated bottles were cleansed by the automatic bottle cleaner and tested for the presence of the B. coli group. B. coli was recovered from four bottles. It was found, however, that when the contaminated bottles were exposed for four minute intervals in the solutions of each of the three soaking compartments having caustic strengths of 3.5 and 4. 5 per cent (as NaOH) in the first two compartments and fresh water in the third with temperatures of 120 degrees F., 160 degrees F. and 120 degrees F. respectively, no B. coli were recovered. (See foot-note.) When the concentrations of the detergent solutions were lessened or when the temperatures were decreased in the soaking compartments, it was possible to recover the B. coli in the four instances mentioned.

3. The average number of microorganisms contained in bottles washed under the conditions stated above did not exceed 110 per quart bottle although the initial contamination exceeded 600,000,000 microorganisms per bottle. The average number of microorganisms contained in bottles washed under the same conditions but subsequently autoclaved and stored before use did not exceed 65 per quart bottle. The types of organisms found in the cleansed bottles consisted of sarcina, hay bacilli and other types common to the atmosphere.

Another series of experiments was conducted to study the effect of various alkaline solutions upon B. coli. The alkaline solutions studied consisted of various concentrations of sodium hydroxide and sodium carbonate used separately and mixed together. A bovine strain of B. coli was employed as the test organism.

Five-tenths c.c. of 24-hour broth cultures of test organism was placed into solutions consisting of varying amounts of the alkalies so that the mixtures contained amounts ranging from one to six per cent by weight of the chemicals. Control tubes of sterile water were also inoculated with 0.5 c.c. of the 24-hour broth culture so as to study the effect of the heat agency alone. At intervals of two minutes, loopfuls of the mixtures were inoculated into 10 c.c. tubes of nutrient broth. The temperatures used were 72 degrees F., 100 degreee F. and 125 degrees F. The inoculated tubes were incubated at 25 degrees C. for 24 hours.

The results are shown in Table 1.

Table 1—A. The Effect of the Concentrations of Sodium Hydroxide and Sodium Carbonate at Various Temperatures Upon the Viability of B. coli.

20 Mins.		X						

(X) = growth (—) = no growth

FOOT-NOTE—During the operation of the automatic bottle cleaner, there was a certain amount of mechanical transfer (carry-over) of alkalinity from one soaking compartment into another. Because of this fact, it was found necessary to provide caustic strengths of 4 and 4.5 per cent (as NaOH) in the first two soaking compartments in order to maintain the proper concentrations of detergent during washing of approximately 15,000 milk bottles of different volumes.

OAKLAND

IS READY FOR HER VISITORS

Pacific Slope Dairy Show to be held in Western City, November 13th to 20th Inclusive. You Are Cordially Invited.

By ROBERT E. JONES, *Secretary-Manager, Pacific Slope Dairy Show Association*

PLANS are maturing fast for the big Pacific Slope Dairy Show in Oakland, Calif., next month. An exceptionally strong program has been prepared and the entertainment features are being worked out in great detail, and in addition to the health and educational features, will include special programs nightly.

Robert Condee, president of the State Fair Board, and director of the George Junior Republic, is putting in much time and effort on the cattle show of the Oakland event. The George Junior Republic carried off some of the ribbons at both Pomona and Riverside and will have some fine entries of the dairy type at Oakland.

"The Pacific Slope Dairy Show," according to Mr. Condee, "is doing a remarkable work in bringing to the attention of the people who use the products of the dairy, what a great industry it is and how important it is to everyone, not only from a business standpoint but also from a health standpoint. The show is being well staged and visitors will certainly have an opportunity to see the best cattle on the Pacific Coast."

Milk dealers will be particularly interested in the dairy products exhibit.

The premium list for products classes this year contains some provisions designed to make this competition of more value. Superintendent G. D. Turnbow of the Dairy Products Division has established a gold medal class for Classes 15 and 16—Grade A Milk, Pasteurized and Grade A Milk, Raw. This new idea in milk scoring has been approved, so that instead of there being only one gold medal prize obtainable, any milk dealer who can attain a score of 97.5 per cent will be in the gold medal class and obtain such a prize from the show.

This score is pretty high, but it was decided upon only after a careful study of scores attained in the five Pacific Slope shows that have gone before. Several exhibitors have reached the gold medal class in the past.

DE LAVAL

DE LAVAL

DE LAVAL

100% Profit with a New Series De Laval

IF a New Series De Laval Separator of the size suited to the needs of your plant saves 1/100 of one per cent butter-fat it will pay for itself in a year or less and after that earn 100 per cent profit for years to come.

Many New Series De Lavals are doing better than this.

Operators report standard Babcock tests showing a scant 1/100 of one per cent fat when running relatively cool milk. Others running warm milk report fat losses so small that it is impossible to obtain a reading, a mere trace of fat appearing in the tube.

The New Series De Laval produces very heavy cream with less loss of butter-fat than was ever before possible and is particularly efficient in re-skimming gathered cream.

The New Series bowl is constructed so that unless it is subjected to exceptionally rough handling it should stay in balance over a long period of time. Hence, wear on the entire machine is reduced and assurance is given that the original skimming efficiency will be fully maintained for many years.

Write for full details regarding the capacity and style of drive suited for your plant.

What a Laboratory Did for One Milk Company

Great Improvement in Quality of Milk Brought About Through Keeping Check on Bacteria Counts, Followed Up by Personal Visits to Farms of Offending Farmers

By H. MACY*

A CONCRETE example of the effective improvement in the quality of the milk supply of a milk distributing plant through the agency of a laboratory is offered in the material presented here.

Each summer the dairy division of the University of Minnesota makes an effort to place students specializing in dairy manufacturing, in representative dairy establishments for practical experience to supplement their collegiate studies. An opportunity presented itself in 1923 to locate a student with one of the milk companies in the Twin Cities as bacteriologist for the summer months. The company was so well satisfied with the results that the same arrangement has been continued since that time The work was done in co-operation with the University, under the supervision of the writer. The company had theretofore not employed a regular laboratory technician and had not felt in a position to engage one for the entire year. As a result of the temporary arrangement this company now, however, feels inclined to establish a full-time laboratory in light of the valuable data obtained during these past three summers.

One of the first steps considered in 1923 when this work was instituted was a survey of the quality of the raw milk delivered at the plant for pasteurization. During the summer samples were taken at intervals from individual patrons. These samples were examined by the Breed microscopic method.

In order to facilitate the work and to give a basis for comparison, arbitrary standards were chosen. It was decided to use a ratio of 4:1 as representing the relationship of the microscopic count to the standard plate count. The grades established were:

V. S.—**Very Satisfactory**—microscopic count of less than 1,000,000 per c.c.

S.—Satisfactory—microscopic count of more than 1,000,000 but less than 8,000,000 per c.c. (This milk was considered satisfactory for pasteurization under local regulations.)

U.—Unsatisfactory—microscopic count of more than 8,000,000 per c.c.

With the microscope standardized and the number of bacteria per field necessary to throw the sample into one of the three grades easily determined, the observations were simplified, facilitated and offered substantially useful information.

During the two and one-half months of the summer, late June, July, August and early September, the results for the three years, expressed in the percentage falling in the three grades were as follows:

Microscopic Counts on Raw Milk for Pasteurization.

Year	Per cent V. S.	Per cent S.	Total per cent satisfactory for pasteurization	Per cent unsatisfactory
1923	31.44	32.45	63.99	36.10
1924	42.01	35.44	77.45	22.55
1925	50.99	37.54	88.53	11.47

This shows a very remarkable improvement each year in the quality of the raw milk from a bacteriological standpoint. By means of this laboratory analysis and survey, it was possible to locate the poorer grades and the producers responsible for them. Visits were then made to the farms of these patrons with the results illustrated in the improvement in each of two succeeding years. This company was indeed accomplishing a splendid thing both for the public and for itself, and entirely of its own initiative. Such an activity would be a credit to any control agency, municipal or otherwise, and inasmuch as the effort was a voluntary contribution of a private concern, it is much more commendable.

Plate counts of the raw milk were also made from time to time. The averages for the three years are given below:

Year	Average Count
1923	14,200,000
1924	6,700,000
1925	2,700,000

These high average plate counts may be explained by a few high individual samples. The following table showing the distribution of the samples indicates this more clearly:

Count per C.C.	Per cent of Samples 1923	1924	1925
Less than 1,000,000	0	13.3	40.0
1,100,000 - 2,000,000	22.2	20.0	5.0
2,100,000 - 5,000,000	11.1	6.6	25.0
5,100,000 - 40,000,000	66.7	46.7	15.0

Most of these plate counts were made from raw milk samples taken from storage tanks, some of which contained milk held overnight.

Plate counts made upon the pasteurized bottled milk also demonstrated clearly the gradual improvement in results for each successive year. This is brought forth in the following table:

Year	Average Plate Count
1923	67,000
1924	30,000
1925	15,800

When these counts are arranged on the basis of percentage distribution in groups we observe the following:

Counts	Per cent of Samples 1923	1924	1925
Over 50,000	41.8	9.6	5.0
25,000 - 49,000	25.0	32.3	15.0
10,000 - 49,900	16.6	58.1	30.0
Below 10,000	16.6	0.0	50.0

As the information became available upon the efficiency of pasteurization and plant operations, it was possible to improve upon the methods with the consequent lowering of the count in the finished product.

A regular check was made also upon the general efficiency of plant operation from the standpoint of bacterial counts.

In a comparison of the counts before and after clarification it was found that in 39.5 per cent of the cases clarification resulted in an increase in count, 58.1 per cent showed a decrease and 2.4 per cent no change. These results are typical of the effect of clarification on the bacterial count.

The data on the effect of the horizontal filter indicate that about 50 per cent of the samples increased in count

CAN DRAINER AND DRIP SAVER

You can save the rich milk that too often drains into can washers by using this Faultless Can Drainer along the line of dump.

As the cans are dumped they are placed bottom up on this Can Drainer and pushed along by the next—and so on—giving ample time for draining and yet not slowing up the dumping operation at the receiving door.

You will be surprised at the rich milk this Can Drainer will recover.

Built of sturdy material to stand a lot of wear. Easily cleaned. Reasonably priced.

OUR CIRCULAR GIVES FULL DETAILS. SEND FOR IT.

Some Facts About Advertising

Of Interest to the Dealer Who Handles His Own Advertising Campaigns. There are Many Combinations Possible in Dealing With Those Twenty-six Letters of the Alphabet

By JOHN T. BARTLETT

THE obtrusive fact about words in newspaper advertising is the small number of them. Hundreds of thousands of advertisements are published with less than 40 words.

Except in the large space units, 75 words is unusual, while advertisements running to 150 words are comparatively rare. Even in quarter pages and larger, 200, 300 and 400 words are the usual limits.

Compare these numbers with words in other literary forms. It is a short business letter which does not contain 75 words, and many business letters contain 700 or 800 or more. Many articles in business magazines reach 1,500 words. The standard short story length for numerous fiction publications is approximately 5,000 words, with stories frequently going to 7,000 and 8,000 or more.

Why is it that advertising uses far fewer words than informational and light literature? It is not, fundamentally, because of the space used, because it is quite feasible to put as many times as many words into advertisements than now, on the average, are used. The reason is one of expediency—and regard for effectiveness.

There is no magic in small number of words. The salesman who limits himself to 25, or 50, or 100 words when interviewing a prospect would be properly considered a subject for psychopathic observation. An advertiser can do, ordinarily, much more with 200 words than with 100 words—provided readers will listen to the entire 200 with interest. The trouble is they won't do the latter, in most cases.

The advertising world takes the view it is far better to use few words, and get them read, than print many which tire the reader and are abandoned before the story is half told. So advertising writers resign themselves to the task of taking very few words, and making them individually and as a group work with astonishing success.

How Long Does it Take to Write an Advertisement?

How long does it take to write a good advertisement?

An amateur advertising writer—in the sense that he writes only for his own business—replied to our favorable comment on a 75-word advertisement, "Yes, it ought to be! I sweat for three hours over that!"

Another business man who writes sales letters, incidentally, only one of many store duties, told us he had "worked for two days" to produce the splendid letter we complimented him on. He had a dictionary at his elbow, he related, and he kept at the letter until he was satisfied with it. It contained six paragraphs, and approximately 250 words.

On the other hand, a professional advertising man, conducting a service agency in a small way, was observed turning out advertisements for clients at the rate of eight or ten an hour. Most of the advertisements were not ones to win compliments.

We have seen unusually good sales letters, of from 400 to 500 words, turned out in less than an hour—all ready for the wrapper. The letter writer, however, was not writing about a strange subject, but one he had written on many times before. Moreover, before he started, the basic letter idea had been decided on.

Department store advertising managers in many cases turn out a page advertisement daily, and more or less direct mail advertising matter and perhaps billboard copy. The department store manager, however, usually has assistance. A great deal of copy comes to him which he can use with very little attention to it. Of course, after getting out many hundreds of large advertisements, the department store advertising man "gets the habit." He can turn out copy fast.

A professional advertising man, known far and wide for the literary excellence of his copy, dictates to his secretary who writes it in longhand. He may spend two hours over 200 words of text—and come back another day to spend another hour on it. This man is an exception.

There is no question that advertising writers of much experience can turn out good copy far more rapidly than can an advertiser who writes only his own advertising, and not much of that. Practice and experience do produce facility.

Nevertheless, we seldom hear a veteran copy writer contend that he can produce better stuff in fast time than when given an ample margin in which to produce and put on the finishing touches. Speed in writing advertising copy is not a goal to aim for, and the beginning advertising writer, in particular, should realize that fast copy writing is full of perils. A great many beginning advertisers, writing their own copy, could produce far better messages were they willing to put in, where necessary, three hours on a 75-word advertisement.

⁂

TERRE HAUTE BUSINESS PROSPEROUS.

Facts and figures concerning the business of the Terre Haute Pure Milk and Ice Cream Co., Terre Haute, Ind., prove interesting as related in a recent article in the Terre Haute Post, which points out that the company was established in 1909 and has enjoyed a continuous growth in its business of manufacturing a complete line of dairy products. The principal products include pasteurized cream, milk, cottage cheese, ice cream and creamery butter.

Henry Ward, who became connected with the organization in 1910, is given much of the credit for the company's rapid development.

The plant, which is located on N. Fifth St., is one of the most modern and sanitary in the state and the latest type of machinery and equipment has been installed.

The company has a number of routes for both retail and wholesale distribution.

3,000 Gallons Daily.

The volume of the Terre Haute Pure Milk and Ice Cream Company is shown by the fact that it bottles approximately 3,000 gallons of milk and manufactures 1,000 gallons of ice cream and 1,500 pounds of butter each day.

Officers of the concern are: George D. Foulkes, president; Henry Meyer, vice-president; Frank C. Fisbeck, treasurer, and Harry Ward, secretary and general manager. The board of directors includes the officers and Charles Fox, E. T. Hazeldine, Clair Dobbs and Prof. E. W. Kemp.

Cottage Cheese Surprises Many

The West Coast is Convincing the Public that Cottage Cheese is Really Good

By M. O. MAUGHAN*

THERE are a good many men engaged in the dairy industry who still feel that cottage cheese is a "drug on the market" and is difficult to "put across."

A good many people feel that the public cannot be persuaded to eat cottage cheese to any great extent and that its future is limited.

For a long time I was guilty of the same idea myself and it was not, in fact, until I visited the West coast during the past summer and saw the way the people ate cottage cheese there, and also the improved manner in which it was made, that I became thoroughly convinced that cottage cheese surely has a great future.

In practically all the entire states of California, Oregon and Washington, an unusually high grade of cottage cheese is being made—cheese in large flakes rather than in small crumbles and having a most pleasing flavor. For the first time in my life, I ate cottage cheese that left that "I want more" taste.

From San Diego on the south to Seattle and Spokane on the north, the majority of milk dealers are recognizing a great source of profit in cottage cheese. For example, our good friend and former president of the International Association of Milk Dealers, Fred B. Martin of Spokane, is making such good cottage cheese that he has a demand for it hundreds of miles away. He now makes regular shipments to Yellowstone Park, to Colorado Springs, Colo., and other places equally far distant, Colorado Springs being somewhere between 1,500 and 2,000 miles away by rail.

One can go into almost any cafeteria in the West and find cottage cheese very prominently displayed in dozens of different and appealing combinations, and it finds its way onto the tray of the business man, and the stenographer, and all others, to an amazing extent.

In one cafeteria in Seattle I found exactly 57 people out of 100 whom I counted took cottage cheese in some form or other.

In California the consumption of cottage cheese in 1925 was 2.54 pounds per person against approximately one pound average for the United States.

In St. Louis, creamed cottage cheese, made by homogenizing cottage cheese and cream, has become wonderfully popular and decidedly profitable. One milk dealer there found it could be used in 76 different ways —all wonderfully good. It is truly surprising the assortment of delicious dishes that can be made with cottage cheese as the basis. A few of them include:

Tomatoes stuffed with cottage cheese.
Celery stalks filled with pimento, olive and cottage cheese.
Prunes stuffed with cottage cheese.
Shredded cabbage and apple with cottage cheese.
Cubed pickled beets with cottage cheese.
Cottage cheese and pineapple.
Cottage cheese and nuts.
Cottage cheese plain.
Cottage cheese and tart jelly.
Cheese balls rolled in chopped parsley or nuts.
Cottage cheese sprinkled with paprika.

I am now convinced that there is a much greater opportunity ahead for cottage cheese than the average man in the dairy industry believes. Seeing is believing. There are some concerns that have patented processes on cottage cheese, and which charge a royalty for their particular process, and there are others which are glad to give information free of charge to their fellow milk dealers especially in adjoining cities as to how it is made.

With the opportunity ahead for a greater consumption of cottage cheese, there is no reason why skim milk should be poured down the sewer as it now is in so many different places.

One of the big jobs ahead of the dairy industry is to broaden the uses of dairy products—real good cottage cheese is one of the solutions to this problem.

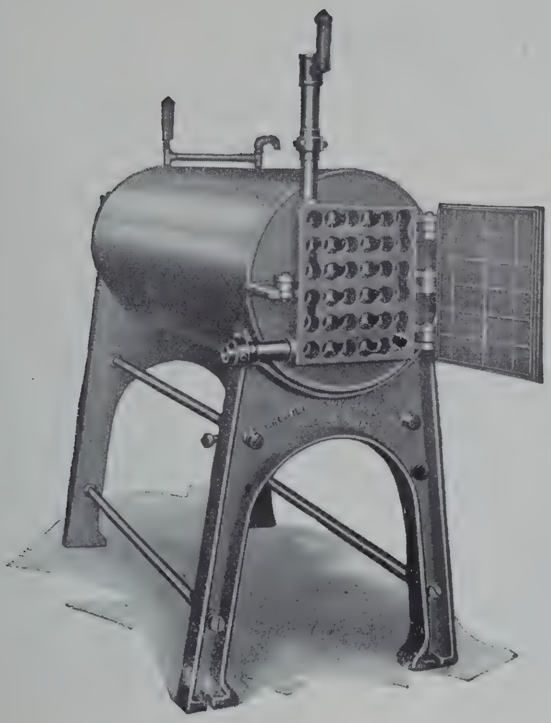
---

* Secretary of the National Dairy Council.

⁂

MILK BOTTLES TO BE STANDARDIZED.

Milk bottles are going to be reduced to four standard sizes, the simplified practices divisions of the department of commerce announced recently. There will be two quart sizes, nine and one-half and nine and one-quarter inches high; one pint and one-half pint size. Three years ago milkmen were using more than a dozen different sizes of bottles.



Breyer Ice Cream Company
Philadelphia, Pa.

USE TWO CHESTER BARREL HEATERS

One at the Philadelphia Milk Plant

They use a regenerative surface cooler and compartment type holders with a Chester Barrel Heater between these two. It is important in this instance that the heating temperature be accurately maintained and controlled. This is accomplished in a very practical and satisfactory manner with a Chester Barrel Heater.

One at the Millerstown Condensery

Here all Milk passing to the hot wells is first sent through a Chester Barrel Heater and heated to the desired temperature. This eliminates condensing live steam into the milk in the hot wells. It effects a saving of time and also the enormous cost of recondensing the water out of the milk.

The CHESTER BARREL HEATER is used to solve all sorts of heating problems in the dairy industry. What is yours?

Why This Trend Toward Sheet Metal In Building Construction?

A Material That is Economical to Use and Thoroughly Adaptable to Factory Building Requirements

By B. B. POPELL*

SHEET steel is a material so familiar in countless forms and uses that its every day service is taken for granted. Yet, without it, modern industry commerce, transportation, agriculture and the home life of today would be greatly handicapped, and many conveniences greatly increased in cost.

Sheet steel is the material of universal adaptability. It enters into the construction of the Brooklyn bridge and the spectacle case in your pocket, the Woolworth building and your waste basket, the Eiffel Tower and your alarm clock. It is used alike in the Rolls-Royce and the Ford, in the Twentieth Century Limited and the youngster's toy train, in the Leviathan and the row boat. From battleships to electric irons, from corn cribs to bedroom furniture, from great railway terminals to portable garages, things of many kinds and uses are made safe, convenient, sanitary, efficient and durable by sheet steel.

It is only within the last two decades that the world has learned of the advantages of this modern material—of the unusual efficiency and economies it affords. In 1905, American mills produced less than one million tons of steel sheets. By January, 1924, the annual productive capacity had increased to nearly five million tons. Yet this 500 per cent increase in the use of sheet steel, large as it is, represents only a small part of its potential usefulness and service to every industry.

Here is what the leading editorial in Collier's Weekly, March 27, 1926, says: "Our modern world has grown around a steel skeleton. Back of everything we do lies the steel backbone. The houses we live in and work in; the conveyances that take us to work; our tools of employment and our toys of pleasure are all dependent on steel. It is as essential to our present day life as air, water and fire."

Material, like individuals, must "show the goods" if it is to make good. This tremendous increase in the use of sheet steel would indicate that it does just that, else why its ready acceptance wherever its advantages are known? Among the first to prove the desirability of this material were the railroads, the automotive industry and the electrical world, still among its largest users. These great organizations, ever on the lookout for better materials, improved methods, lower first costs and reduced maintenance expense, have found sheet steel, the answer to their every requirement.

Let us take up the advantages of sheet steel. They will serve to explain the ever increasing trend toward sheet steel construction.

At present America is confronted with a tremendous fire problem. Our annual losses from blazes—most of them avoidable—are staggering, showing a steady increase from year to year. Last year, for example, this nation literally threw into the fire-heap $570,225,921, an increase over the highest previous figure of $21,193,797!

Some Uses for Sheet Steel.

Sheet steel construction offers one hobby to this nation-wide problem because it is absolutely fire-resistive. You take no chances when you use it—and you insure double protection from destructive flames. First, adjoining buildings that are afire cannot ignite steel-clad structures. Burning embers fall harmlessly on the steel sheets and smolder until they die. Sparks from bonfires and chimneys are harmless, like water on a duck's back. For instance, in the recent $1,000,000 fire that took place in the yards of the Harris Brothers' Company in Chicago, an all-steel garage alone remained standing amidst the mass of ruins.

Another fire service that sheet steel offers is that it confines that start from combustibles within the building, and keeps the flames from spreading to adjoining property. A short time ago some paper stock caught fire in the Robert Goir Paper Plant at Piermont, N. Y. Firemen fought the flames for four days before they extinguished them. But this all steel building successfully confined the fire all that time. It did not spread.

Also, sheet steel is usually durable—it lasts a lifetime. The forces that undermine other materials have no effect on it.

Then, too, properly grounded sheet steel buildings offer absolute protection against lightning. They lessen the danger of stroke and render it harmless should it come. The late Dr. C. P Steinmetz, chief consulting engineer o the General Electric Company, and recognized authority on lightning stated that steel structures properl grounded offer the only form of habi tation that is absolutely lightning proof.

Then, too, properly grounded shee ideal structure must be able to stand the various natura elements—heat, cold, rain, snow and wind. Sheet stee construction offers a permanent defense against atmos phere. There is no warping, no shrinking, no cracking no rotting away.

The old myth that material which is tough and dur able cannot be pleasing to the eye, too, is no more. Shee steel gives attractive appearance without a sacrifice of other desirable qualities. And its beauty endures through the years.

---

* With Sheet Steel Trade Extension Committee, Chicago, Ill.

Sheet steel makes possible a two-fold economy. First, in low first cost. Sheet steel buildings cost at least no more, if not less, than other types. Second, there is further savings in reduced upkeep. "It's not the cost, it's the upkeep," says a popular maxim. With sheet steel further expense is eliminated. The first cost is practically the last.

Rat and vermin proof. Products stored in sheet steel buildings are safe against destruction by pests of any kind. Steel offers a positive barrier to rodents who can gnaw their way through almost every other material.

A Creamery in Steele County, Minnesota.

Today, the steel building serves as a storeroom, a warehouse or a factory. Tomorrow, if your needs demand, it may be converted to any other use. This advantage is all important in these days of changing needs and over-night developments.

"The proof of the pudding is in the eating." Trite, yes, but isn't it true? And proof of all these merits abounds everywhere. Were not sheet metal practical, enduring, efficient and economical it would not be the choice in production, in transportation and in every type of building today.

This is an age of steel. Other materials are being tagged out of date, one by one. It's a logical evolution. and when science develops a better material than sheet steel, that material will succeed it in building. Until then sheet steel will continue to give dollar for dollar value to builders everywhere.

⁂

VISITORS ARE INVITED.

All modern equipment and machinery necessary for the operation of a milk plant in the most expeditious and sanitary method is in use by the Shelly Dairy of Lima, O., according to Roy Etherols, manager.

The employees of the plant are only required to operate the machinery, the product never being touched by human hands.

Officials of the company have extended an invitation to the public to visit the clean, wholesome plant at 412 S. Jackson St. It is felt certain that a visit through the plant will convince the most discriminating person that the modern methods of handling milk are designed to protect the health of all users of this staple food.

⁂

You cannot afford to miss a single copy of "The Milk Dealer." If you have not done so, be sure to send in your renewal today.

NEW JERSEY HEALTH OFFICIALS RE-EXAMINE SCHOOL MILK SUPPLIES.

Public school milk supplies were re-examined by the bureau of food and drugs of the New Jersey Department of Health and showed a marked improvement in sanitary condition over the milk supplies at the time of the first examinations. In the reinspection, 111 schools were visited and inquiries made in regard to the source of the milk supply, whether raw or pasteurized, whether statements on the bottle caps were correct, the amount of milk distributed to the pupils, and the method of handling it at the schools. The total amount of milk handled in the schools visited was 2,684 quarts daily. Almost 90 per cent of the schools distribute milk to the children in half-pint bottles, a straw being furnished with each bottle. In the remainder of the schools the milk is either poured from the original container into glasses or mugs or used in the preparation of hot cocoa. At 88 of the schools pasteurized milk is used; at 17 schools raw milk from cows that have successfully passed a tuberculin test within one year is used; and six schools use raw milk not produced by tuberculin tested cows.

At each school visited, samples of milk were taken for chemical analysis. Of the total 227 samples collected and examined, the average total solids content of the milk was 12.2 per cent and the average fat content 3.5 per cent. Twenty-one samples, or 9.2 per cent, were found to be below the state standard in total solids or butterfat. The percentage of samples below the standard this year is much less than last year when the percentage of low-standard milk was 17 per cent. This shows greater interest on the part of the school authorities as well as increased effort on the part of milk dealers to furnish a satisfactory supply. In eight schools visited, the caps used on bottles of pasteurized milk did not comply with our regulations; and in one case an ordinary raw milk was falsely labeled "pasteurized."

Whenever any unsatisfactory conditions were found in connection with a school milk supply, the facts were communicated to the proper school official and such action recommended as seemed necessary to correct the fault. Follow-up work invariably showed correction of faulty methods and improvement in the supply.

In general these school investigations have had the hearty co-operation and endorsement of school principals and others interested in furnishing clean, safe milk to the children. Local boards of health in several municipalities have been sufficiently interested in this work to collect samples from their schools regularly. The bureau will continue the work during the coming year and the milk supply of each school in the state will be investigated.—From Annual Report by the Department.

⁂

CLAIM RAW MILK CAUSED EPIDEMIC.

Citizens of Cambridge are fortunate in having an adequate supply of pasteurized milk, considering that an epidemic of typhoid fever, the origin of which is said to have been traced to the use of raw milk, is prevalent in the village of Wellington, O.

An article in a Wellington newspaper recently disclosed that 97 actual or suspected cases of typhoid fever were reported in the village, which has a population of 2,000 persons. Cases have also been reported in several cities and villages near Wellington.

The advisability of using only pasteurized milk has been emphasized by physicians in the vicinity of Wellington. A similar condition exists in Ashtabula it is said and existed in Sandusky one year ago.—Cambridge, O., Jeffersonian.

Yes—Some Dairies Do Fail

And There's a Good Reason, as You Will Find Upon Reading This Story of Men Who Tried to do Business Without Business

THERE was plenty of business—worlds of it. In fact, no competition. It was the only pasteurized dairy of its city. The city was proud of it, and it was a nice city, a nice, progressive, up-and-coming, go-and-get-'em city with plenty of boosters and a number of live civic organizations. There were prominent citizens behind the venture, the best in the city, and they had no hesitancy in putting up plenty of capital.

Yet the dairy failed.

Yes, it failed—failed dismally, flatly. It went up with a loud report, and after the echoes died away several officials were found sitting in a dingy, shadowy office rubbing their heads in a dazed manner and trying to figure out just what happened. They would put you in mind of a certain little man in Holland who now wanders around in the woods with a saw in his hand and a far-away look in his eyes and trying to realize that there no longer is an emperor of Germany.

The business failed. The dairy went up; the pasteurized plant was a hazy dream.

How did it happen? Few people can tell you. They shake their heads in this city and say it is all a mystery. Certainly there was plenty of business. All are agreed upon that point. They saw the pretty little creamy white dairy wagons scooting over the streets of the city with a business-like air.

The drivers were cheerful and full of pep—on their toes all the time. They were good at collections—very good. In fact, it was the sort of town where collections are good in every line of business. The city took pride in this fact.

Everybody, in fact, took pride in this nice, up-to-date dairy plant; they emphasized the fact it was a pasteurized plant.

This plant failed because of too much business—too much business, that is, without any real, practical business methods. There were too many cooks handling the books. They were all good bookkeepers. The statement in bankruptcy proves that to a T. You should have seen that statement! Nobody but a bookkeeping genius could have so worked out those figures in a way that you could tell everything about the business—except what you wanted to know. Those figures made the Gordian knot look like a child's tangled string.

The bookkeeper's statement in the bankruptcy petition answer is fairly indicative of the kind of bookkeeping that spelled disaster for this firm.

Here's how it happened:

The drivers went out every day on their routes, went out singing and happy. They came back the same way every day, all of them cheerful and making optimistic reports.

Now, Frank Jones, for instance, came in to report one day. They liked Frank at the dairy; he was a cracker-jack, they'd tell you, at digging up new customers and increasing orders from old ones. He was good and knew it!

"Er—now, just how many cases did you take away this morning, Frank?" the route foreman would ask, a far away look in his eyes. "I believe it was twelve, wasn't it?"

"Six," Frank would correct him quickly. "Just had six this morning; you know you decided to send the other six out on route 3."

"Ah, guess you're right about it. Six, eh?" Well, now Frank, I believe that makes you owe us so many dollars and so many cents."

"A little bit less than that," Frank would reply; "you know I didn't get quite all of my salary last week; collections weren't quite enough. Anyhow, Mrs. Wilson said she'd mail you in a check for hers. You got that check, didn't you."

"Er, I believe I did hear something about that check coming in, Frank. Guess that's all right."

You see, this extraordinary dairy had followed the practice—the very bad practice!—of letting its drivers collect money and keep out some of it on their salary. Furthermore, they had followed the practice of upholding no practice in checking drivers in and out. They never knew where they stood. They possibly earned enough money to pay handsome dividends, but no dividend ever was paid—not one.

The extraordinary bookkeepers, befuddled by this weird practice, trying to cover up some of the figures that looked doubtful, soon got the books in such a shape that you could look them all over at a glance and be sure of yourself absolutely—be sure, that is, that you didn't know anything about them.

Yes, everybody was cheerful—quite cheerful all the time. It looked like somebody was making money—and somebody was! That was the best killing those drivers ever—ever had. There were more milk drivers owning nice automobiles in that city than you would find anywhere else in the world. A lot of prominent citizens paid for them.

This plant is going to come back. The prominent citizens are going to see to that. But next time they go into the milk business they are going to be sure they are going into business. Sure, they are going to get some good cracker-jack, practically trained dairymen to run the plant. They'd be foolish not to do so. They had such men before. But these men, well trained in the business of handling milk, were babes in the woods when it came to business—real business.

The prominent citizens are going to put this plant on its feet, reorganize, put practical dairymen in charge, and see that practical, methodical men keep track of all the milk that goes out and comes in. Also they will keep track of the money—and they won't do any guessing.

Yes, some dairies do fail.

Many people wonder why.

NORTH DAKOTA PLANT ENLARGED.

Improvements to cost in the neighborhood of $10,000 are being made to the building occupied by the Acme Dairy Co., 701 Thirteenth St., Fargo, N. D. Remodeling of the plant and construction of an addition will double the present capacity of the plant, according to Frank P. Peterson, manager.

The present building, which is 16 by 47 feet, will be enlarged to 32 by 52½ feet, he said, and will be equipped with all modern machinery. The building will be a one story cement structure and will be stuccoed on the outside.

NATOMA-HUNTLEY DAIRY CO.
DAIRY

Present Day Profit From Present Day Methods

1250 gallons of milk, the "best of food," for Chicago folks! And this is only one of the Natoma-Huntley milk trains that travel for miles and miles in the country around collecting milk for the Natoma-Huntley Creamery.

A 6-ton load—a 3½-ton truck. In other words, 2½ additional tons of milk hauled for the cost of the extra gasoline and oil needed to pull the Trailer. Figure also the investment cost of this train in comparison with that of motor trucks sufficient to carry the load. From every angle the savings brought by Trailers are tremendous. And, the profits are naturally in proportion.

These are the advantages that Fruehauf Trailers are bringing to milk dealers wherever they are used. These are advantages which no business man can do without. Fruehauf Trailers have a place in your organization as surely as the most important man you employ.

It is a case of save more money—make more money, in the milk business just as in any other. Here is a way to wholesale savings. Let us tell you about some other creameries using Fruehaufs and the benefits Fruehauf Trailers are bringing them.

Pioneer Builders of Semi-Trailers, Four-Wheel Trailers and Adjustable Pole Trailers.

Buttermilk and Business

As a Nutritious Food and as a Business Builder Buttermilk Stands Preeminent

By A. D. BURKE*

THERE should be no "closed season" on commercial buttermilk. Yet the idea seems to prevail that the product is purely a good old summer time drink and just another means of getting rid of the surplus.

That may be true but I fail to see any reason why buttermilk should not be made an all-year beverage with well sustained seasonal sales.

Perhaps our advertising is at fault. Possibly we fail to deliver the right type of consumer appeal and I am inclined to believe that herein lies our difficulty.

Some time ago Metchnikoff discovered that Bulgarians lived to a "ripe old age." This he attributed to the consumption of large quantities of sour milk. The information spread and Bulgarian buttermilk became popular.

Scarcely a day passes that a request is not received at our college commercial creamery for a bottle of Bulgarian buttermilk and a flat refusal to drink commercial buttermilk, that "cultured stuff," on the grounds of the artificial means of its manufacture.

Evidently someone read the Prolongation of Life by Metchnikoff, wrote a popular article and sold the public on Bulgarian buttermilk. That such may have been the case is brought out in an article by Mr. Frommes published in The Milk Dealer of last December in which he writes as follows:

"A newspaper with 900,000 subscribers in Greater New York published an editorial on the fact that Bulgarian peasants live to be 100 more often than the people of any other land because for generations they have almost lived on buttermilk. Following this there was a stampede for the buttermilk stands and New York soda fountains sold out their gallons of buttermilk before noon each day."

We publish articles among ourselves, we read bulletins; study scientific discussions and researches but do we actually reach the public to tell the value of the product?

"Have you had your iron today?" sells raisins. The word "vitamine" apparently sells yeast. The other day I was walking with a friend who suddenly complained about his stomach being "all upset" but that if he could just secure a cake of yeast he would be "all OK." The more he thought about it the more he complained and the more he wanted the yeast. Finally he stopped in a drug store, secured his "vitamines" and with alternate bites of yeast and sups of water disposed of the product. Whether he liked it or not mattered little. It apparently served its purpose as he shortly declared much improvement in his condition. He will continue to use yeast. His lesson had been learned through commonplace advertising that all could understand. Why not try it on commercial buttermilk? Instead of publishing all our information in scientific journals let us publish an occasional article in newspapers and popular magazines.

There are plenty of facts to substantiate both the food and therapeutic value of the product. The U. S. Department of Agriculture has declared it "a pleasant refreshing beverage and a nourishing food combined in one product." It further states "that prepared buttermilk is usually made from skim milk and has all the chemical properties of buttermilk. If it is is churned, as is usually the case, it agrees in appearance and flavor with real buttermilk. In fact it is often a **better product** especially if clean, sweet skim milk is used and it is carefully ripened and churned."

We have proof of the successful use of both Bulgarian and commercial buttermilk in the treatment of certain infant ills and in difficult feeding cases.

Its value in correcting intestinal disorders in adults has been demonstrated while its employment as a sole food in typhoid cases is known.

In addition Fisher and Heinemann have demonstrated a germicidal effect of lactic acid on certain pathogenic bacteria and while as Fisher concludes "the results of other experiments seem to indicate that this germicidal action of lactic acid does not extend to the control of organisms already in the intestine" it does prove as Fisher further states "that lactic acid has decided germicidal properties and may prevent the infection of fermented milk with harmful organisms." Although Fisher's work dealt chiefly with a study of Bulgarian buttermilk rather than the lactic commercial product the effect of acid on undesirable bacteria is worthy of note and signifies another possible valuable attribute of cultured buttermilk, since as we all know the lactic acid in both products varies only in amount and not in chemical composition.

Certainly as a business builder, a nutritious food, and a palatable product, buttermilk stands preeminent and yet in 15 plants in New England according to recent government survey the amount of cultured buttermilk handled was but 1.2 per cent as great as the amount of milk and cream used, whereas in 13 plants in the east south central states the ratio ran as high as 27 per cent. Undoubtedly we have an open field in the buttermilk business. Perhaps we are failing to blow our own horn.

⁂

NEW OHIO PLANT.

A wholesale and retail milk and ice cream manufacturing plant will be erected by the Leichner & Jordan Co., Portsmouth, O., according to recent account. The company has been operating an ice manufacturing plant in Portsmouth for some time and the new plant will be built adjacent to its present ice plant.

The company already has machinery ordered for the handling of milk and the manufacture of a complete line of milk products, including the making of ice cream on a large scale. The machinery will be of the latest and modern type for the complete pasteurization of milk.

W. O. Moore, who has had years of experience with other local milk and ice cream industries, has been engaged as manager of the new plant, which is expected to begin operations within 90 days.

U. S. Gutta Percha Paint Co.
Providence, R. I.

Gentlemen:

It is an easy thing to look up the address of a manufacturer and to then write him a hot letter of complaint when some cog slips in his vast chain of distribution, but it makes one feel better at the close of a busy day to look up the name of a manufacturer for the purpose of writing him a few deserved words of praise for something which has made the other fellow's job easier. To perform that pleasant duty is our reason for writing you.

We found some of your "Barreled Sunlight" in stock last January with a nearby dealer and made our first purchase; applying both the under-coat and then the top-coat to the whole interior of one of our bottling plants. The place at once took on the feeling of cleanliness that we all experience upon entering a hospital, and in addition it became a more cheerful place for our men to work in. It is still in that same condition, and we have no doubt will continue so for some time to come, as we have found it very easy to wash off all dirt, finger-prints, etc., without injuring the paint.

Very truly yours,

SARATOGA STATE WATERS CORPORATION
(Louis W. Noland)
BY: Louis W. Noland
Vice-President

"It became a more cheerful place for our men to work in" . . .

Lustrous, washable, durable Barreled Sunlight receives high praise from this well-known concern

EVERY plant that is painted white inside—or ought to be—can profit from the satisfying experience described in the letter reproduced above.

Barreled Sunlight *actually costs less per square foot of surface covered than any other interior paint.* It is easy to apply by brush or spray. It covers remarkably. And due to the exclusive Rice Process of manufacture, it is guaranteed to remain white longer than any gloss paint or enamel, domestic or foreign, applied under the same conditions—also not to flake or scale if properly applied.

Sold in 55- and 30-gallon churn-equipped steel drums and in cans from ½ pint to 5 gallons. Where more than one coat is required, use Barreled Sunlight Undercoat first. Note coupon below.

Stay Away from Germs and

Talk Sunlight and Happiness!

This Company's Growth Reflects the Effectiveness of a Well-planned Sales and Advertising Campaign

THE psychology of telling the public the pleasant side of life has proven itself again successful. The Sanitary Milk and Ice Cream Co. of Peru, Ind., which has recently opened a model new plant, say that "every time we have discussed the dangers of unclean milk our sales have dropped just as fast as the other fellows. We have to stay away from germs and talk sunlight and happiness."

Again is an old story repeated. Again is an old theory proven. You can tell the public that your product is comparatively free from bacteria byt the admission that there is even the possibility of there being a germ in your product will have the opposite effect from that desired.

But stress sunlight and the happiness of your workers, get the public to picture your product as being made by happy workers in a factory flooded with sunlight and you increase your business and the result is entirely beneficial.

Interesting information anent a successful sales and advertising plan has come to us from Bonsib, Inc., the advertising agency handling this end of the business for the Sanitary Milk & Ice Cream Co. of Peru, Ind. They say: "The Sanitary Milk & Ice Cream Co. has a very sound sales and advertising policy. In the first place, scrupulous care is given to make certain that the product itself is absolutely pure, clean and safe. This care starts at the farm. A fieldman educates the farmers to the proper methods of milk production so far as possible and rejects the milk when proper methods are not used in its production. That is, he refuses to take more milk from that dairy until conditions are corrected.

SANITARY MILK CO.
SANITARY MILK CO.

The Modern Sunlight Plant.

"The milk is collected by trucks operated by the Sanitary Milk Co. which further assures careful handling and quick delivery to the plant.

"Every possible effort is made to make the products look as clean as they are and the wagons are kept clean and shining so that the impression they give as they travel through the streets is favorable. The men are carefully trained and weekly meetings have had much to do with their progress and courtesy and selling ability. A trained sales and advertising manager has charge of these meetings. Not only are sales problems discussed, but every possible complaint or failure on the part of anyone in the production department to provide a satisfactory product is discussed.

"The Sanitary Milk and Ice Cream Co. has always been a consistent advertiser. We have handled their advertising for about three years. We have found that the only advertising which pays is that which talks about the healthfulness and goodness of the product. Every time we have discussed the dangers of unclean milk our sales have dropped just as fast as the other fellows. We have to stay away from germs and talk sunlight and happiness.

"The growth of the business in Peru indicates that the methods have been effective. There is a still better indication, however. Recently a route was put on in a neighboring town, Rochester, Ind. Beginning with nothing, this route was built up to a satisfactory volume in just three or four months time because we advertised heavily the advantages of pasteurized milk. Nearly all of our ads are around two columns, six inches, but we use them every day or every other day, both in Rochester and Peru. They are almost always made up from type and stock cuts so they are not expensive. Many of the illustrations are found in the newspaper mat service.

"On the whole, we feel that we have worked out a model advertising and merchandising plan for the milk plant in a small-sized town. The population of Peru is about twenty thousand and the Sanitary Milk and Ice Cream Co. has a very liberal share of the business.

"Constant publicity in the newspapers, all run free, has helped too. It's all in the ingenuity with which you make 'news' out of things that happen. The papers are glad to get stuff that is properly worded, without boasting—'good taste,' in other words."

As an example of the kind of publicity which can be obtained by furnishing it to the newspapers, is given below:

The Sunlight Milk Plant.

As the inquiring reporter was cruising aimlessly past the busy scene on the site of the new Sanitary Milk and Ice Cream Co. plant this morning, he was struck by the peculiar construction of this splendid new building.

Why, nearly half the walls are just wide openings with steel frames for the windows. What a sunlight plant this will be!

In every wall of the first floor, wide windows and doors assure ventilation and air and in the second story the whole wall on each side is almost completely made up of one wide window.

Every square foot of this building will be thoroughly saturated with light and air. Not only do the windows provide this, but two enormous light wells provide more sunlight and ventilation in the very heart of the workrooms.

In the room where milk is handled, the walls are more than seventy-five per cent windows.

All of the floors of the work-rooms are concrete, the walls are glazed brick, impervious to moisture, clean and hard. There is nothing to deteriorate and no places for water to stand. When the building is completed, the interior will be as clean and shining as the most immaculate kitchen fancy ever conceived. Surely, the government's propaganda for more sunlight and fresh air has been fully carried out in this most modern milk handling plant of the Sanitary Milk and Ice Cream Co.

These stories which gain publicity for a firm by appearance in the daily newspapers local to any community, have a high value. The trick is to so write and word them that they are news, and not at all in the nature of free advertising or boosting. A keen advertising or publicity man can do wonders in securing this sort of publicity which has a value at least nearly equal to the paid advertising.

The new plant of the Sanitary Milk and Ice Cream Co. is, as we have remarked before, a model in its every detail. Its outward appearance will be appreciated from the photograph accompanying this article.

The new building is of concrete and brick construction, 135x170 feet, with all new equipment. The plant is divided into receiving, refrigerating, general work, and cooling rooms, general offices, private office, drivers' room, store room, barn and garage in connection. It will have a large basement, ice storage room, and the refrigerating plant will have a capacity of 25 tons daily.

It is testimony to the progressiveness of the company, as well as tribute to their business ability.

⁂

TWO MILK PLANTS JOIN IN MERGER.

The merger of two of the Muskegon (Mich.) leading dairy companies was announced some time ago.

The entire properties of the Muskegon Dairy Company at 490 W. Muskegon Avenue will be taken over by the Sanitary Dairy Co. The new combined business, however, will be centered at the Sanitary Dairy plant at 1788 Terrace Street, adjacent to the Grand Truck railroad tracks. The Muskegon Dairy plant will be closed and its equipment moved to the other building.

Employees to Remain.

J. M. Knutson, president of the Muskegon Dairy, and all of the employees of the company will become a part of the new organization. Mr. Knutson will remain with the combination for an indefinite period of time and later will become active in his interests in the Woodlawn Piston Ring Company which is preparing to build and expand its business in the near future.

Drivers employed by the Muskegon Dairy will become the employees of the Sanitary Dairy and will, insofar as is possible, be kept on the same milk routes. Considerable overlapping of the routes covered by the two companies will be eliminated in the reorganization, however, and each individual driver's territory will be cut down to some extent. Approximately the same number of men will be employed.

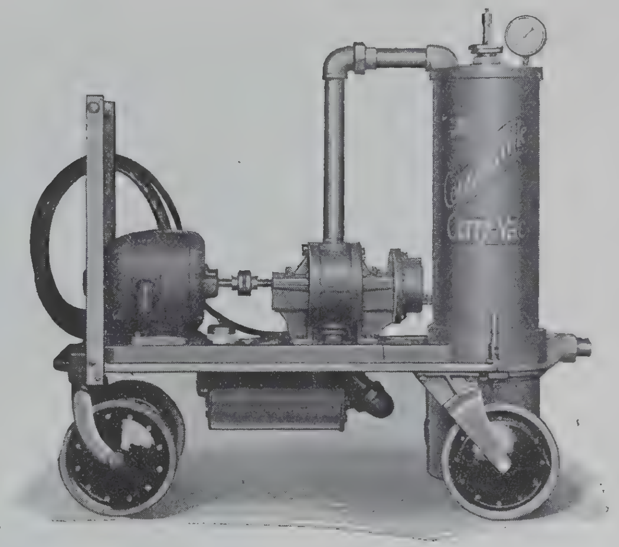
Organized Six Years.

The Sanitary Dairy Company was organized six years ago by Charles L. Peterson, Clarence A. Peterson and Charles L. Peterson, Jr. The latter had been a partner in the Muskegon Dairy Company for two years previous to the organization of the new milk concern.

Three years ago, the father and two sons were joined by another son, Howard C. Peterson, now vice-president of the company. Howard had been for several years superintendent of the Forest Glen Creamery Company of Chicago, before coming to Muskegon to enter the business with his father and two brothers.

It is expected that some enlargement of the plant of the new company which starts business as such tomorrow may be necessary in the near future.

Here Is The Curry-Vac



As Shown At Detroit Exposition

This sturdy and efficient currying machine was first shown at the Detroit Exposition.

The compactness of build, and the ease of handling, immediately won the interest of those attending. After seeing its superior work demonstrated, it was pronounced the most advanced Vacuum Currying machine.

This Curry-Vac is operated by a ¾ HP motor. The motor is direct connected by flexible coupling to the vacuum producer, thus assuring the proper speed and eliminating the possibility of slipping belt.

Write for information on this money-making machine.

Please send information on ( ) Truck ( ) Stationary Type Curry-Vacs for ( ) Horses ( ) Cows.

Mortar—1:3

CONSTRUCTION DETAILS

Foundation.

After carefully marking out the foundation, excavate the trench so that the sides are even and vertical. If the earth walls of the trench are firm, forms will not be necessary for that part of the foundation wall below grade. If the soil is not firm, additional excavation will be necessary to permit using forms to construct the foundation walls.

Well constructed milk houses are saving dairymen of this country thousands of dollars annually by providing suitable places for cooling and holding milk. Without proper cooling facilities, milk soon sours, causing heavy loss to the producer. Agricultural authorities consider a good milk house, built separate from the barn, a necessary adjunct on the dairy farm. In such a house milk can be kept in a sanitary condition where there is little possibility of its becoming contaminated.

For the wall above grade forms may be made with 1 by 6-inch boards, well braced. Concrete mixed in the proportion of 1 part cement, 2½ parts sand and 4 parts pebbles or broken stone, is satisfactory for the foundation. The latter should be carried below the frost line to prevent upheaval by freezing.

Building the Wall.

The mortar used in the concrete masonry walls should be mixed in the proportion of one sack of portland cement to 3 cubic feet of clean, well-graded sand. A small amount of hydrated or slaked lime (not to exceed 10 pounds per sack of cement) may be added to the mortar to make it more plastic.

Door and window frames are set and built in place as the blocks are laid. The usual method of attaching plates is to bolt them down at intervals of 4 or 5 feet to the top course of block. Bolts should be long enough to extend through one course of block and the plate. Cores of the block where bolts occur are filled with concrete to insure firm anchorage.

Milk Cooling Tanks.

Reinforced concrete milk cooling tanks may be made either with or without insulation. Suggested plans, including construction details and drawings, for both types of tanks are given on the following page. Corkboard insulation is used in the tank shown in Figures III and IV, although any other suitable insulating material may be employed in place of the cork, if desired.

When milk is cooled by well or spring water, a minimum net width of 24 inches is recommended for the tank, but in case either iced water or mechanical refrigeration is used this width may be reduced to 19 inches. The tank is made only deep enough to permit water to come well up on the neck of the cans. To lighten the labor of lifting cans in and out of the tank, part of its depth is below floor level. The length is variable, depending upon the capacity desired.

If ice is not available, milk usually can be cooled to 55 degrees F. or lower by circulating spring or well water through the tank. A uniform flow of water is secured by placing the inlet pipe at one end of the tank and the outlet or overflow pipe at the opposite end. The overflow pipe screws into the outlet drain and is equal in length to the depth of the water desired The grooves in the tank floor permit water to circulate freely under the cans, resulting in more rapid cooling of the milk. These grooves are made by pressing wood strips in the concrete at the time floor is finished. Before the concrete has hardened the strips are removed.

When the tank shown in Figure II is built, the floor and walls are concreted in one operation. The floor of the tank is made 6 inches thick and the walls, 4 inches. Reinforcement consists of ⅜-inch rods spaced 12 inches apart. The reinforcement of the floor and walls is made continuous by bending the rods "U" shaped. Rods are also extended around the tank walls, with ends lapped at least 12 inches. At all intersections reinforcing rods are firmly wired together to hold them in correct position.

Reinforcement for an insulated tank is practically the same as for the tank already described. Rods are placed only in the outer walls. This is done before any concrete is deposited.

A 1:2:3 concrete mixture for either type of tank is considered most satisfactory. Screened gravel or crushed stone up to one inch in size may be used. Information on how to make good concrete will be found on page 4. Simple forms for building the tank walls are shown in Figure I.

Figures III and IV show details of an insulated tank in which corkboard is used as the insulating material. The concrete base below the corkboard should not be less than 3 inches thick and is placed first after the reinforcing rods are arranged in place. Two-inch corkboard mopped with hot asphalt is then laid on the base, also painted with hot asphalt. The corkboard for walls is dipped in or painted with hot asphalt at the same time. Coal tar pitch may be used if asphalt is not available. Wooden forms for both the outside and inside walls of the tank are placed next and 2-inch corkboard for wall insulation is erected, making certain that all abutting edges between sections are thoroughly covered with asphalt. Corkboard must be braced to prevent displacement. Outside and inside walls are made the same thickness as the lower base of the tank—3 inches. Forms are then filled with concrete of a consistency that will place readily. A sloppy mix should be avoided. Bolts to which wooden plate or rail around top of tank is to be attached are placed in top of walls. The concrete base of the inner tank is placed next, making it four inches thick as is shown in Figure IV.

Mechanical refrigeration may be easily installed. An opening for the coil may be made in the wooden rail or in the concrete wall of the tank, according to manufacturer's directions. If it is desired to build the tank so that mechanical refrigeration may be employed at some future date, it would be well to provide an opening for installation of the coil. This hole may be filled with a wooden plug until the cooling apparatus is installed. Three-inch corkboard installation is usually recommended when the tank is built for mechanical refrigeration.

The wood cover for the tank should fit snugly and be of rigid construction to prevent warping. The framework is covered with dressed and matched boards after corkboard has been placed in the frame. The cover is fastened in place with galvanized hinges and should be thoroughly painted on all sides and edges.

Placing the Floor.

When the ground on which milk house is to be located is sloping, the area should be leveled off and

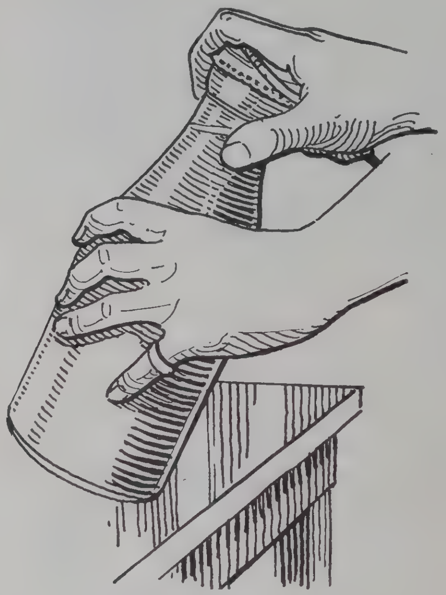
THE

DACRO

METAL CAP

Here at last is the perfect package of Milk or Cream, pure and sweet pasteurized IN the bottle! Made possible by a mechanically perfect closure.



Pure, sweet MILK—delivered under hermetic seal to the home. Handy openers supplied at small cost.

The Dacro Metal Crown—This remarkable cap is made on exactly the same principle as the famous Crown Cork which revolutionized the bottled beverage industry. The Dacro Crown is a hermetic seal. It automatically locks under the glass rim of the bottle. It is scientifically a perfect closure. Sealed with the Dacro Crown, Milk or Cream can be pasteurized in the bottle, an exclusive advantage of this seal. The Dacro Crown covers and protects the pouring lip. It KEEPS clean milk clean! No danger of contamination or tampering with pure contents. And the Dacro Crown can be replaced for temporary covering and seal after opening bottle.

PASTEURIZE YOUR MILK
IN-THE-BOTTLE

THE
Crown Cork & Seal Co.
BALTIMORE, U. S. A.

Inventors and originators of the famous "Crown Cork"

tamped so that the entire floor rests on firm soil. A 5 inch floor made of 1:2:3 concrete is generally used, with stone or gravel not larger than 1½ inches in size. One course construction is recommended which means tha the full thickness (5 inches) of concrete is placed in on operation, and thoroughly tamped. A dense, even surface is produced by smoothing with a wood float. A little 1:2 mortar may be used in finishing, if needed.

How to Make Good Concrete.

The materials used in making concrete are portlan cement, sand, pebbles or crushed rock, and water. Th rules for making concrete are easily understood and fo uniformly successful work they must be carefully followed.

Proper Proportioning.

Concrete mixtures are usually expressed as a 1:2: mixture, a 1:2½:4 mixture, etc. The first figure denote the number of parts of portland cement, the second figure, the number of parts of sand, and the third figure the amount of pebbles or broken stone. For example a 1:2:3 mixture means that for each sack of cemen there should be used 2 cubic feet of sand and 3 cubic fee of pebbles or crushed rock.

Accurate Measuring—Thorough Mixing.

It is important that the materials be measured accurately. A pail or box or wheelbarrow may be use for the purpose, whichever is most convenient. Mixin may be done either by hand or by machine but it mus be continued until every particle of sand and stone i completely covered with a coating of cement mortar an the mass is uniform throughout. Use only enough wate to produce a plastic, quaky mixture that is readily workable. Avoid using a sloppy mixture.

Placing Concrete in Forms.

The newly mixed concrete should be placed in th forms within 30 minutes after it is mixed. As it is bein placed in the forms, it should be tamped or spaded. Thi operation makes the concrete dense and improves th surface.

Protect and Cure Carefully.

Do not permit the newly placed concrete to dry ou for a week or ten days. Protect it from sun and dryin winds; otherwise the water necessary for the prope hardening will evaporate, resulting in a loss of strength Floors, walks, and similar surfaces can be protected b covering with moist earth, hay or straw, as soon as th concrete has hardened sufficiently so that the surfac will not be injured. This cover should remain on for week or 10 days and be kept moist by occasiona sprinkling.

Suitable Materials.

To make good concrete, it is necessary to use prope materials. Both sand and pebbles should be clean an free from dirt or organic matter. Such substances pr vent proper bond between the cement and particles o sand and pebbles or crushed rock. By sand is mean that material ranging in size from fine up to that whic would just pass through a screen with ¼-inch opening Coarse sand makes better concrete than fine sand. Th material that will not pass through the ¼-inch scree is referred to as coarse aggregate. The particles o coarse aggregate may range from ¼-inch to 1½ inche or more in size according to the nature of the wor Crushed rock or screened gravel may be used for th purpose. Bank run gravel (just as it comes from th pit) should not be used without separation. It must b screened to separate sand and pebbles, which are the recombined in proper proportion for the work at han Water used in mixing should be clean; if it is fit f drinking, it is suitable for use in concrete.

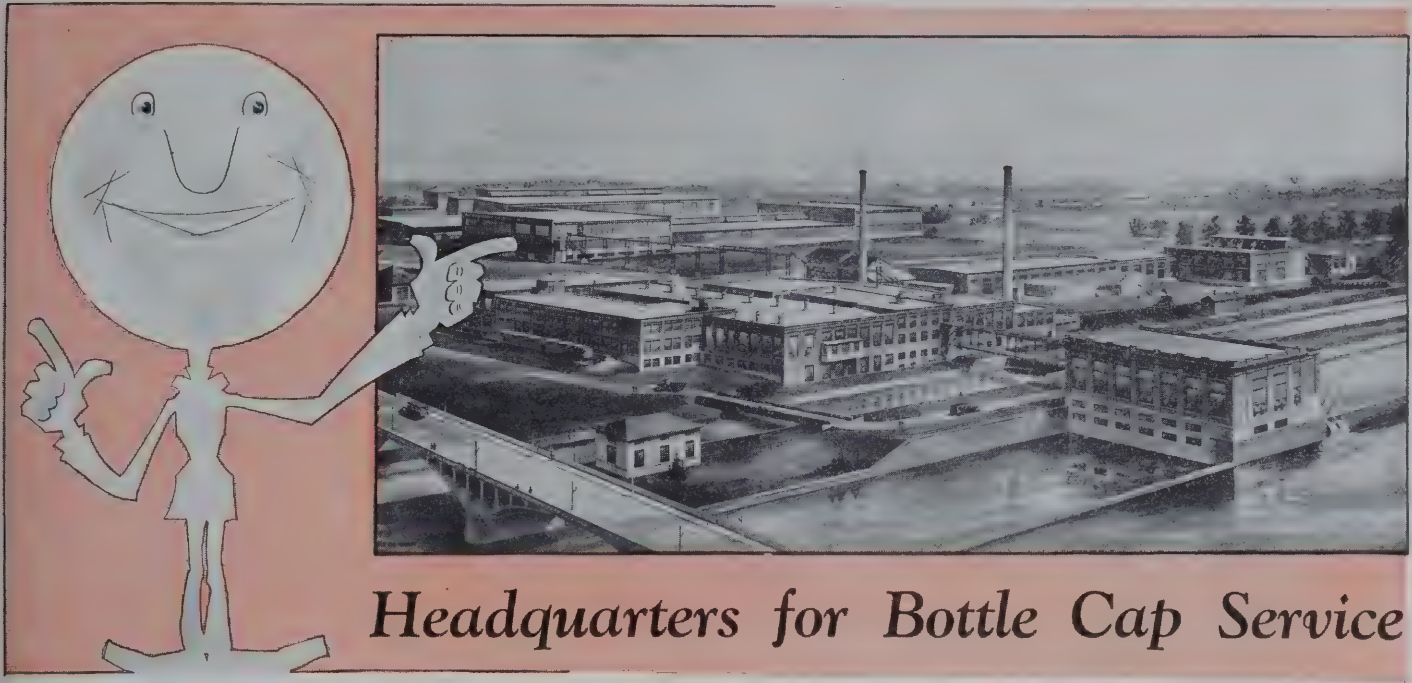
ATLANTIC BOTTLE COMPANY
Factory: BRACKENRIDGE, PA.
90 W. BROADWAY, NEW YORK
327 SO. LA SALLE STREET, CHICAGO



Headquarters for Bottle Cap Service

LOCATED at one of the finest distributing points in the country, the giant Sealright Plant is always ready to back up its guarantee of prompt service at all times. One-half the population of the United States is within one night's ride on a passenger train. Yet the Sealright Plant is ideally located for advantageous production, making and selling more milk bottle caps than any other manufacturer in America.

Sealright Caps are made of Fulton Board, a superfine spruce log product, time-dried and absolutely waterproofed by a scientific paraffining process. Sealright Caps never fail to weather the worst conditions to which a milk bottle cap is subjected. Whether under ice or water they retain their firmness, which assures leak-proof protection for bottled milk until ready to serve. Their clean cut edges, exact diameters, and uniform thickness prevent clogging in capping machines, and insure a perfect fit in cap seat.

Milk drinkers in all parts of the country know the advantages of Sealright Milk Bottle Caps—particularly the Sealright Pouring-Pull Cap which has been advertised through the pages of *The Saturday Evening Post* into the homes of the best people in almost every city and town in the United States. It is known everywhere as the milk bottle cap three times more useful:

1. A safe, clean way of quickly removing cap — just lift tab and pull.
2. A safe, clean way of pouring without spilling, thru opening in cap.
3. A more healthful way of drinking milk by inserting straw thru cap opening.

You will profit by using Sealright Caps. Send us coupon for samples today.

Hoosier State Dairy goes "over the top"~sells more milk

THE Reliable Dairy Company, South Bend, Ind., says Thatcher advertising has helped it and the dairy industry as a whole by increasing the public interest in milk from a health standpoint and by helping to offset canned milk competition.

> *"We have used Thatcher Bottles for ten years," writes this wide-awake dairy. "We use Thatcher Posters on all our wagons and windows and in schools and restaurants. We take full advantage of the popular Thatcher slogan: 'A Bottle of Milk Is A Bottle of Health,' by painting it on our wagons. Yes, it pays us to do so. Our milk sales jumped 20% in one year as a result."*

It will pay you, too, to be known as the Thatcher dairyman in your city!

Visit the Thatcher Exhibit at the Dairy Show. A royal welcome and something interesting is guaranteed.

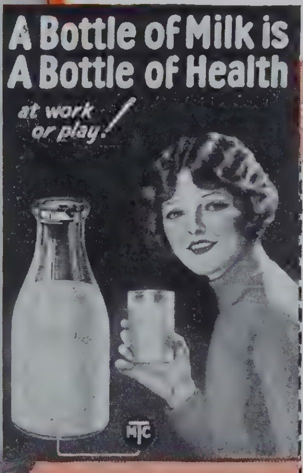
"MORE TRIPS PER BOTTLE"

The most important item in buying milk bottles, is the final cost per bottle to you. The first cost or purchase price means little or nothing to you. From the actual experiences of dairymen and from exhaustive laboratory tests, it has been definitely proved that Thatcher Superior Quality Milk Bottles will give you more trips per bottle. For Thatcher Bottles are tougher, more uniform in quality, have a better distribution of glass, and consistently perform better in actual service than any other bottle made.

Specially designed lehrs, used exclusively by Thatcher, help to give Thatcher bottles that superior quality and wear-resisting toughness not found in ordinary bottles. The Thatcher Trade-mark is blown in on every Thatcher Bottle for your protection and guarantee. Then, too, millions of milk users see and read the celebrated "A Bottle of Milk Is A Bottle of Health" advertisements of Thatcher Bottles in The Saturday Evening Post and Good Housekeeping Magazine. If you want to increase your milk sales, fill in and mail the attached coupon. It will pay you to act at once.

THATCHER MANUFACTURING COMPANY, Elmira, N. Y.

Operating several plants throughout the country, each strategically located and devoted exclusively to making Superior Quality Milk Bottles. Prompt, efficient service—always.



Put this Attractive Poster on your Wagons and Windows. Get your supply now.

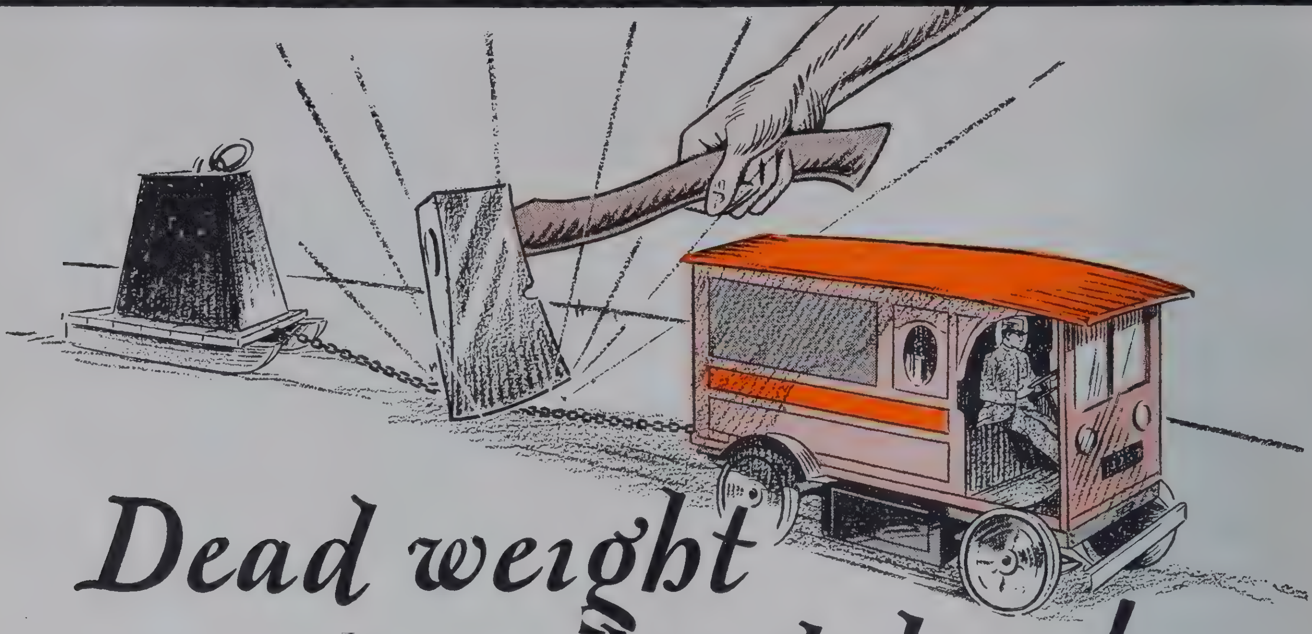
Cost Less Because They Last Longer

THATCHER
Superior Quality
MILK BOTTLES



Dead weight is a dead loss!

IT costs too much to operate electric trucks burdened down with heavy battery equipment. There is more wear on the chassis and tires, and the added dead weight means reduced ton-mile capacity for the profitable pay load.

Excess battery load is a dead loss. The lighter the battery the greater your profit.

Edison Truck Batteries are lighter in weight than any other batteries of commercial importance on the market—from a third to 40%! They are made of *steel,* with iron and nickel elements.

When you equip your electrics with Edison Batteries you will realize, directly, one of two things—either fewer trucks for the same work-output, or more work from the same trucks. In either event lower costs are inevitable.

This initial cost-advantage with the notably longer life, sustained power capacity, cleanliness, low maintenance and all-around dependability, assure very definite savings. Edison Batteries are preferred by truck users because they have proved the most satisfactory.

There are more Edisons in motive power service today than all other makes combined. May we send you the figures?

HAUL MORE FOR LESS MONEY

NEBRASKA FIRM EXPANDS.

Sanitation and quality have been placed on a high pedestal by the Koser Dairy and Ice Cream Co., which recently opened its new plant at 19th St. and Warren Ave., Lincoln, Neb.

The new building is equipped with strictly modern equipment for the pasteurizing and bottling of milk and the manufacture of ice cream.

The building is of modern style constructed of yellow pressed brick, one story, with a seventy-five foot frontage. Practically a solid array of plate glass windows admit light to the building from three sides with a skylight in the roof. Sunlight is one of the key notes to sanitation and of sunlight, the Koser company has an abundance.

The building faces the east with three doors opening into the street. One goes to the central office, one to a private office and the other to the dairy room.

The inside of the structure is as fresh and clean looking as the exterior. White rough plaster covers the ceiling and side walls except for a continuous panel going around the side of imitation white tile. The floor in the dairy room is of composition concrete. In the offices it is of imitation marble with a curved base so that dust and dirt may easily be swept out.

About six years ago the company began operation in an adjacent building, but steady growth in the business made necessary the erection of the new structure. G. W. Koser and his two sons, Merle G. and G. R., operate the plant.

The milk is obtained through contracts with reliable farmers near the city.

Each morning a truck goes out to these farms and brings the milk in fresh. It is then pasteurized, tested and cooled. Then it is bottled and placed in a large refrigerator. The refrigeration plant in the new building is another feature. Besides keeping the milk ice cold in the ice box, its pipes run through the vats and circulate about the cooling pipes to keep the milk at as low a temperature as possible.

Up to the present time, the company has dealt only in milk. In the new building, however, a complete ice cream manufacturing device has been installed, with the very latest equipment. Great care is used in selecting the raw products for making the ice confection, we are told.

The milk will continue to be sold retail but the ice cream, which will be known as Koser's Perfection, will be sold wholesale to dealers. Increased business has caused the expansion of this firm. Those connected with it feel that future prospects are still brighter.

⁂

WEED OUT THE WASTE.

The Honorable James Francis Burke in a recent address said: "The new watchword for both business and government is WEED OUT THE WASTE." He further said that the world is realizing that improved manufacturing methods are adding to the pleasure of living. As the comfort and contentment of the masses are increased, the stability of trade and the security of investment are likewise promoted. Reducing lost motion, cutting out elements of waste, eliminating too high a degree of diversification of products, and doing away with a large number of unnecessary plants that rest like crushing weights on the back of American industry—all of these are steps toward economy and efficiency, increased profits to the manufacturer, increased wages to labor and lower prices to the consumer.

Economic Reasons Why the Dairyman Has Special Interest in Conveying Equipment

An Observation of the Dairy Industry, from the Viewpoint of a Material Handling Expert

By GEO. AGRY*

THAT American industry is in the midst of a production epoch that may be rightly termed "The Epoch of Development of Improved Materials Handling Methods" there can be no question. Long has American industry, in general, worked to improve its products; long has it studied and developed marvelous automatic machinery for economical manufacture. Great advances have been made in efficiency of business organization through improved methods of bookkeeping, cost keeping and pricing, helped greatly by the perfecting of what may be termed "Business Efficiency Machines," the typewriter, the adding machine, modern filing equipment. Even more recently has industry come to a just appreciation of the importance which materials handling methods bear to efficiency in production, to a lowering of manufacturing costs and to improved service to the consumer, as represented by prompter deliveries and lower prices.

It was the World War that put the "stamp of approval" on the employment of automatic carrying devices. Faced with a necessity for intensive and voluminous production with a shortage of manual labor, it was natural that industry should adopt with enthusiasm everything which would enable it to produce in more volume than ever before despite the shortage of

man-power. The accomplishments of automatic conveyors were quickly learned. It was realized that they could perform the functions of carrying and toting better, more economically, and more expeditiously than was possible with human labor. Industry came out of the war-time period with a proven realization of the economic advantage of employing machinery for the performance of any kind of work which machines will accomplish, thus relieving human brains and human hands for the many important tasks which human beings are alone capable of accomplishing.

Since that time, tremendous advances have been made in the design and application of conveying machinery to industrial purposes. Automatic carrying of raw materials, of products in processes of manufacture and fabrication, together with finished merchandise, have effected tremendous economies. Intervals of time of manufacture have been reduced, floor space has been saved, human labor has been relieved for more productive tasks, work in process has been expedited, costs have been lowered and many other economic advantages have been obtained by the widespread adoption of automatic conveying machinery throughout the industry in general.

Now in what way is the dairy and milk bottling industry comparable with other industrial enterprises? In the matter of extent and necessary frequency of handling materials perhaps no other industry can be compared with it. In the handing of milk, operations occur day in and day out with no intervals of non-production due to Sundays and holidays. The usual manufacturing plant closes over Sunday and shuts down for various holidays, but plants which are devoted to the vital necessity of milk production must operate daily. Day after day milk is received, weighed and passed through the processes for which each plant is intended with no interruption of daily operations.

Thus when the usual manufacturing plant can effect economies by the employment of conveying machinery, how much more so, in proportion to the size of each milk producing unit, can the milkman profit by the employment of automatic carrying devices. Especially is this true since conveyors which adequately meet the requirements of a milk handling plant are for the most part simple in design and extremely economical in operation.

One of the most commonly employed types of conveyors for the handling of package loads is a gravity roller conveyor. This conveyor is constructed with steel frames into which are set load carrying rollers, the spacing of the rollers being dependent upon the size and type of load. Rollers are commonly made of steel tubing and turn either on ball bearings or bearings especially designed to meet the requirements of various industries and the types of loads to be carried. When such a conveyor is set at a sloping angle, loads are carried forward over the rollers by the force of gravity. Thus gravity roller conveyor requires no power, except where it is necessary to install power units in order to raise the load for further travel.

To properly design gravity roller conveyors suited to meet the arduous tasks imposed upon them by the usual milk bottling establishment is no mean task. Many dairymen have experienced difficulty in keeping gravity roller conveyors of the usual ball bearing type in proper operation due to the fact that accumulated milk has caused lactic acid to eat the bearings and due also to the necessity of daily cleaning of the conveyors in the filling room with live steam and hot water which has caused corrosion to conveyors of a design which functions properly under less strenuous circumstances. It is probable that the difficulties formerly experienced have started some milk plant managers in the more extensive adoption of conveying apparatus.

It was realized some time ago by the engineers of the company with which the author of this article is connected that while the usual ball bearing conveyor was not suited to the special tasks imposed upon it by a milk plant, nevertheless a gravity conveyor especially adapted to milk plant purposes could and must be perfected. That plants of both large and small size should take full advantage of the use of gravity conveyors, the problem of a satisfactory design for the purpose necessitated not only a design which would overcome former objectional features, but also a type of construction so that conveyors employing many bearings could be produced at a sufficiently low cost to make them a real profitable investment for all milk plant users.

The result of extensive designs and experiments has been the perfecting of a conveyor, the rolls of which turn in special bearings machined from a solid hexagonal bar of acid resisting material. Rollers, too, have been especially designed with hermetically sealed heads in a manner so that water, milk or steam cannot penetrate the roll, thus making it easy to keep rollers and bearings clean, sweet and sanitary. Conveyor frames have been arranged in a special manner to enable easy cleaning and to prevent accumulation of dirt on the frame angles.

It is not intimated that gravity roller conveyors of the ball bearing type should be superseded by gravity conveyors equipped with a special sanitary type of bearing in every instance, but rather that in such departments as an acid and corrosion resistant type of conveyor is best adapted, a conveyor of such a design has been perfected which is within the reach of all purchasers.

Other types of package handling conveyors find suitable use in dairy operations, including slat, belt and chain conveyors, but by far, the type of conveyor which finds opportunity for the most extensive service is the gravity roller conveyor.

No doubt there will be interest in a listing of the services which conveyors are rendering in two prominent types of milk plants.

First, the receiving plant. Conveyors are being effectively employed for handling filled cans from farmers' trucks to "weigh cans." The empty cans are then taken by conveyors to the can washers and are carried from the washers to a point outside the plant where they are called for by the farmers' trucks. In a receiving plant so equipped in which all carrying of cans is done by conveyors the day to day operations are greatly facilitated.

Second, the milk bottling plant. Conveyors are rendering extremely profitable service for the following operations of a milk bottling plant: Handling incoming cases of soiled bottles, carrying incoming filled milk cans, passing cases of soiled bottles to bottle and can washers. Cases of clean bottles are efficiently passed to storage by conveyors, thence to bottle filling. The further function of conveyors is for handling cases of filled bottles to refrigerator and thence to delivery truck loading platform. Empty cans are rightly returned to farmers' trucks by conveyor.

In a later article will be given details of effective arrangement of conveying apparatus for various purposes, including suggested sizes of conveyors for handling various sizes of loads. The present purpose is to stress that the economies effected by the use of conveyors throughout industry in general are causing so extensive

In Bottle Crates, as in Automobiles----

MODEL I-C INSIDE CONSTRUCTION is designed for *LONG LIFE of the Bottle* and *Protection of its Contents.* Our new SAFETY GRID prevents contact of Bottles at Bottom, Shoulder, and Lip.

Make this test—if you are *not* now using Wildberg Crates—put two bottles in adjacent pockets and see how easily you can hit one with the other.

Then send to us for a sample MODEL I-C and you will be surprised at the protection your bottles will get.

This sample crate will be sent to you FREE OF CHARGE, EXPRESS PREPAID, with no obligation on your part. Please mention whether you use two or three rows of division wires and whether standard size or compact.

THE WILDBERG BOX CO., Cincinnati, Ohio

World's Largest Manufacturers of Milk Bottle Crates

adoptions of conveying apparatus as to represent an epoch of mechanical carrying study and adoption by industry.

The necessity of daily operations in the dairy industry is more insistent than that of almost any other line of production.

Conveyor manufacturers have recognized the need of producing types of conveyors particularly suited to dairy purposes.

Each dairy operator will do well to carefully investigate the economies and efficiency which can be brought about by the adaption of conveyors to his particular requirement. Studies can be undertaken with the conveyor manufacturer as advisor which will lead to a definite understanding of just what can be accomplished for each installation.

Perhaps in no other industry does the roller conveyor render itself so serviceable.

Florida Receives a Gift of Milk

Florida Called and the Chicago Milk Distributors' Association Heard and Came to Its Aid

TOO often, we hear of statements to the effect that the American business man has no heart; that he is interested only in his business and in pursuit of the dollar; and that he would go to any extremes to gain his end. Let a man who is commonly termed "Big Business" attempt to get a monopoly and corner the market on the available supply of Mah Jong sets and the world in general howls to the high heavens that they are being ground under the oppressive heel of "Capital."

In the September issue of The Milk Dealer, there was an article dealing with the dairy conditions in Florida and headed "Florida is Calling." The head was extremely timely and very much to the point; for on the day that the issue was mailed the country was stunned with the news of a catastrophe that came out of the sea and gripped parts of the state in its ghostly grip. Cities, where a week previous gay crowds had thronged and made merry in this winter playground, there was now only ruin and desolation. Tales of heroism, of sacrifice, and of the extent of the damage finally filtered through to the outside world.

The Spectre of Starvation.

Fortunes were shattered in many cases, but at such a time money has but little value. Money will not buy food or water when it is not to be had. With starvation facing them, Floridans, still in a daze, appealed to the rest of the country for aid—they needed food, clothing, hospital supplies for the injured and a host of other necessities, but most of all they needed food. They needed it hurriedly, for the suffering among the children was great.

The country heard the call. Money was given generously. Preparations were made by various agencies to ship necessities to the stricken state.

When the news of the Florida disaster first came in, the Chicago Milk Distributors' Association knew that there would, undoubtedly, be much suffering from hunger; especially so among the poor helpless tots who would be unable to help themselves and could not eat the heavier, coarser food that would probably be the only kind available for several days. The Chicago Milk Distributors' Association accordingly acted, and they acted with unction. They knew that their product was needed in the stricken area. Needed for the children, and needed because its bulk supplied all of the food requirements.

Fresh Milk by Tank Car.

It is hard to tell if the membership of the Chicago Milk Distributors' Association is composed of men who might be classed as "Big Business." Perhaps, they are, for Chicago is a large city and they supply the city with milk. However, if they are, they are not living up to the way that the soap-box orator has him painted; for when the news of the Florida storm came through, they were interested in other things than their business, and they evidently had a heart, for immediately the decision was made that Florida wanted milk and that they were going to get it. A canvass was made of Chicago to ascertain the amount of milk available. It was found to be insufficient. A tank car was rushed to Janesville, Wis. All night trucks brought loads to the milk depots in the vicinity and the work of pasteurization went on through the night. In the morning the tank car was full and on its way to Miami—a gift from the Chicago Milk Distributors' Association.

The gift was not heralded from the house tops when it was made; it was not "put on the air." The members of the association were content to have done something to relieve a fellow being and perhaps save the life of some little mite. Finally, news of the gift reached the newspapers. They devoted some space to it. What reaction did it give the professional savior who makes it his self appointed duty to relate the injustice of "Big Business?"

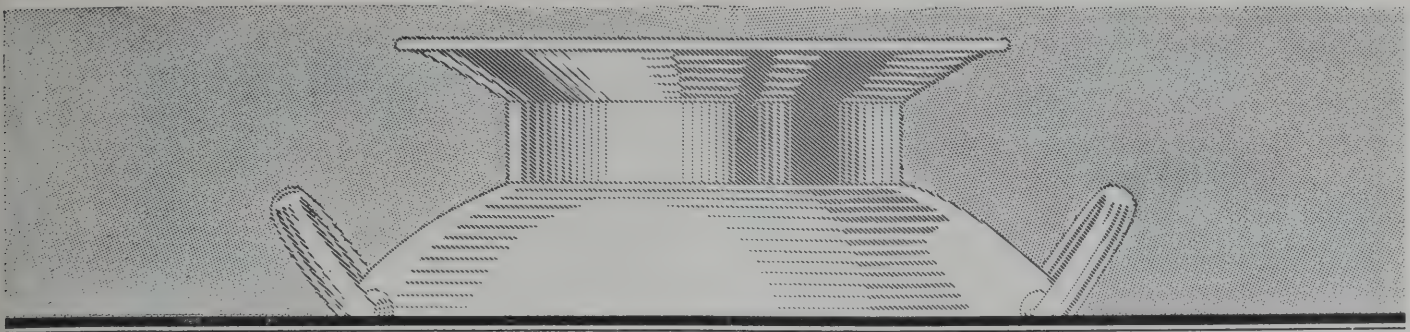
The American Car Company spotted a glass-lined refrigerated milk tank car in Chicago and dispatched it to Janesville, Wis. The milk distributors of Chicago generously arranged for the filling of the car with 48,000 pints of fresh Wisconsin milk. Thursday night the car was already back in Chicago at the head of a passenger train bound for Cincinnati. Sunday morning at one o'clock the car arrived at Miami with its life-saving cargo of fresh, tuberculin-tested, pasteurized milk in perfect condition.

The railroads, too, played a big part in this achievement, for through the co-operation of the Chicago, Milwaukee & St. Paul, the Chicago and North Western, the Pennsylvania, the Southern and the Florida East Coast Railway the milk car arrived in record time, 76 hours. The car was in actual transit only 54 hours after having been loaded.

This Florida emergency trip is a spectacular performance, but its larger significance lies in the demonstration that milk, a highly perishable, vital human food can be successfully and quickly transported long distances under diverse climatic conditions.

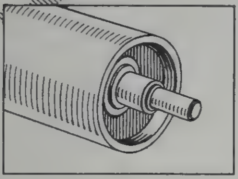
STANDARDIZATION ELIMINATES WASTE.

Under the title, "An American Initiative and Fight Against Waste," Henry Le Chatelier of Paris, in a recent bulletin, comments: "In order to understand the prosperity of the United States, it will not do merely to examine their industrial realization in detail; it will be necessary to study as well the hidden and profound causes of their success. Standardization as now prosecuted under the impulse of the department of commerce is the result of a long series of efforts....."



5 features found only in the Lamson Sanitary Conveyor—

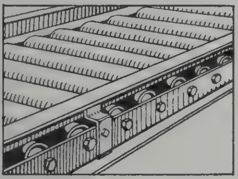
Especially designed for dairies



1

1. Roller sealed so no moisture can enter.

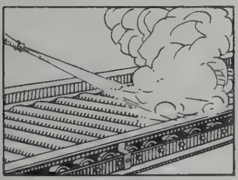
Keep the moisture out and you keep away corrosion. The roller is extra-heavy, and the heads are WELDED in. The inside of the roller is always perfectly dry and clean. The ordinary roller gives out because of inside corrosion. You'll never have that with the Lamson Roller.



2

2. The special guard-rail.

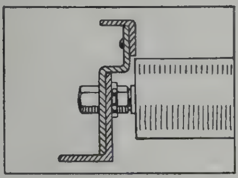
The heavy angle-iron guard-rail sets in over the ends of the rollers. This prevents the chimes of the cans or edges of bottle cases from ever slipping down off the roller ends. The Lamson Conveyor never stalls or blocks.



3

3. Can be safely flushed or steamed.

The Lamson Sanitary Conveyor stands up under all methods of cleaning. Flush it with hot water as often as you please. Steam it whenever you wish. Whatever you do, you will do no harm to bearings or rollers. The Lamson Conveyor has been designed throughout with the necessity for frequent cleaning in mind.



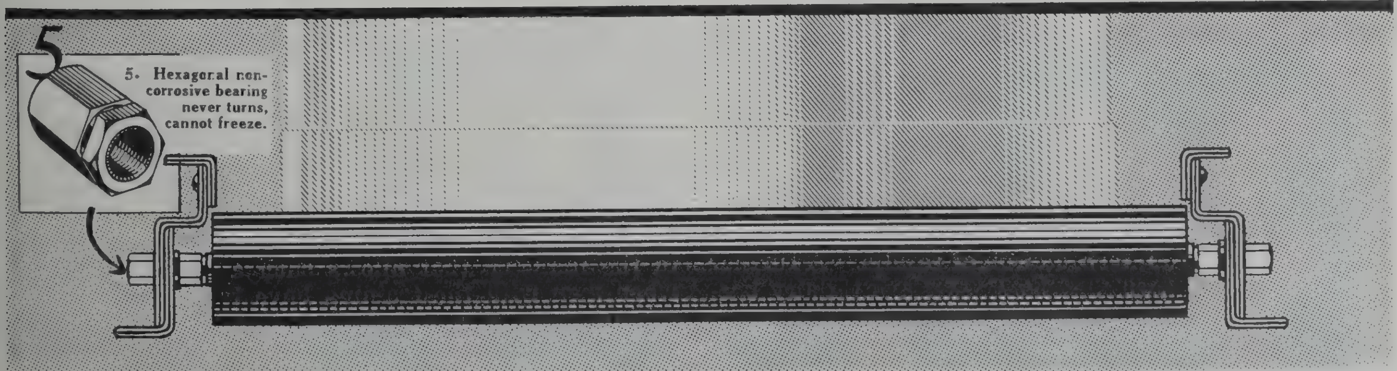
4

4. Moisture and Acid resistance throughout.

This sturdy, heavy-duty conveyor is built to resist wear and corrosion, even in the little details. Note how the design of the frame-work forms a cup-like cross-section that keeps moisture and milk away from the shafts and non-corrosive alley bearings. This special equipment will pay for itself in longer wear and better service. Write for full details.

THE LAMSON COMPANY, SYRACUSE, N. Y.

LAMSON CONVEYORS



5
5. Hexagonal non-corrosive bearing never turns, cannot freeze.

Qualitative or Quantitative?

Most Authorities Agree That Present Methods and Practices Are Working Against the Milk Industry

SOMEONE remarked, sometime in the past, that "too much education is a dangerous thing." Perhaps, the expression would have been better if it had been modified to "too much of the wrong kind of education is a dangerous thing." However, if too much is dangerous, too little is dynamite; and no better example can be offeed than the education that people have received regarding bacterial counts.

To them a bacterial count of 30,000 means just that many "microbes," "germs" or disseminators of plague and pestilence. They read the current bacterial counts in the daily press, and are immediately struck with the idea that the bacteria found in the milk are all of the harmful type. That there is room for a change in methods of conducting bacterial counts is very apparent, but at the present time, the plate method is the most satisfactory method of determining the qualities of milk.

Need of Constructive Advertising.

Perhaps, it is a question of advertising to give the consumers information concerning bacterial counts. Certainly, it would be valuable in clearing the atmosphere and the qualms that the layman has regarding a bacterial count that to a milk dealer or a bacteriologist is regarded as relatively low.

In the September issue of The Milk Dealer, the opinions of two men who are regarded very highly in the dairy industries gave their opinions in reference to bacterial counts. B. W. Hammer, dairy bacteriologist at Iowa State College, stated that while he admitted the error of the present plate method, he thought that the good points far outweighed the weaknesses. G. L. A. Ruehle, dairy bacteriologist at Michigan State College, gave his opinion that the present methods left much to be desired.

H. Macy, assistant professor of dairy bacteriology at the University of Minnesota, says: "The history of our present standard methods for the bacteriological analysis of milk has been featured by the realization of the short-comings of the methods suggested. This is particularly true of the ordinary plate method which has been most widely adopted. Nevertheless, with all the discrepancies the method is not worthless nor ready for abandonment."

Public Has Wrong Interpretation.

It has been the contention of The Milk Dealer that the methods as they now exist when given to the press with no explanation of the results are misleading to the public and are apt to be very much misunderstood. Continuing, Prof. Macy writes: "The greatest difficulty, I feel, has been in the interpretation of results." A further example of this is furnished by E. H. Parfitt, dairy bacteriologist of Purdue University, who says: "In some ways the quantitative count has done injury to the milk business. This is especially true where health authorities take one sample of milk per month, make an analysis of it, and then publish that analysis in the local papers. The consumer of milk is oftentimes misled. I recall one instance where a milkman had his milk reported with a bacterial content running into the millions but his fat content was low. He was informed by one of his customers that though other milkmen had higher fat content than he, he was so far ahead in bacterial content that she knew that his milk must be of much higher quality. Such instances as that, and then too, the consumers complaining and changing milkmen because there is a variation of two to three thousand per cubic centimeter, has wrought a hardship on the industry."

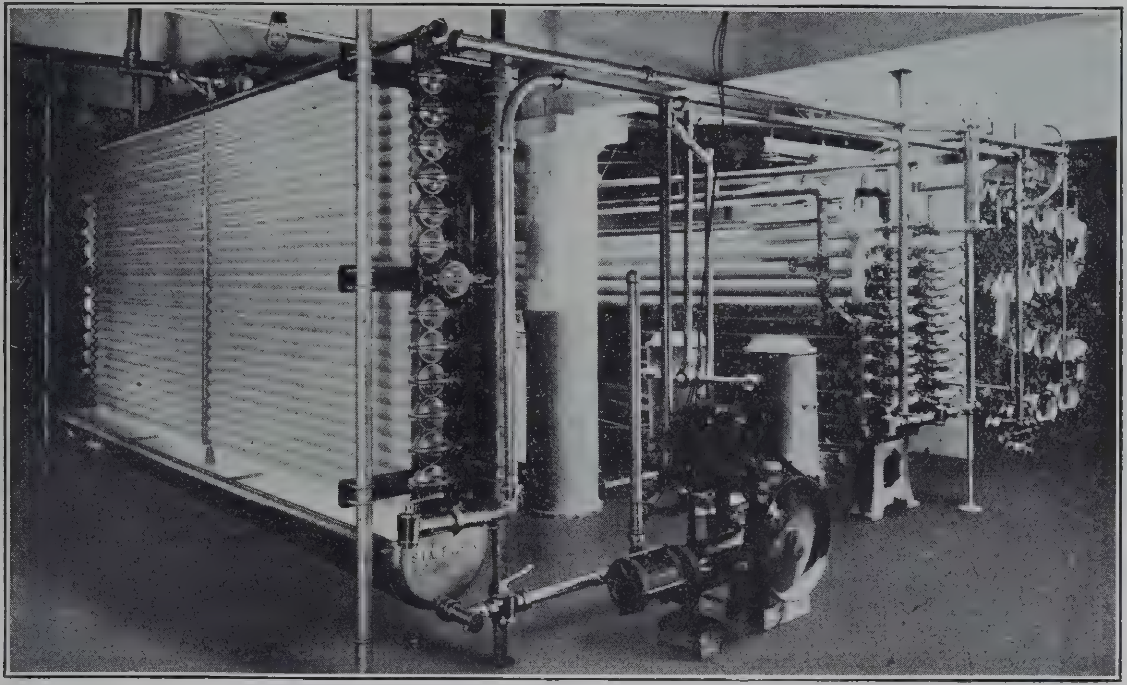
That the present quantitative method is not without its good points is brought out by Prof. Macy. "Taking into account the possible errors and adjusting conditions to eliminate them as far as possible, the results obtained in any one laboratory should be reasonably helpful in a diagnosis or prognosis for the immediate situation. I can see great value in our ordinary plate method when we are familiar with the accompanying and influencing factors in the present and past history of the sample. But when it is necessary to go blindly into an analysis of a sample without information as to its history, the method yields results which are decidedly questionable in value. Knowing the wide variations in technique and materials used in the standard plate method in laboratories in the same or different localities or in the hands of the various technicians, it is doubtful if any method of quantitative bacteriological analysis can yield comparable results."

Health Authorities?

In the September issue of The Milk Dealer B. W. Hammer and G. L. A. Ruehle gave their opinions regarding the present method of determining milk standards, in reference to bacterial counts. In this article, H. Macy, M. J. Prucha, E. G. Hastings and E. H. Parfitt give their opinions. All are practically in accord that while the present plate method leaves much to be desired—they point out that it is the most satisfactory at the present time. Seemingly the great trouble in the present method lies at the door of the health authorities in the various cities who are either ignorant of the limitations of the plate method, or do not wish to inform the public as to the real meaning and possibilities of bacterial counts.

Weakness in Health Departments.

No doubt, one of the greatest factors for the misunderstanding that exists concerning bacterial counts on the part of the laymen can be laid to the door of the health departments; for in many cases the type of men that are employed are certainly not doing anything toward clearing the ignorance of the consumer relative to the meaning of the bacterial counts. In many cases, those who have charge of the bacteriological analysis are men who do not have the training necessary for such work, and are employed solely because they will work for less money than one who has been educated in such work can afford to. There are cases of many cities that have employed men whose technical training in bacteriology has consisted of three or six months work in the dairy short courses who are totally incompetent to handle such work which requires greater skill and technical training than such men are capable of, if the work is to be carried on successfully. Certainly, it is no credit to the industry that allows such a condition to exist, when men with the training have to compete in salary against those of less training. Not only is it unfair to the trained bacteriologist who has spent years in acquiring such knowledge, but it is also detrimental to the



This Equipment saves $6000 a year in operating cost

There is probably no finer milk plant in Canada than that of J. J. Joubert, Ltd., of Montreal, which bottles over 100,000 quarts of milk a day, and which is known throughout Canada for the quality of its product. In this plant is installed a *complete* 14,000 lb. Burrell-Simplex Regenerative Continuous Long Flow Pasteurizer outfit, as shown in the illustration above.

Since installing this Burrell equipment, the Joubert plant has pasteurized at the rate of *14,000 lbs. of milk per hour,* with electric motors aggregating only 2 H. P., and with only one man required in the pasteurizing room! The saving in electric current, heating, refrigeration, and cooling water has been conservatively estimated at $6000 per year. And a decided improvement in the quality of the product has resulted from greater uniformity, better cream line, and lower bacteria counts.

The remarkable Surface Regenerator shown in the foreground of the illustration effects a tremendous saving in steam, cooling water, and refrigeration—and reduces coal consumption as much as 75%. The Burrell-Simplex Long Flow system holds the milk *positively* for not less than 30 minutes, nor over 35—with no loss of temperature during the holding period. There are no valves, elaborate timing devices or other mechanism—"nothing moves but the milk." And because of simple and inexpensive temperature control devices, the entire outfit can be operated automatically with part of one man's time.

These are only a few of the features that make the Burrell-Simplex Regenerative Continuous Long Flow Pasteurizer the most profitable outfit for you to use. Let us tell you about the other features—and the saving they will make in your own plant. Write today for illustrated catalog.

TRADE MARK REG. U. S. PAT. OFF.

BURRELL

SIMPLEX

Dairy Creamery Cheesery and Milk Plant Apparatus

This Mark Stands for Burrell Quality As Well As Interchangeability

The standardization of fittings as fostered by the International Association of Milk Dealers was a most timely step, and has contributed efficiency and economy to the dairy industry. It is an excellent thing. But it should be remembered always that this standardization means only standardization of dimensions—to permit complete interchangeability of fittings insofar as diameters, threads, etc., are concerned.

Now that there is standardization of dimensions, there is only one factor to determine your choice of fittings—*quality.* And in *quality* there is *no standardization.*

You will find that it pays to be *sure* you are getting *Burrell Quality*—Burrell character of metal, weight, workmanship, finish, style, durability—in every fitting you buy. The name "Burrell" is clearly stamped in a small circle on every genuine Burrell-Simplex Sanitary Fitting. This mark is a guarantee that you will receive not only the I.A.M.D. standardized dimensions, but also Burrell quality and precise correctness of Burrell workmanship. Always be sure that this Burrell trademark is on every sanitary fitting you buy.

A stock of 30,000 Burrell-Simplex Sanitary Fittings is constantly maintained to ensure the filling of your order within 24 hours of its receipt. At any time, you can order Burrell-Simplex Sanitary Fittings with the assurance that, first, your order will be filled *immediately;* second, your fittings will *fit;* third, your fittings will be of unsurpassed *quality.*

Catalog Section No. 293 gives detailed descriptions and illustrations of the individual Burrell Sanitary Fittings. Write for a copy today. There is no obligation.

milk industry, inasmuch as the trained man could give information to the public, whereas the untrained man is incapable of doing so.

Bacterial Count not Inflexible.

Prof. Macy brings this point out very clearly. "It appears to me," he writes, "that the disrepute which the method has attained is due principally to the lack of judgment on the part of those people who have attempted to interpret the results. There has been a tendency for many to consider a bacterial count as an invariable, inflexible figure, so exact, in fact, that a count of 55,000 would be considered much worse than one of 50,000. I have seen prosecutions on evidence of precisely this character when only single counts were the basis of indictment. As counts were considered as relative under the conditions of operation and judgment withheld until sufficient evidence were at hand to demonstrate a general tendency toward higher or lower counts, the method involved would not receive such ready condemnation."

In asking his opinion whether he considered the present plate method as valuable to the milk industry, or whether he considered other methods as being more satisfactory, Prof. Macy replied: "I believe that the standard plate method is useful, yes, even valuable in giving us data which could not be obtained otherwise. It should be retained, but in the interpretation of results we must not set up standards that are too arbitrary nor must we forget the limitations. Until we find some more adequate method we must continue in our present ways."

Methods Have Limitations.

Comparing methods to the generally used plate method, Prof. Macy continued: "With the Breed microscopic method, there are also limits of usefulness. When applied for milk suspected of high counts it is decidedly effective in picking out the classes of milk which are questionable. It combines to a certain extent a qualitative virtue with the quantitative determination for such high count milks.

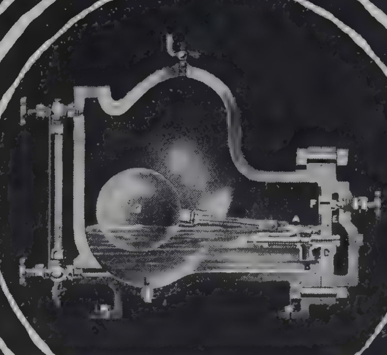
"The Frost 'little plate' method offers some advantages of both plate and microscopic analysis. Its use has not been sufficiently extensive to test its real merits. We have found it helpful but often experienced considerable difficulty among groups of men in obtaining results which were as comparable as results obtained when using the previously mentioned methods..

"The reductase test is quantitative and when the fermentation is allowed to continue sufficiently long becomes partly qualitative. Its usefulness is questioned. But again we must realize its handicaps and limitations.

"Other methods for the determination of the bacterial content of milk have been suggested, both quantitative and qualitative. But to date, I am not familiar with any method that does any more for us than the methods we now consider as standard. As long as we are dealing with biological phenomena we are confronted with countless variations and uncontrollable factors, particularly when we meet such complex flora as we do in milk. Each sample is different. It is questionable if we can ever get an infallible test or absolute uniformity in results. We shall find improvements, I am sure, and perhaps before the millenium someone of profound wisdom may give us our long-sought-for deliverance—a perfect method."

Wanted—Education for Health Authorities.

Seemingly, there is a unified opinion among many bacteriologists concerning the value of the present methods, and also the evils that have been allowed to creep in, for E. H. Parfitt of Purdue University holds the



Big Price Reduction

Due to simplified design and increased production, this large-capacity, continuous-flow trap is now sold at greatly reduced prices. While the American is slightly higher priced than some traps of the same **listed size,** it costs **less** if compared on the basis of **quantity of condensation handled.** For a smaller, lower-priced American will discharge as much condensation as most traps of a larger size.

The capacity of a trap is usually judged by the size of the outlet **pipe,** instead of by the size of the **discharge valve orifice.** In ordinary traps the orifice is very small compared to the size of the trap outlet; while in American Traps very large orifices are provided.

Another advantage of this construction is that dirt and scale pass through easily and will not clog the valve or cause chattering.

Other points of superiority which make the American a most economical and efficient trap are described in our Catalog S-25. Send for a copy.

AMERICAN STEAM TRAP

same opinions of Prof. Macy. Prof. Parfitt writes: "I think that the bacterial count as outlined by standard methods of milk analysis by the American Public Health Association has done much to improve the quality and increase the consumption of milk, but I am firmly convinced that many health authorities are not using the quantitative method of determining the bacterial content of milk in the correct manner. One must expect that the count is but approximately with a limit of error. I do not feel that one should not say that milk with a bacterial content of 15,000 is better than a bacterial content of 25,000, though I do feel that milk with a bacterial content of 15,000 is better than milk with a bacterial content of 150,000."

Prof. Parfitt brings up another point which, seemingly, is being carried to extremes in the milk industry. This is the evil of the galaxy of grades that exist with respect to milk, at the present time. Not only is this detrimental to the sale of milk from an ecomomical standpoint, but the psychological effect is bad on the consumers of milk; for immediately they gain the impression that those grades that are down on the scale are very poor from the health standpoint. In commenting on this, Prof. Parfitt wrote: "Our sanitarians have also brought about grades of milk in some cities. There are four or five different grades of milk, all palatable and all healthful; the grading having been done on the type of equipment used in the production of milk, and upon bacterial standard. This, I believe, is not fair to the industry inasmuch as the consumer cannot tell the difference in grade. I believe that Dr. Hastings of the University of Wisconsin, in his work on the methylene blue test, has somewhat neared a better system of grading milk than the bacterial count, inasmuch as he grades milk into classes, not numerical, but as good, fair, poor, bad. This is judged more or less from the period of time that it takes milk to sour."

Hastings Champions Bacterial Counts.

The author of the methylene blue test, E. G. Hastings, professor of agricultural bacteriology at the University of Wisconsin, whom Prof. Parfitt brings up in his opinions, is a strong champion of the quantitative test. In part, Dr. Hastings writes: "There is no question, I believe, concerning the value which such counts have been and still are in controlling and especially in improving the milk supply. So many phases of milk quality are directly related to the bacterial content of the milk as to make it necessary to use bacteriological counts if we wish to control the quality of the supply. I doubt very much whether at the present time one can wisely bring in the qualitative side in milk control work. It would greatly complicate the laboratory methods and make the routine examination of samples a rather difficult matter.

"It seems to me that everyone is interested in improving the milk supply. Milk with a low bacterial content will certainly keep better, taste better, and be more valuable for manufacturing purposes than milk of a high bacterial content. It will prove more satisfactory to everyone—to consumer, distributor, and producer. The only way by which we can learn whether an individual producer or distributor is so producing and handling milk as to have it of good quality is by determining its bacterial content. The quantitative aspect is, therefore, more important than the qualitative aspect. I should hesitate about introducing into control work the qualitative side at the present time."

Work for Milk Dealers.

M. J. Prucha, professor of dairy bacteriology at the University of Illinois, takes the stand that the present method of conducting quantitative counts is superior to the qualitative. In part, Prof. Prucha writes: "Judging from my personal experience of over 20 years and observations in general, my opinion is that the quantitative count is better than the qualitative count. However, I believe that the qualitative count would be better if it could be done. We have not advanced far enough in bacteriology to have any qualitative method which would be desirable and therefore, I believe, the quantitative method is better at present."

Seemingly, from the opinions gathered, there is but little hope for a change in the methods of determining the standard of milk. In the face of such conditions, the milk dealers have the work of educating the public regarding the meaning of the bacterial content of milk. Not only have they the mission of giving information to the consumers, but in many cases they will have to devise some means of contributing toward the knowledge of some of those who sail under the misnomer of "health authorities." Ignorance on the part of the consuming public is excusable, but not so with the latter, for if they are not alive to the meaning of bacterial counts they are obtaining money under false pretenses --in a somewhat different manner than the orthodox procedure.

⁂

INDIANA MAN BUILDS NEW PLANT.

A new concern, the West End Creamery Co., recently began operations in its new modern plant at 908 West Spring St., New Castle, Ind. W. E. Morris, who has had considerable experience in the creamery and dairy industry, decided to enter into business for himself and erected the fine, modern plant and reports he is enjoying a splendid business. The plant is said to be one of the most up-to-date small plants in the state.

With every kind of equipment for proper pasteurizing and clarifying of milk, Mr. Morris is able to offer pure, sanitary milk and cream to his already growing trade.

His fine new machinery includes a splendid pasteurizer, separator, cooling plant, testing machine, bottling machine, bottling apparatus, and bottle washer, as well as a splendid refrigerator, that will accommodate a total of about 400 gallons of milk and cream and many gallons of ice cream.

Mr. Morris plans to start making ice cream later. He has his machinery for this work installed at present.

Truck service is offered to all parts of the city.

⁂

MODERN EQUIPPED PLANT IN OPERATION.

Operations were recently begun by the Huron Dairy Products Co. in its new brick plant on East Third St., Huron, S. D. New fixtures and machinery have been installed and the plant is said to be thoroughly modern in every detail. The plant is electrically refrigerated.

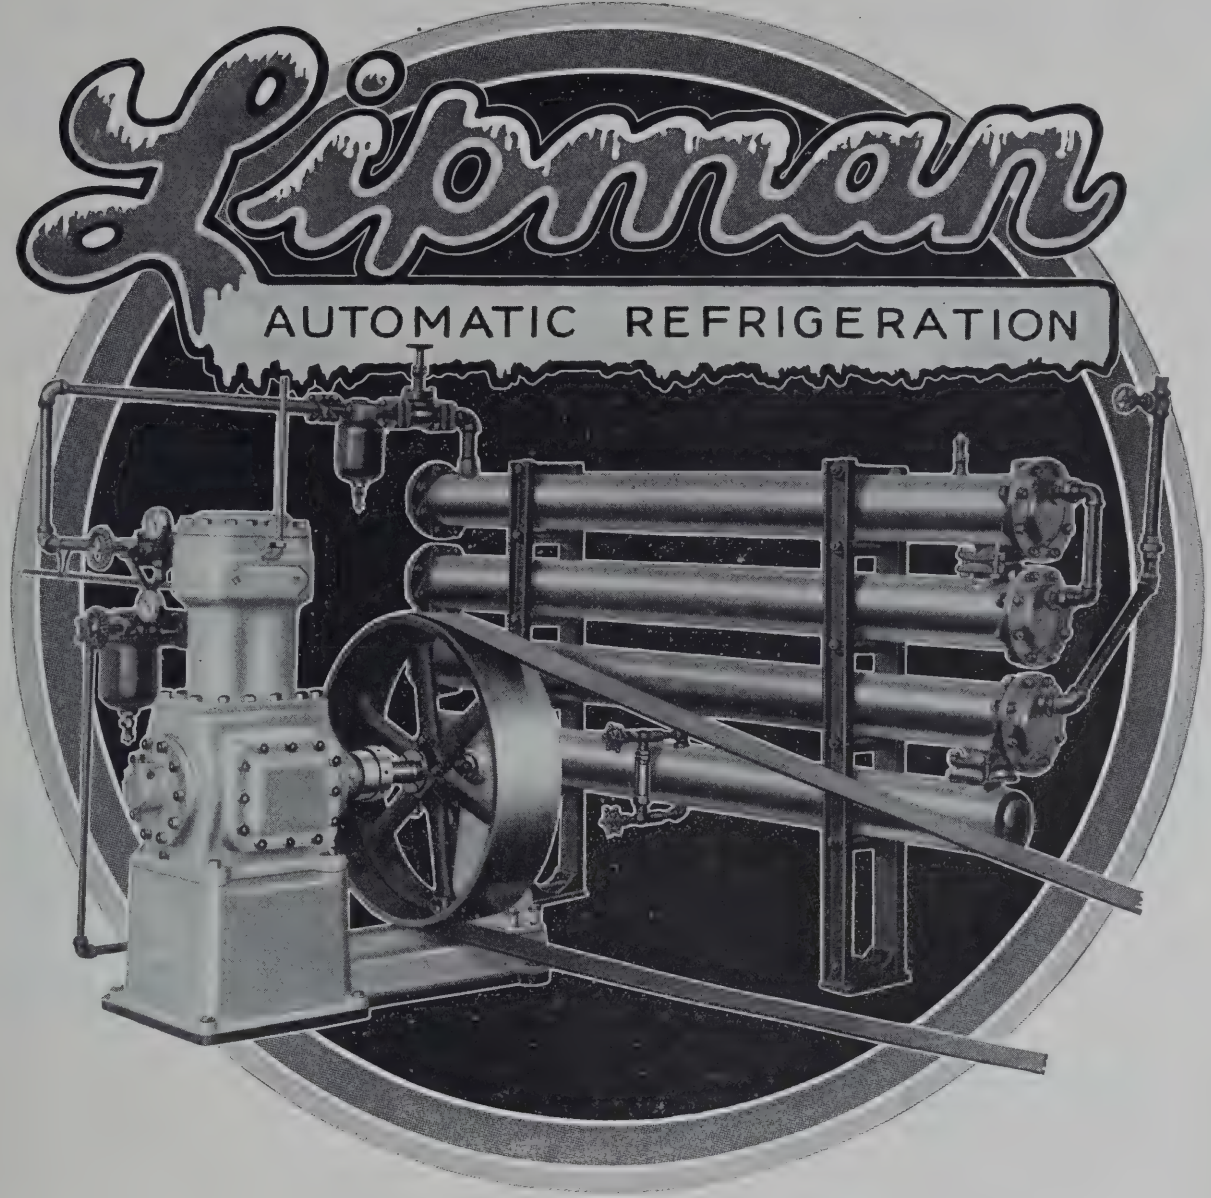
A new 600-gallon motor driven milk pasteurizer has been installed, where the milk is heated to 145 degrees F. From this vat it is carried by sanitary piping to a tubular cooler where it is aerated and cooled to 35 degrees. At this temperature the milk is bottled and capped automatically.

All milk bottles and cans are washed with live steam, the water from which the steam is made having been previously softened by machinery. The pressure washer runs from a centrifugal pump.

A new sweet cream pasteurizer is in the plant and will soon be put in operation, according to K. Greenquist, manager of the company.

A large new brine storage tank has been added.

Other machinery and equipment have been installed so that the plant is entirely sanitary.



Why You Should Consider Lipman

By virtue of built-in performance Lipman Full-Automatic Refrigerating Machines give lasting, continuous service. Extra good materials, really skilled workmanship, more than average careful inspection turn out Lipman Machines that operate dependably, very economically, and very steadily.

You can count on Lipman steady service. No attention needed except an occasional oiling. No time out for repairs. Lipmans are ideal for bottlers where day-by-day, year-after-year service is the only kind of service worth having.

THE DRY, CONSTANT COLD OF THE MOUNTAIN TOP

How Does Iowa Do It?

Iowa, Seemingly, Has Co-ordination Lacking in Dairy Industries

By ARNOLD ROSE

CO-ORDINATION is the crying need in the dairy industry. Few people realize it, many dispute it, and still more never heard the word. They are too busy attending to their own business, which is one of the great faults of what we are pleased to call the industry founded upon the dairy cow.

Many times the question has been asked, "What is the matter with the dairy industry?" The answer is quite simple—too many people attending to their own business. Not enough people know something of the other man's business as well as their own.

We have a much abused word in industry—a much misapplied word. We call it co-operation, though heaven only knows who ever misfired by putting such a word in circulation in trade channels.

Let it be understood at the beginning that this writer is not in the dairy business. He knows very little about it, virtually nothing. Then there is no argument here, for as a gentleman said to the angry bellboy after tipping him a dime, "Why discuss trifles?" But let it be impressed that this writer's connection with the dairy industry is limited to a few pop calls in various offices of dairy manufacturers in his daily pursuit of a competence at writing on various trade topics, from pickles to pins. And this writer is not quite popular, for he doesn't altogether mind his own business, having very little business to mind. After this article sees the pitiless light of day, it is likely that he will be still more unpopular.

Lack of Understanding.

What is the situation in the dairy industry? How is this industry going to work together if we don't know more about each other? You will understand that this, although a well-chopped up industry, really is one clearly defined industry, ranging all the way from the man who milks the cow to the man who makes butter, cheese, ice cream, condensed milk, evaporated milk, powdered milk, and so on.

But in certain of the states which we are pleased to call our leading dairy states there is quite a bit of uncertain flitting and flickering among the various dairying groups. As a result the dairy industry in those states is not the solid, substantial, prosperous system that it appears on the surface.

Iowa is a typical example—by exception. The dairy groups in that state are well organized. But even that may not fully answer the question of why is it that Iowa is running away with the butter prizes at the dairy shows, annually gaining over other states in better cows, consistently forging to the front in the manufacture—and sale—of ice cream? Yes, why? Hanged if I know.

But of this one thing is certain. You won't hang around Iowa dairy plants long until you discover this one fact—there is cohesion, organization. The dairy groups work together. Their industry is balanced. There is no pulling away, with market milk men holding aloof, ice cream men standing aside and talking about a free and independent industry, with cheesemakers hunting their holes and staying put. You will see that these men, somewhere in their workings, come into definite touch with each other, finally being welded at some great fountain-head of control. I don't know what the fountain-head is, but it seems that the educators of the state, the dairy officials and the public-spirited men of Iowa have a better and more guiding hand upon the checkreins of dairy control in Iowa than elsewhere. They are working for a quality product, and they are not stopping there. They are pushing lines of merchandising endeavor.

Through the Eyes of an Outsider.

Frankly, I don't know just how it is being done, but the fact remains that Iowa is going somewhere in the dairy industry and all the king's horses can't stop her. Some day, I promise you, I shall find out the whys and wherefores, for that is another story.

I attended a dairy meeting in a very large city one day—not an Iowa city. It would be extremely hard to class these people as dairymen. You might imagine that every one of them were strangers. It developed that it was a mixed organization, with creamerymen, milk dealers, ice cream manufacturers, cheesemakers, powdered milk manufacturers, etc., all participating. I have often wondered what developed at that meeting. Babel was quite a simple bedtime story compared to the bedlam of noises and counter noises and motions and counter motions at that meeting. But nobody spoke the same language. Nobody understood the other man's viewpoint. One man had his mind very seriously upon the manufacture of cheese, and an ice cream manufacturer was wondering just who the devil was out trying to cop some of his dealers while he was tied up, and a milk man was looking around wondering just why one of his competitors wasn't there, or what did he have up his sleeve? At least, that is the way it looked to me, for I was an outsider with nothing at stake except a healthy appetite for commercial copy.

"Certainly seems to be all confusion," this writer chanced to remark to a visiting supplyman.

But he grinned and shook his head. "Everything is down to normal. If this gang ever got anywhere with anything, I'd—aw, hell, then I **would** be worried."

But then, one naturally inquires of oneself, how the dickens is the dairy industry as an industry going to get very far ahead if these horses don't work together in this team? That thought still exists. It is not pessimism. There is no attempt to show that dairying is headed for the bow-wows.

Read Trade Journals.

It isn't that dairy manufacturers of one group are not interested in the other. However much an ice cream man may draw himself up and say, "Well, my business is separate, an entirely independent line of business," you will find this same ice cream man carefully watching butter reports, cream prices, cattle importations, etc.

In fact, you will see him reading with much interest everything about other dairy groups that he may find in his magazine, though the mistake in the past, too often, has been he has had to read too many magazines to keep up with everything that concerns his business.

You may hear a manufacturer say, "Aw, dern the trade journals, I haven't time to keep up with them." But the real trouble is he has had to read too many of them. Look on his desk and see the large number of

trade publications. How in the Sam Hill do you expect him to read all of those magazines and still attend to his business, if any?

The thing that is going to bring the trades of dairydom together is—more trade literature that will keep members of the industry better informed upon the various ramifications of dairy manufacturing and wholesaling.

The man who imagines that all he has to do is push one feature of his business is lost. You will hear one man say, "All we must do to sell more dairy products is to push merchandise—that's all, push merchandise."

Yet, that man is facing just one of the things to be done—a very important thing, indeed, but just one phase of the matter nevertheless. This also applies to the man who thinks that the problem of the dairy manufacturer is merely a manufacturing problem, merely a mechanical problem. He is facing just one side of the matter and has no protection against a flank movement.

The Need of Balance.

An industry that goes forward is like an army that wins or a successful football team or a successful farmer—it is a balanced industry. Business men need more balance. It is not good wisdom to shoot in one direction and forget about the other ramifications of the business. It is bad business for a man to allow himself to believe that he must just read the literature that has to do with a certain phase of his certain business.

Now, we have the ice cream manufacturer who thinks he is not interested in any other phase of the industry—not interested in the creameryman, the dairy producer, or the manufactured-milk man.

I haven't fully answered the question of how Iowa does it, but if you will take a trip through that state you will see many, many copies of The Ice Cream Review, The Milk Dealer and the Butter, Cheese & Egg Journal. But why should an ice cream manufacturer be interested in the Butter, Cheese & Egg Journal? I asked one that, and he gratified me very much by the reply, "I couldn't conscientiously look any man in the eye and tell him that I know my business if I did not keep up with the activities of the men identified with my industry."

There were no wrappers on these magazines.

⁂

THE SHOP POET GETS AN INSPIRATION.

In a recent issue of The Milk Dealer we published "Eleven Advantages of Drinking Milk in Factories," by M. O. Maughan, secretary of the National Dairy Council. The Pfaudler folks posted the page on their bulletin board in the big factory in Rochester, N. Y. The shop poet got his eyes on its with the following result:

Men Drinking in Factories.

Milk drinking in factories is a habit, if you please,
That helps each one who drinks it, do his work with greater ease.
It increases vital stamina where muscles are in play,
And makes a workman regular, and therefore earn more pay.
He does his work more accurate—efficiently withal,
And when a job needs extra vim—he has it at his call.
For building up the body, this liquid can't be beat;
And he who drinks a quart each day feels good from head to feet.
As an antidote 'gainst poisons which in the system lodge,
There is no other thing like milk to put them on the dodge.
To steady nerves and make you feel still fit when ends the day,
Drink milk! and be fatigueless when it comes your hour to play!

J. P. M.

SUPERIOR, WISCONSIN, HAS MODEL MILK AND ICE CREAM PLANT.

By Louise M. Maier.

Recently the Russell Creamery Company of Superior, Wis., completed the remodeling of their milk and ice cream plant, and the installation of new equipment.

The plant was open for public inspection September 17, 18, and 19, from 10 a. m. to 10 p. m. It is estimated that about ten thousand people toured this model plant during the three-day period.

Thousands of children not accompanied by parents were invited into the ice cream department where they were given liberal servings of Delisho ice cream in soft form. These children were constantly guarded by a police officer who was engaged for this purpose by the company.

Four thousand beautiful roses were given to the ladies who visited the plant. Everyone was given Delisho ice cream in the soft form. Five hundred gallons of ice cream were given away. Competent guides were on hand to guide the visitors through the plant and explain in detail the operation of each machine. The bottle cleaning process as provided by the patented mechanical cleaner was a revelation to all visitors as was the big mechanical can washer and all other equipment including the four ice cream freezers, the ice cream molds, ice equipment and the milk room and laboratory equipment.

The value of pasteurization was stressed during the time that the processing was carefully explained, in the beautiful milk room. Visitors were next taken to the laboratory where they were impressed with the need of laboratory examinations of their milk supply.

As they were about to leave, their attention was centered on the picture or chart purchased from the U. S. Department of Agriculture at Washington, D. C., entitled, "The Importance of Pasteurization." The visitors were then asked to register and were given literature, pertaining to milk and the necessity of proper pasteurization.

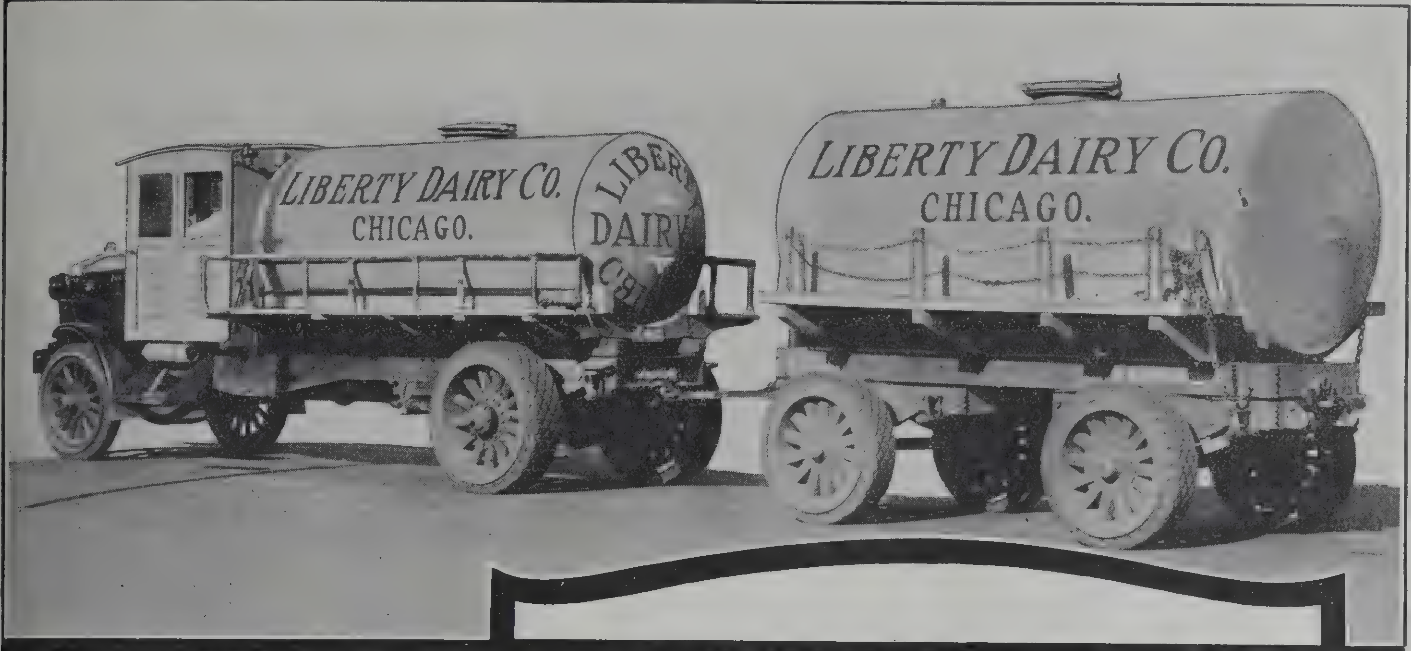
The Russell Creamery Company is managed by H. S. Russell, assisted by his brother F. N. Russell These two young men are to be congratulated for the progressive spirit and the confidence which they have displayed in their industry. It is such vision and spirit as theirs which is creating for our industry the big place which they have displayed in their industry. It is such vision and spirit as theirs which is creating for this industry the big place which it occupies in the world of commerce. Few people realize the efforts put forth by members of the industry for the protection of public health. The most people who visit our plants the more will realize our efforts and the greater will be our sales. The Russell Creamery will always be open for public inspection and will continue to arrange for group and individual tours of the model plant. Classes of school children will be taken through the plant during all school sessions.

⁂

DR. CAMPBELL RETURNS FROM EUROPEAN TRIP.

Dr. H. C. Campbell, director of the Dairy Laboratories, Philadelphia, recently returned from a summer's trip through the various European countries. While abroad he visited the veterinary schools in Germany, France and Scotland; also the Pasteur Institute at Paris, with the idea of noting what they are doing in milk hygiene, as well as general veterinary practice.

Dr. Campbell reports the United States far in advance over those countries in respect to our milk supply and in the development of our milk plants, etc.



2400 INSTEAD OF 1200 GALS.!

Journeys Thru *the* Highway Plant

No. I

Spring Dept.

The above is a glimpse of the Spring Department in the Highway plant. With the exception of bearings and tires, every part of Highway Trailers is made in the Highway plant.

The Highway embodies the quality construction at low cost which complete manufacturing facilities assure.

Just doubles the capacity, with one haul instead of two. That's what a Highway Tank Trailer does for the Liberty Dairy Co., Chicago, Ill.

The tank unit illustrated above is one of two in the service of this company. It makes a "run" of 100 miles daily, hauling 2400 gals. of fluid milk each trip.

Can you haul 2400 gals. of fluid milk on the back of any truck you know?—neither would your city or state permit you to use it! Nor would you want to make such a staggering investment in one truck!

No other equipment equals a truck-trailer system for economy of first cost and operation, not one! Fewer trips, maximum loads, truck capacity doubled, —that's Highway Trailers.

The Trailer pictured above is one of the most popular models; others in two and four wheel models with tank, refrigerator or special bodies are available.

Milk Bottle Exchange Pays Big Dividends

Rockford, Illinois, Health Department Conducts Survey and Makes an Interesting Report

By N. O. GUNDERSON, M. D., and R. W. GENRICH*

ONE of the most complex and perplexing problems confronting the milk dealers of the country is the inability to have all milk bottles used in the distribution of milk returned to the rightful owner. For years, it has been the custom for each dealer to make use of any and all bottles that were returned by the drivers, with the result that dealers having the largest number of bottles in circulation were forced to buy new ones more frequently than necessary. Then too, many junk dealers were collecting bottles because a fertile field existed for their sale outside the jurisdiction of the local dealer.

When one considers that about five milk bottles must be kept in circulation for every customer the significance of this problem becomes very evident from an economical viewpoint.

For years, this problem has been lying dormant for lack of solution in spite of the fact that an Illinois law forbids a dealer to use bottles other than those bearing his own name.

Repeatedly the local dealers have appealed to municipal and state authorities for help, which has not been forthcoming, due to a lack of sufficient field men, who could constantly supervise and control all dealers and public in general.

A few dealers on several occasions have united in the hopes of solving this problem, but with no lasting results because of lack of co-operation on the part of all the dealers.

Investigation of dairy literature also shows that several large cities support organizations for the control of this problem and a brief description of the Rockford system may be of interest to dairies or cities contemplating a similar project.

Rockford Survey.

With the above data in mind, a comprehensive survey and study was made of the Rockford Milk Dealers Bottle Exchange by the director of the health department bureau of milk control, in order that a permanent record may be available of this city's method of handling the ever-present bottle problem.

Description of City.

Rockford, a thriving manufacturing city of 77,000 population, is located in one of the richest dairy sections of Illinois and consumes approximately 56,000 quarts of milk daily. If five bottles must be kept in circulation for every quart of milk delivered to the customer's doorstep, the dealers of Rockford must have approximately 280,000 bottles on hand at all times, which represents a total investment of $15,400.

Bottle Exchange Inaugurated.

Realizing and appreciating the enormity of this economic problem a bottle exchange was established in Rockford whose purpose is to accomplish the following results:

1. Prevent dealers from using only those bottles, cans and cases which bear their own name or stamp.
2. To afford a means of collecting stray bottles, cans and cases.
3. To instigate a system of inspection of all these containers at each dairy once a week.
4. To afford a means of transporting foreign bottles, cans and cases to the rightful owner.
5. To educate the public to respect the milk bottle and use same solely and only for the purpose of transporting milk.

All these conditions being in strict accordance with state law, local dealers could not well afford to stay out of the organization.

Local Organization.

Investigation shows that the first exchange in Rockford was established three years ago, by two of the largest dealers, and while unsuccessful for a time, the exchange today includes all local dealers, which was made possible only after a long, painstaking program of education.

At the present time, the local exchange consists of an unincorporated company owned and operated by fourteen dealers, who elect three officers annually with

John W. Ladd Co.

COMPLETE OUTFITTERS TO THE DAIRY INDUSTRIES

Detroit · Columbus · Cleveland · Cincinnati no salary attached. These officers in turn engage a manager and an assistant, both of whom are salaried.

Equipment.

A rented shed thirty by thirty constitutes the building equipment for the exchange, where all bottles, cans and cases are sorted and stored until delivered to the rightful owner. No unwashed bottles are permitted in the exchange because of odor, and secondly, bottles with dried milk must be hand washed.

Operation.

The two exchange operators carry on bi-weekly inspections at all dairies at which time all bottles, cans and cases are inspected immediately after washing. After the day's run is completed a count is made of all foreign bottles and the inspected dairy is given a receipt for all foreign bottles, cans and cases. The price paid the inspected dairy is one-half cent for each bottle and nothing for each can and case, after which they are taken to the exchange shed.

Then, once a month the exchange delivers all containers to the rightful owner, who must reimburse the exchange at the following prices: Milk bottles two cents, cans ten cents and cases ten cents. In other words, with exchange bottles on hand a dealer pays one and one-half cents for bottles, ten cents for cans and ten cents for cases, which is quite a saving over the market price of five and one-half cents per bottle, fifty cents and one dollar and seventy-five cents respectively.

Personnel Expense.

An interesting feature of the Rockford exchange not found in other cities is the unique method of financing the personnel of two people. The exchange value or income from returned containers is not sufficient to support the operators, and to overcome this the dealers have arranged to give the two operators a hauling route for collecting milk, which does not interfere and brings each man to the dairies in time to make their inspections.

Volume of Business.

Records of the exchange manager show that during the year 1925, over 90,000 milk bottles were returned to the rightful owners at a cost of $1,350.00 to the local milk dealers compared to a cost of $4,950.00, if these same bottles were purchased on the open market. No records were obtainable, however, on cans and cases.

Bottle Exchange Accomplishments.

The accomplishments of the Rockford Milk Bottle Exchange may perhaps be summed up as follows:

1. The exchange is a means of educating local milk dealers not to use foreign bottles.

2. Records show that a large number of bottles are being returned to the rightful owners, but no records are available as to cans and cases.

3. The financial records of the exchange show that this organization is an economic saving to the dealers.

4. An exchange is one means of effectively complying with the state dairy law which forbids a dealer to use only those bottles, cans and cases bearing the dealer's own name or stamp.

5. That the exchange has apparently curbed the buying and selling of milk containers by junk dealers.

Conclusions.

1. That the Rockford Milk Bottle Exchange during the last two years has proven to be a financial success.

2. That an average of 90,000 milk bottles were returned to the rightful owners during the year 1925.

3. That this represents a saving of over $3,000.00 to the dealers compared to an operating expense of less than half this amount.

4. That an exchange acts as a powerful stimulus to all local dealers to use none but their own bottles.

5. That the exchange proves conclusively that the state dairy law regarding the use of foreign bottles cannot be effectively enforced by official inspectors and therefore serves only as a weapon in the hands of the exchange managers in effectively carrying out such projects.

6. That the exchange is unique in that the proceeds do not warrant the salaries of the two men, but by employing milk haulers as exchange operators a very effective economical organization can be perfected.

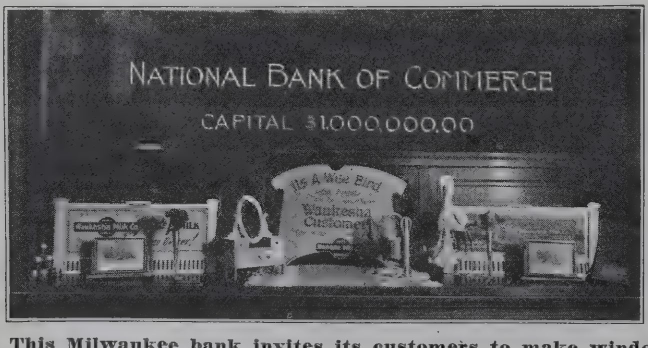
7. That investigation shows that the exchange can be made a success in small cities as well if a co-operative plan of using milk haulers can be worked out.

8. That equipment necessary for conducting an exchange is very limited and that the overhead expense is very small.

9. That the dairies of Rockford are to be commended for having instigated an exchange.

10. That the exchange thus far has not worked out any effective plan for collecting stray bottles from factories, homes and especially buildings under construction.

11. That the exchange officers have an opportunity to put forth an effective educational program along the lines of, "Remember the Milk Bottle and Keep it Free from Contamination" and popularize the slogan, "Mr. Customer, when you buy a bottle of milk, the milk belongs to you, but the bottle is the personal, private property of the milk dealer."



This Milwaukee bank invites its customers to make window displays, using the bank's windows on a busy street corner for the purpose. The Waukesha Milk Company took advantage of the opportunity.

MILK USED TO CURE INSANITY.

According to a report from Berlin, Germany, milk has been used to cure insanity but it gets in its beneficial effects on the patient's system through injections with the hypodermic needle rather than by the more usual route of the mouth, according to advices just received here.

Dr. Julius Schuster, formerly a member of the faculty at the University of Budapest and authority on psychic diseases, observed that many of the insane patients who lost weight, even down to the point of emaciation, decidedly improved in mental conditions. He accordingly resolved to try the effect of speeding up this process by the injection of foreign proteins into the system, in the form of milk. This procedure has been used with considerable success, it is said, in the treatment of certain infectious diseases but has seldom been tried with maladies not of infectious origin.

By carefully regulating the milk injections, six out of 16 of his patients were completely cured, Dr. Schuster declares. Several types of insanity were represented in the group, including dementia praecox, one of the most prevalent mental disordrs. The curative effect is explained as due to anaphylactic shock which influences reactions of the thyroid gland and the liver.

General American Milk Tank Cars come thru!

Disaster in Miami. An appeal to the nation for help. Doctors, nurses, clothing, food...and *milk*. Milk for babies, for exhausted men and women. Milk...Milk ...Milk...and Chicago responded.

A wire from Miami from Chicago's Health Commissioner, Dr. Herman N. Bundesen. Received in Chicago at 9 P. M. Wednesday, September 22nd. "Rush Milk." In 76 hours a General American Milk Tank Car with 50,000 pounds of Tuberculin Tested, Pasteurized Milk was delivered in Miami. Enroute only 54 hours from Janesville, Wisconsin. A record...a General American achievement, to meet an emergency.

The milk was donated by the Chicago Milk Distributors. Their contribution to a mighty good cause. Transportation was given, and speediest of cooperation by the Chicago, Milwaukee and St. Paul, Chicago and Northwestern, Pennsylvania, Southern, and Florida East Coast Railroads. Without their assistance the Milk Car supplied by General American could not have accomplished its mission.

Daily, the General American Car Company is performing an increasingly important service for the dairy industry and the public. And while the emergency Florida trip is highly significant in the transportation of perishable foods under diverse climatic conditions... it is nevertheless only a milestone in the greater service that can and will be delivered as General American builds more and more Refrigerator Milk Tank Cars.

Milk Plant Labor Studies

Effect of the Type of Plant on Number of Plant Employees Required

[*Milk Plant Letter No. 145, U. S. Bureau of Dairy Industry*]

THE number of men required to operate a milk plant seems to be affected to some extent at least by the type of plant. As a general rule, fewer men are required in plants located on one floor level than in those occupying several floor levels.

In the table below is shown the number of plant employees used at 92 plants arranged according to size and to the number of stories. The average total number of gallons of milk and cream handled per plant employee is also shown in the table. The total number of gallons of milk and cream handled per plant employee with the checkers excluded is also shown, since some dealers do not include the checkers as plant employees but charge them to the delivery or sales department.

It will be noted that with only two exceptions more milk and cream were handled per plant employee in the one-story plants than in the two-story plants and more in the two-story plants than in the plants of three or more stories. In group six of the plants of three or more stories more milk and cream were handled per man than in the same group of the two-story plants, though less was handled than in group six of the one-story plant. One of the reasons for the two-story plants in this group being lower than might be expected in number of gallons handled per man, thus presenting an exception to the general rule that two-story plants are more economical as to laber required than plants of more stories, seems to be that one of the plants in this group was a grade A plant with only 188 gallons of bottled milk and cream handled per plant employee, which brought down the average for the group considerably. The other exception to the general rule is in the case of the one plant of three or more stories in group four, at which more milk and cream are handled per man than in the same group of the two-story plants. While this plant was classed as a three-story plant, it was very well arranged and might have been put in the two-story class. The milk was pasteurized on the second floor and bottled on the first floor. The bottles were washed in the basement, but the bottle washer elevated the bottles to the first floor, where they were filled. Thus, while three floors were used, this plant, by its well arranged conveyor systems, obtained practically the same efficiency as a one or two-story plant.

From the survey that was made it seems apparent that best results as to labor required are obtained where the bottle washing and filling departments and the milk storage are on the ground floor. In this way there is a minimum of handling and of supervision required. Where the bottles are washed in the basement and the bottle washer delivers the bottles to the fillers on the ground floor nearly as good results are accomplished.

⁂

THAT'S A FINE COMPLIMENT, JOHN.

In a recent review of American business methods, the "London Observer" made this significant comment: "Our investigation showed plainly that America's prosperity was due not so much to her natural advantages as to the enlightened policy of her citizens in developing them."

Fluid Milk Market Report for United States for Sept., 1926

By Bureau of Agricultural Economics, Market News Service, United States Department of Agriculture.

Table I—Producers' Prices for Standard Grade Milk Testing 3.5% Butterfat, Delivered F. O. B. Local Shipping Point or Country Plant.

Prices which appear in this report are secured through the co-operaton of milk distributors, producers' associations and municipal officers. Dealers' buying prices unless otherwise indicated, represent prices applying to all milk delivered by producers. For cities where a "surplus plan" is in effect, the prices reported in table III are for "basic" quantities. All per cwt. buying prices have been converted to a 3.5% butterfat basis for comparative purposes.

Sections	Range of Sept. Prices		Prices Compared for Same Markets			
	Number Local Markets	Prices per Hundredweight	Number Local Markets	1926 Average for Sept.	1926 Average for August	1925 Average for Sept.
New England	8	$2.95–$3.82	8	$3.43	$3.38	$3.44
Middle Atlantic	15	2.00– 3.15	15	2.70	2.62	2.69

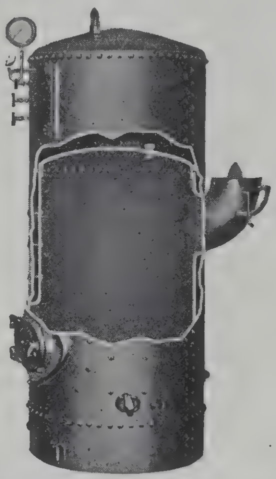
The Famous Flueless — Boiler —

Famous as a Quick Steam Producer.
Famous as a Fuel and Repair Economizer.

BOILER is regularly constructed with extension to form ash pit, but can be furnished with cast iron base, in all sizes up to and including 48 in. diameter, **without extra charge.** Boiler comes complete with fire door and frame, ash door, grates, elbow and damper, hand hole plates complete. Steam trimmings include safety valve, steam gauge and syphon, water gauge, gauge cocks, blow-off valve, injector complete with check and feed valve. All constructed to comply with the A. S. M. E. code for 100 lbs. working pressure and tested to 150 lbs. hydrostatic pressure.

Boilers carried in stock at all times.



See your nearest jobber for further particulars.

WHAT IS THE LIMIT FOR STEAM PLANTS?

Drs. Mellanby and Kerr of Glasgow have published some interesting figures in the British journal, Engineering, on the possible future performance of steam plants. They conclude that 1,250 pounds per square inch will eventually be the best pressure. Feed water will be heated to 545 degrees F. The maximum temperature of the steam will be 900 degrees F. With a vacuum at 29 inches, and an economizer and boiler efficiency of 90 per cent, assuming that the auxiliaries will consume 3 per cent, their result is 9,875 B.t.u. per kilowatt-hour. This is equivalent to 0.544 pounds of coal per horse-power-hour, on the basis of 13,500 B.t.u. per pound of coal.

Just how a temperature of 900 degrees F. can be safely carried is not explained with sufficient clearness for me to comprehend. But they claim that 900 degrees F. is possible even with modern materials. Most engineers consider 700 degrees F. as the safe limit under present day conditions. In some places 750 degrees is actually being used. After 750 degrees is reached the ultimate strength of steel decreases very rapidly and the elastic limit has decreased about 33⅓ per cent. However, it may be the Drs. Mellanby and Kerr are right as they apparently have done a great deal of experimenting. There is still much to be known about power plant performance under high pressures and temperatures.—W. F. Schaphorst.

A MAN'S WORD.

What is there to this subject of verbal promises in business?

Is a milk dealer under fundamental obligation to keep verbal promises? Is, as a proverb says, "a bad promise better broken than kept?" Some milk dealers have an enviable reputation for keeping their word. Are they more fortunate individuals than others, are they inherently more honest, or what?

Writers of commercial law repeatedly advise business men to reduce all contracts to writing. This is excellent advice, so far as it is practicable, but every commercial business man knows it is impossible to reduce all agreements to writing. Obviously, before a contract can be executed, there must be an agreement to put it in writing. That "meeting of the minds" cannot, in the first place, be put in writing, obviously.

And there are a host of petty agreements, very small affairs, to dignify which with written contracts would make ridiculous the contracting parties.

Confidence is an absolute credential in business. Business men must repeatedly put it in each other, and in most cases this means trust in another's verbal promise.

We believe one policy conducive to kept promises and a high business reputation has been largely overlooked in current literature. That is due care in making promises. The best business man makes promises only as his judgment tells he can live up to them, and that he will be glad to do so. He makes his promises with good judgment, with proper precaution. The logical result is that he can, without inconvenience, keep promises. He does not find himself in situations compelling him to break his word.

A great many light and unnecessary promises are made by men in business. Promising gets to be a bad habit. The victim—for that word is absolutely appropriate—habitualy feels no obligation to fulfillment, and thoughtlessly promises this, promises that, in many cases where it is not necessary to promise or where the impossibility of keeping the promise is apparent as he makes it.

Make promises with caution, looking ahead. Promise only those things you believe you will be glad to fulfill, as you also will be able to fulfill.

Keeping the verbal promise pays as a practice of cold business. Leaving the question of ethics out, every milk dealer should plan to develop through the years a flawless reputation for keeping his personal word. Promises well made are easily kept.

During the Baby Week Council in London, the United Dairies Limited invited the members to attend their Streatham plant. The two gentlemen in the foreground will be recognized by their friends as Messrs. P. B. Tustin and E. A. Evans, who are known to many in this country.

LABORATORY STANDARDIZATION.

There are few localities in which laboratories for milk-control work are not available. Most boards of health in the larger cities maintain such laboratories. These are usually well equipped, and the work is done by a trained personnel. When the size of a milk plant warrants it, a private laboratory is usually organized for the benefit of that particular plant. In addition, many private laboratories are available for the use of the dairy industry.

It happens frequently when these various laboratories are in the same locality that dissatisfaction and misunderstandings arise because of the fact that reports submitted by the different ones upon the same lots of milk vary to a wide degree. This is especially true with reports upon the bacteria count of milk samples. Such a condition may be greatly relieved by co-operation among the various laboratories in standardizing the methods, equipment, and material used in this work.

Great variations in bacteria count are due in part to improper sampling; to differences in the materials, methods and equipment; and to the personal element entering into the counting of the plates.

Obviously, proper sampling is necessary if comparable results are to be obtained by various laboratories upon the same lot of milk. Care should be taken to obtain as nearly identical samples as possible when two or more laboratories are working upon the same milk. The temperature and age of these similar samples should be the same until the samples are plated.

Variations in the composition of the ingredients in the media will cause pronounced variations in the total bacteria count of identical samples. All media used should be of as nearly the same composition as possible. Such a condition may be brought about by using the same brand (and lot) of ingredients and by adjusting the acidity of the media to the same standard.

Standardization of equipment, sterilization, and plating may be easily accomplished without undue effort. Such steps are essential if the bacteria counts obtained by various laboratories are to be compared. The time and temperature for incubation of plates have been standardized. However, such factors should be carefully controlled.

Without adequate instruction and training, two persons will seldom count the same plate in the same manner. In the case of high dilution especially, this error in counting may become serious. Efforts might well be made to overcome this.

The slightest difference in equipment, materials, or methods used may influence to a marked degree the reported bacteria count of the sample. With these facts in mind it is easily understood why two or more laboratories may report quite different results for the same lot of milk. In order to lessen any misunderstandings which may be caused by the nonagreement of reported bacteria counts, it is suggested that various laboratories coming in contact with one another carefully standardize their entire laboratory work as regards bacteriological analysis of milk. Such a movement, if successfully carried out, would react most favorably to all concerned.

The fifteenth annual meeting of the International Association of Dairy and Milk Inspectors will be held at Philadelphia, Pa., October 25-27, 1926. A program has been planned which will be of interest and value to milk inspectors.—Milk Inspector Letter, U. S. Bureau of Dairy Industry.

BOSTON

Know

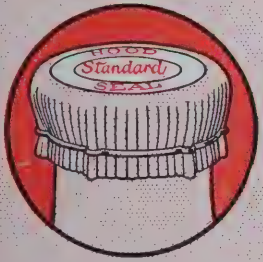
They know all about all of the different ways of sealing milk bottles.

They all have adopted Standard Hood Seals because they must have a non-replaceable seal, because they must have a seal that will stay on the bottle thru delivery no matter how roughly handled.

These leading dairies have adopted Standard Hood Seal only because it does a better job and for the same reason their patrons prefer them.

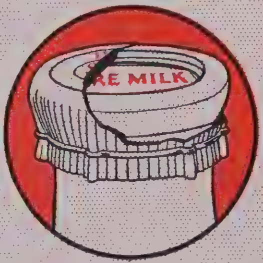
You can safely rely upon the judgement and experience of these world-leading distributors.

Their experience and preference should settle the sealing problem for every dairyman who is at all interested in what is best—what the leaders are using.



HOOD
Standard
SEAL

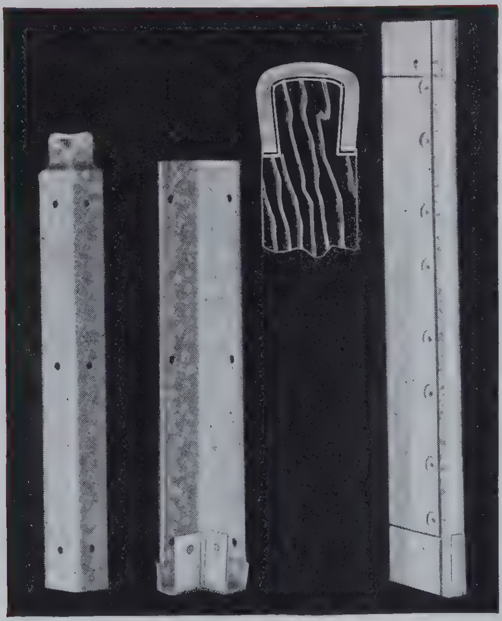
A metal sealing ring, locked on the hood at the time of bottling provides a non-replaceable seal which positively prevents tampering.



The hood goes on over the inner disc, covering the pouring lip, making a double seal. The inner disc cap is a necessary feature of any proper closure for milk because its clean, sterile surface comes in direct contact with the milk.

HOOD SEAL

TRIED and



Better Construction with Fewer Parts

Proved

by RE-ORDERS and the past record of buyers for their conservatism and discrimination.

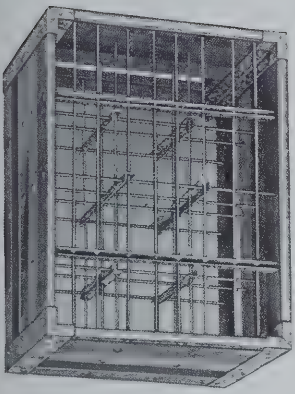
Showing the single piece stacking iron and inside corner support and how the outside corner folds under and locks on the inside giving full protection of the bottom corner from the stacking iron below. The bottom runner also gives complete protection for a full half inch up the inside and outside of the slat. The lower slat is dovetail in shape on the bottom and the runner slides over making a snug fit that won't come off. This avoids the use of any other means of fastening it that might loosen and impede the progress of the case over conveyors, slides or wagon boxes. The fold in corners of the outside corner iron make a smooth finish and absolutely prevent the runner from loosening. The slats are also rabitted near the ends to take a right angled fold of the outside corner iron. This prevents the cases from "weaving" when stacked high.

Every feature of design, construction and selection of material has but a single purpose

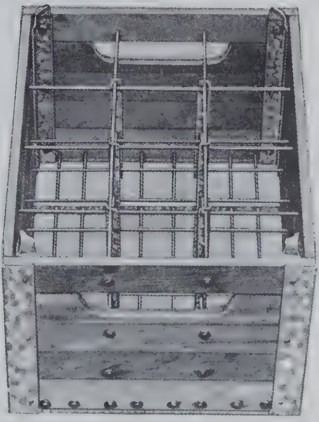
"years of steady service"

G. H. TENNANT CO.,

FOUND RIGHT



Armor Klad Bottle Cases



Made in many styles, yet all standard in size to facilitate stacking and avoid lost storage space. All cases come with metal bottom runner as "regular equipment." The dividing wires are well supported by channel irons on the bottom and the uprights provide extra stiffening and prevent shift of the wires.

Put the Grease Where the Squeak Is for the Best Results

DO YOU believe in oiling your entire automobile when a squeak develops in a certain spot? Or do you believe in locating the squeak and oiling only it, thus saving oil that would, in the other case, be needlessly wasted? Something of the same theory and practice can profitably be practiced by milk dealers who are attempting to increase and build their business through the assistance of employment of advertising.

Trained surveyors, during the past few years, have conducted surveys to ascertain the facts as to why women in their homes buy any milk at all, and why they buy a certain kind or brand or from a particular firm. Would it not be interesting and valuable to you if you could know what the **buying motives** of the women in your city are? If you knew these, you could accurately check up with your selling arguments. Why does this woman buy milk from you? And why does another buy from your competitor? We know that the shrewd sales manager succeeds in direct proportion to his accuracy in gauging the buying motives of his customers and prospective customers.

The surveys which have been completed have investigated the reasons women have for changing dairies, as well as ascertaining the comparative importance of service, driver, quality of milk products, etc. It is usually an "eye opener" when the reasons the housewife changes dairies and brands of milk is found.

Advertising should tell facts, and facts should be sold. If this is the case, then a disinterested survey is the thing that will bring to light the important phases of the situation, enabling the dairy company to secure definite and profitable results from the knowledge they have gained. First, the surveyor must gain the housewife's confidence for, without this, his results will not be true, his information will be "colored," and his time spent for naught. He does not get the facts.

For instance, to show how far astray some of the advertising which is being conducted is going, a recent survey for one of the largest dairies found an expenditure of many thousands of dollars being made for the purpose of counteracting advertising of a "competitor." The survey showed the facts. The "competitor" was not, in fact, at all a competitor and the money should have been spent on an educational campaign telling the truth and facts about the value of "fresh milk in bottles," what it will do for those who drink it, its healthfulness, its actual necessity in the diet of young and old. The consumption of fresh milk in the city in which this survey was conducted amounted to only one-half pint per capita and 60 per cent of the homes were using condensed milk.

Still, many dairies continue to go after these imaginary conditions when getting the facts before advertising would save the oil that is wasted in lubricating the entire machine for a single squeak. This is really the first step toward efficiency in advertising.

Each and every kind of advertising which a dairy may do has its own and important function. Newspapers do certain very definite things, and should be used for those things, rather than for the things they will not and cannot accomplish. The same holds equally true for billboards, direct, home-bound pieces of literature, wholesale displays and all other forms of advertising.

Buying motives are the dominating facts in the growth of any milk business and any campaign that does not start with the fact-finding survey wastes both time and money. One of the revealing, or "tell-tale" questions being asked, gives surprising results. Here is the question: Where have you seen fresh milk advertised? Another revealing question is: What do you remember about the advertising you have seen?

We are not going to stop advertising, but we are going to put dairy advertisers on a more definite basis and we plan to do certain, definite things that advertisers have a right to expect. We need more purpose and more facts in our advertising, whether the problem is the need of a spread of the truth about pasteurizing, or less milk agitation, or good will, or a better sample product.

Some of these surveys have demonstrated that the greatest, strongest competitors of a dairy were not the other dairies in the same city, but they have shown that the dairies have a common need and interest in a forward-looking program pushing milk and what milk will do. This can be "put-over" in a large program conducted by a united, consolidated effort and program by all dairies.

⁂

NEWS FROM FAR AND NEAR.

Atlantic City, N. J.—Supplee-Wills-Jones Co. has installed a very large type bottle washer in its shore plant.

Atlantic City, N. J.—Abbott's Alderney Dairy Co. now receives much of its seashore milk supply from central Pennsylvania. The milk is shipped in glass-lined tank railroad cars direct to Abbott's siding.

Delanco, N. J.—Joseph W. Kemble has discontinued pasteurizing and bottling milk, now receiving his supply from Borden Estate, Burlington, N. J.

Haddonfield, N. J.—Albert Munn has installed a mechanical refrigerating outfit in his pasteurizing plant.

Hoboken, N. J.—I. B. Rothstein and Mr. Neuschtat have taken control of the Vineland Products Cheese Co. on Clinton Street.

Lakewood, N. J.—Frazee Brothers have installed a batch pasteurizer in their milk depot.

Paterson, N. J.—Samuel Vermeulen has just installed a batch pasteurizer at his plant on Gillies Street, Clifton, N. J.

Riverside, N. J.—W. Joseph Cook has retired from the milk business, having sold his "good-will" to H. V. Bishop.

Weehawken, N. J.—Nathan Axelroad has given up the business of sour cream and cheese manufacturing.

Woodbury, N. J.—A. G. Cramer has installed several glass-lined vat pasteurizers to replace his old continuous-flow pasteurizer. Several other improvements have been made in his plant.

Michigan City, Ind.—The Triangle Dairy Co., with capital of $15,000, was recently incorporated with John Schmauz, Herman E. Leverenz and Samuel P. Boonstra.

Madison, Wis.—Mandt Dairy Co. was incorporated with $20,000 capital. Incorporators are L. O. Mandt, M. C. Mandt and W. R. Mandt.

Philadelphia, Pa.—Scott-Powell Dairies, Inc., is planning to erect for its Stenton Park branch a two-story and basement structure, 145 by 84 feet.

Fargo, N. D.—The Acme Dairy Co., 701 13th St., is building an addition to its plant.

Cambria, Wis.—The Cambria Dairy Products Mfg. Co., capital $12,000, was incorporated with Charles W. Wainke, Wm. R. Wainke and E. W. Buntrock. The firm will manufacture ice cream, cheese, butter, etc.

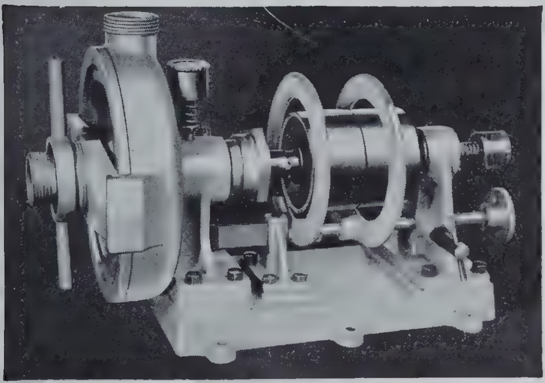
PUMPS

Protect Your Products

Because



This pump is made with a view of being absolutely sanitary. All surfaces coming in contact with the milk, being of bronze, tinned, finished smooth, and very accessible for cleaning.

Regardless of elevation or speed—"No Foam."

Constructed so that it will handle milk or cream with the least possible agitation.

Perfectly balanced—all parts completely machined.

Milk passes through the impeller housing, but the vanes do not pass through the milk, which prevents churning and injury to the cream line.

No foam because no air can enter the pump from shaft bearing, nor grease from the same source.

This pump is so constructed that there is pressure on the packing instead of suction.

No churning, because the enclosed impeller carries the milk to full peripheral speed without the vanes passing through the milk.

WHAT A LABORATORY DID FOR ONE MILK COMPANY.

(Continued from page 32)

after filtering, 40 per cent decreased, and 10 per cent remained the same.

The reduction in count due to pasteurization varied between 97.0 and 99.9 per cent, with an average reduction of 99.3 per cent each year. Pasteurization was practically as effective one year as in the next, but since the original count of the raw milk was higher in the first two years and with the per cent of reduction the same, the counts of the pasteurized milk would naturally be higher in 1923 than in 1924, and lower in 1925 than in 1924 or 1923.

Samples taken during the month of January, 1924, brought forth the fact that the percentage reduction was lower than during the summer months, even though the original count in the raw milk was much lower. The raw milk count averaged 1,200,000 with the limits between 250,000 and 5,000,000. The pasteurized milk counts averaged 67,000, with a variation of 18,000 to 260,000. The percentage reduction averaged 88.8 per cent, with a range of 65.3 to 99.6 per cent. One sample with a count of 750,000 in the raw milk yielded a count of 260,000 after pasteurization, or a reduction of 65.3 per cent. It must be recognized that during the winter months we may expect the reduction in count through pasteurization to be lower than during the summer season because of the different types of bacteria present. In the warmer weather, the growth of bacteria is active and while high counts in the raw milk may be found, the types of bacteria present are much less resistant to heat. The bacteria in the winter milk are much more apt to be resistant forms which fact may explain the lowered "efficiency."

The figures on general plant efficiency, including searches for contamination from coolers, supply tanks, bottlers, and bottles, are so numerous that it is impractical to present them here. In going over these figures, however, it is evident that contamination is decreased with the continued vigilance of bacteriological control, 1925 being much more satisfactory in this respect than either of the preceding years.

A contemplation of the significance of these results of a part-time laboratory control of a milk supply must lead one to recognize the value of this enterprise. It may suggest an adoption of the practice of engaging a student for similar work in many plants during the summer vacations, the months when difficulties in the milk supply are most prevalent. This opportunity offers the milk company a chance to know just what the milk really is, from the standpoint of bacterial content, and to regulate plant operations to provide a low count milk for distribution. Furthermore, by taking a young man into the plant for these few months, a great deal has been done to train the future dairymen in a practical way, to supplement their scientific and fundamental information which a college has given them. Neither can stand alone. The two together, theory and practice, are going to make real contributions to the dairy industry.

This demonstration of the value of a summer labora-ory service leads beyond this point. It has proven worthwhile to this company and it will to others, but it should open, afresh, in the minds of many plant owners he possibility of a full-time, year-round laboratory servce to safeguard the good name of the organization and o prove itself an actual economy, yielding good returns n dollars and cents beyond the cost of maintenance.

(X) = growth (—) = no growth

In the use of cleaning compounds they should always be used in hot solutions in automatic bottle cleaners. It is evident that inasmuch as the germicidal action of the alkalies is due to the chemical action on the cell protoplasm, any increase in the temperature of the solution will have a marked increase on its disinfecting properties. This fact was strikingly illustrated in experiments with various concentrations of sodium hydroxide and sodium carbonate using B. coli as the test organism, the results of which are given in Table 1.

Another fact that is indicated by the data given in Table I is that sodium carbonate used alone is not as efficient as sodium hydroxide used alone or in combination with sodium carbonate. Curiously the combination of sodium hydroxide and sodium carbonate does not appear germicidally as efficient at the 72 degrees F. exposure as sodium hydroxide alone but at the 100 degrees F. exposure these two alkalies used together are more efficient than caustic soda or soda ash used alone.

The experiments with B. coli may be considered as representative of the probable results with most non-spore forming pathogens. B. coli survives in a wider range of acids and alkalies than many other bacteria. The thermal death-point of the particular strain of bovine B. coli used in these experiments was found to be 140 degrees F. for 12 minutes. The thermal death-point of B. diphtheria which has about the average resistance of the non-spore bearing bacteria to disinfectants, is about 140 degrees F. for 10 minutes, or 158 degrees F. for five minutes.

It is obvious that the method outlined is highly efficient in destroying the organisms usually encountered in milk. On the other hand, it is well to know that the tubercle bacillus is resistant to alkalies. Through the courtesy of Dr. W. H. Park, director of New York City Bureau of Laboratories, I was able to obtain data on this point.

As a result of his tests, Dr. Park informs me that the tubercle bacillus will resist four per cent NaOH for four minutes at a temperature of 140 degrees F. When the temperature is increased to 155 degrees F. for two minutes or 160 degrees F. for one minute, the bacillus is killed. It is apparent that the method outlined fully meets these requirements since the bottles are held in the second soaking tank containing four per cent NaOH at a temperature of 160 degrees F. for four minutes, thus insuring the destruction of tubercle bacilli.

Summary.

The practical sterilization of milk bottles by chemical disinfection has been studied. A method of chemical disinfection involving the use of an automatic bottle cleaner has proven equally as safe as the additional sterilization of milk bottles by the autoclave with its attendant practical necessity of bottle storage permitting some air contamination before their use.

The best method of chemical disinfection consisted in the use of an automatic bottle cleaner with three soaking compartments containing detergent solutions with alkalinities of 4 and 4.5 per cent as NaOH in the first two compartments and clean water in the third with temperatures of 120 degrees F., 160 degrees F. and 120 degrees F., respectively. The operation of the unit was so timed as to provide exposures of four minutes duration in each of the three soaking compartments. This process killed all B. coli and provided for the maintenance of proper caustic strength of detergent solutions during the cleansing of approximately 15,000 milk bottles.

From a number of tests, it was determined that a solution of 5 per cent NaOH at a temperature of 100 degrees F. would destroy B. coli of bovine origin within two minutes. Sodium carbonate is not as efficient germicidally as sodium hydroxide used alone or in combination with sodium carbonate.

Sodium hydroxide is not effective in the destruction of tubercle bacilli. The temperature factor of 160 degrees F. for four minutes as used in the second soaking compartment of the cleaner provides for the destruction of any tubercle bacilli exposed to the cleaning operations.

⁂

HOW ABOUT IT?

Montreal, Canada, Sept. 11, 1926.

Editor The Milk Dealer:
Attention Mr. Roy K. Moulton:
Dear Sir:

In your Milk of Human Unkindness you mention the Vegetarians' Union ukase against milk: "Anyone who indulges in quantities of milk develops the brains and mentality of a cow."

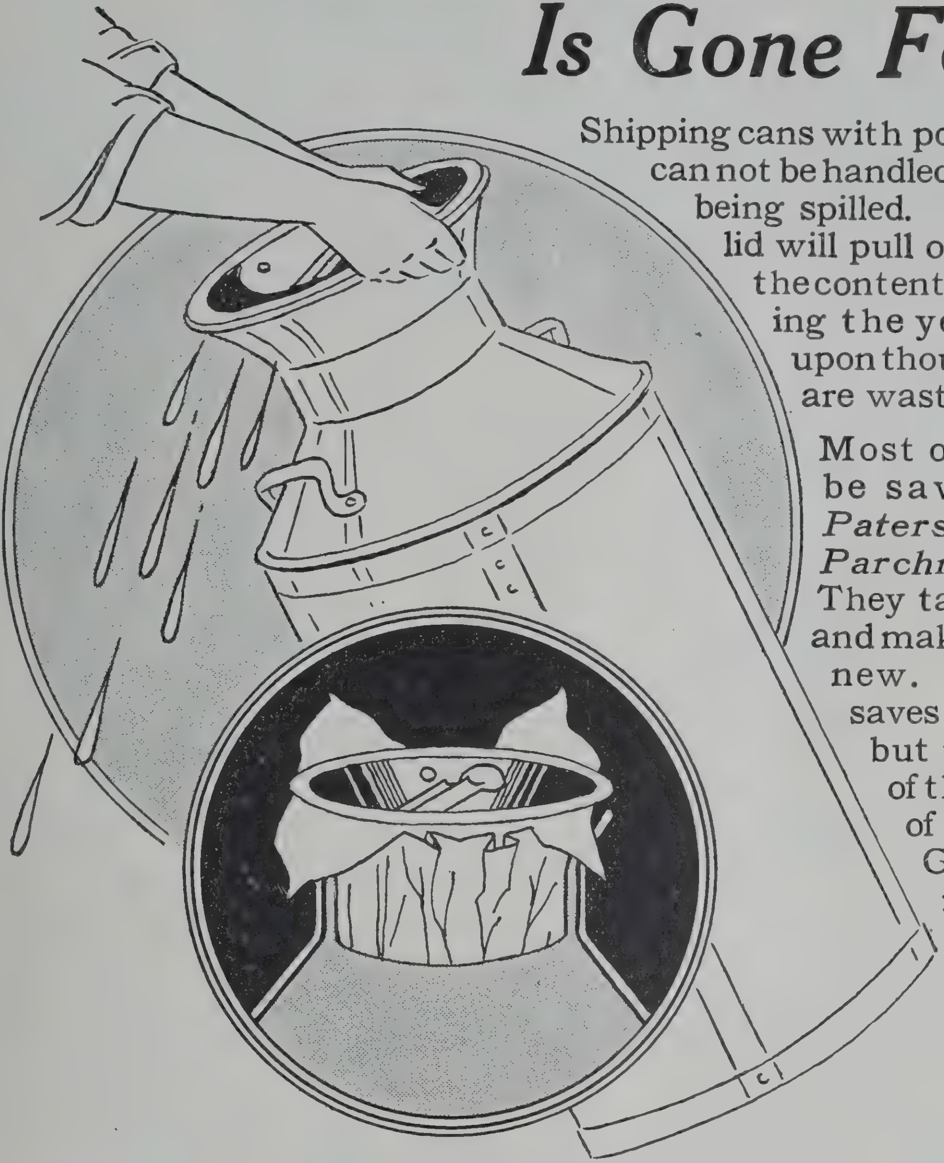
I wish to ask those gentlemen if anyone of them who indulges in fruits and vegetables develops the brains and mentality of a cocoanut or a watermelon?

To me this attack against cows has a weedy flavor.

Yours very truly,

A. D. MOLDAVAN, Laboratories,
Guaranteed Pure Milk Co., Montreal.

Cream Lost Here—Is Gone Forever



Shipping cans with poorly fitting lids can not be handled without cream being spilled. Frequently a lid will pull out and most of the contents are lost. During the year thousands upon thousands of dollars are wasted.

Most of this loss can be saved by using *Paterson Vegetable Parchment Gaskets.* They take up the slack and make all lids fit like new. This not only saves milk and cream but prolongs the life of the can. The cost of the Parchment Gasket is nothing compared to what it saves. That's why millions are used every year.

Special Offer

Send us One Dollar in coin, stamps, check or Money Order and we will send you, Postage paid, 250 Parchment Milk Can Gaskets made from heavy fifty pound stock cut to standard size 11″ x 11″. If you are not satisfied that their constant use will save you money, the amount you paid us will be cheerfully refunded.

The Paterson Parchment Paper Co.

Chicago San Francisco

Passaic :-: New Jersey

You can save money, too!

You may handle only a few cans a day, or week, or you may handle hundreds. But in either case Parchment Gaskets will save many times their cost. Fill out the coupon below and send for the free samples and instructions how to use them.

THE PATERSON PARCHMENT PAPER CO.
35 Eighth Street, Passaic, N. J.

Gentlemen:

Please send us free samples of Paterson Vegetable Parchment Milk Can Gaskets and leaflet called "Making Milk Shipments Pay".

We handle about.................................cans of milk cream a day.

Milk Men as Sales Representatives

Evolution of the Milk Delivery Man—Now a Sales Representative in Many a Modern Milk Concern. Are You Satisfied to Have Your Men Deliver Only Milk?

AMONG many progressive and up-to-date dairies, the place of the old-time milkman, clad in overalls often not overly clean, has been taken by an alert and business-like fellow, whose position is much more than that of a mere delivery man. He has become his employer's trusted sales representative.

This small revolution in a big industry has not been sudden. It took time, as all such changes do. The desire to transform a delivery system, by combining salesmanship with it, could not be had simply for the wish, nor be perfected overnight. In fact, transition from the old way to the new is not yet complete. No uniform method of training drivers to be salesmen has been developed. Various plans are being used. Some are systematic. Others are more or less on the hit-or-miss order. But, for all that, the tendency to combine salesmanship with delivery work, and to adopt some method of training the drivers, is becoming general in the dairy industry.

A study of the methods used in training drivers as salesmen was recently undertaken by the Metropolitan Life Insurance Company, under the direction of Henry Bruere, third vice president, in charge of the Policyholders' Service Bureau, which provides a special service for the company's group insurance policyholders. A short questionnaire was sent to a large number of dairy concerns, and, from replies received, a mass of informative data was obtained.

It was learned from these sources of information that some of the dairy companies conduct training schools for their drivers, in order to teach them the principles of salesmanship. Others hold sales contests and stage demonstration sales campaigns, all with the same purpose in view, while frequently literature on the dairy business in general and salesmanship in particular are distributed to the embryonic salesmen.

For good work done in securing new business some of the companies have installed bonus systems; others pay their driver-salesmen on a salary-commission basis, while a Massachusetts company has held a sales contest with money and merchandise premiums awarded the successful competitors.

In discussing his company's "driver salesman" policy, Franklin G. Cover, personnel director for Borden's Farm Products Company, Inc., says that the bulk of solicitation of new accounts is accomplished directly by the company's route salesman, or wagon drivers. He says his company recently opened a training school for route salesmen that all applicants for such positions must receive instruction there.

"The topics taught," he said, "are as follows: A comprehensive course of instruction on our products, detailing specifically all routine connected with milk from the time it is drawn from the cow until it is ready for delivery at the customer's door. A knowledge of the composition of milk, the food values, differences between the various grades of milk and cream, pasteurization, care of products, transportation, health department regulations and sanitation.

"Under the heading of service are taught the proper methods of handling the products after pasteurization, icing, loading, delivery and method of serving customers in various types of houses, collection of bottles and traffic regulations.

The instruction in salesmanship, Mr. Cover said, includes the following:

Brief information on points in salesmanship, slightly touching upon the science of the subject and particularly stressing the company's policies in regard to the desired relationship between salesmen and the consuming public. This subject is subdivided into several parts touching upon the various stages of a canvass, requirements in regard to the sales talks on company products, solicitation methods, handling competition and personal appearance.

"Our route salesmen," Mr. Cover said, "secure all commissions paid on the sale, whether the original order is taken by the salesman himself or by a special canvasser.

"While our training school is only in its infancy, we have confidence in the good which may be obtained from training our driver salesmen. We believe through this medium we will be able to give a standardized set of instructions to all incoming salesmen. Previous to the installation of the instruction system, the company policies, rules and regulations were taught by many foremen instructors. This made it possible for our salesmen to receive varied types of instruction. We believe that the instruction course will result in even better service to our customers, a more efficient personnel in serving the wants of the public and a better knowledge of company standards by our salesmen."

An interesting and novel view of the driver-salesman plan is taken by a Pennsylvania company. While explaining it adopted the policy of using its drivers as salesmen exclusively and for more than three years has given them a full course of salesmanship instruction, it feels that "the use of a driver as a high pressure salesman is absurd, as he has a full day's work to do before he can get around to do any soliciting, at which time his mind and body are fatigued.

"We believe that it is essential to have a knowledge of salesmanship to make them realize their importance in the industry, but the best trade getters are the efforts of the men to give service and sell themselves to their present customers, who will become salesmen to their neighbors.

This same company, however, specifically states the belief that "any money to be spent for solicitation of new business should accrue to the interest of the man on the daily job," and adds that it has "standing prizes for monthly gains, with special drives and prizes on occasions."

One of the largest of the New York City dairy companies gives practically entire credit to its routemen or route salesmen for the growth of business on their routes. Each routeman receives special instruction for a period of from five to ten days, a portion of which relates to salesmanship. The latter varies according to the ideas of the foreman giving the instruction.

A milk company located in northern New York is so impressed with the importance of wagon men as col-

lectors and salesmen that it recommends discontinuance of the term of "driver". "We do not term or designate the men on our wagon as drivers, as they have to be much more than that", it was explained by an official of the company. "They have to be salesmen and collectors, as well as careful and courteous delivery men." This company is also one of those providing systematic instructions for its wagon men, who are trained under the tutelage of foremen.

One of the New England dairies gives emphatic recognition of the driver-salesman problem, declaring it among the most important now confronting the dairy industry. It has given the question much thought and devised various expedients to increase the interest of route salesmen in their work, for the company has completely discarded the designation of "driver."

"The man who operates one of our wagons successfully must be four-fifths salesman and one-fifth peddler," it was explained. "He does his own collecting and receives 11 per cent commission on all his sales; he does his own bookkeeping and keeps a record of his sales.

"We hold weekly meetings of our route salesmen to keep them on the move for new business. We hold a luncheon about every three months at which we have some outside speakers.

"I think that it is absolutely essential for the greatest success in this business to have men who are not drivers but salesmen. The man must first like the work and be able to get out of bed in the morning; there are few among them who have any real training in salesmanship. We try to give this training in a small way."

⁂

PRICE CUTTING—ARE YOU GUILTY?

The price-cutter is worse than a criminal. He is a fool. He not only pulls down the standing of his goods; he not only pulls down his competitors; he pulls down himself and his whole trade. He scuttles the ship in which he, himself, is afloat.

Nothing is so easy as to cut prices; and nothing is so hard as to get them back when once they have been pulled down.

Any child can throw a glass of water on the floor, but all the wisest scientists in the world can't pick that water up.

Who gets the benefit of price-cutting?

Nobody.

The man who sells makes no net profit; and the man who buys soon finds himself getting an inferior article.

No manufacturer can permanently keep up the standard of his goods if the price is persistently cut. Pretty soon he is compelled to use cheaper materials, and to cut down the wages of his workers.

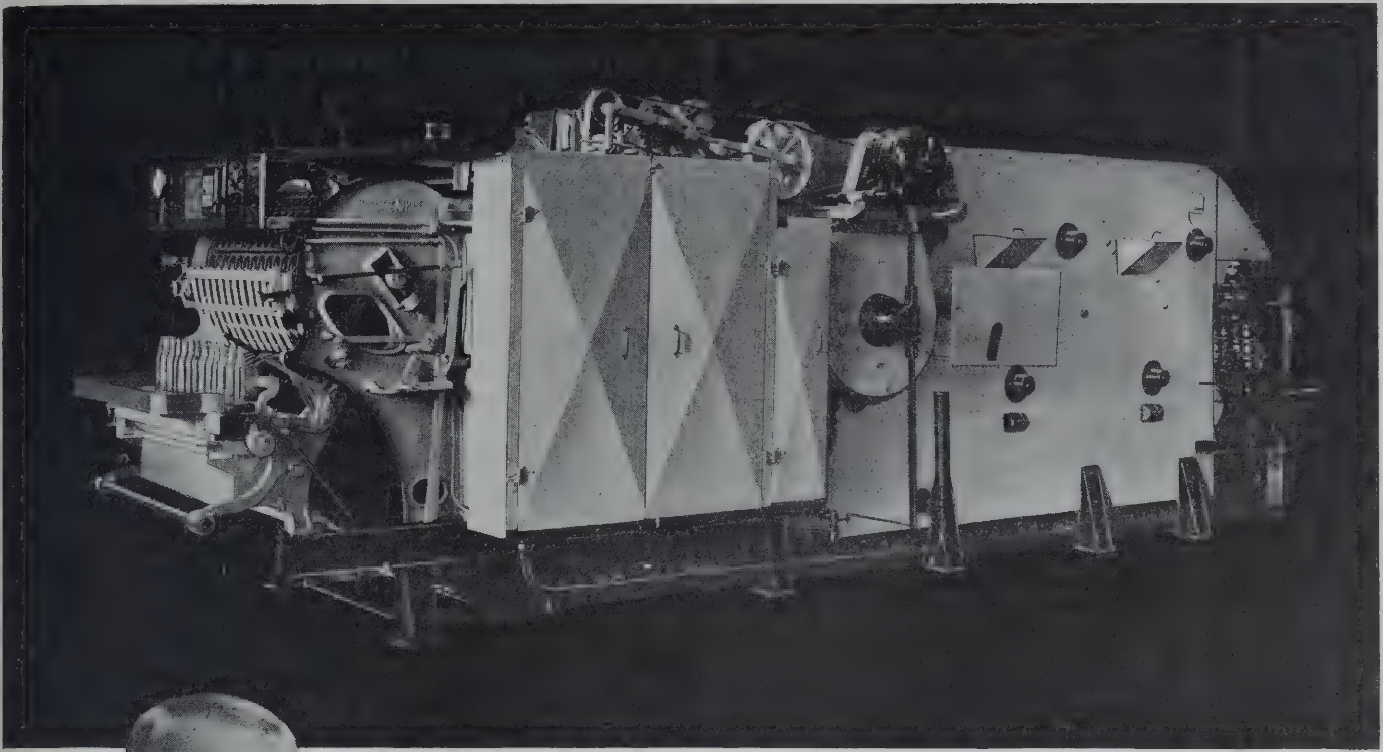
The man who cuts prices puts up the sign: "This way to the junk heap."

He admits his own failure as a salesman. He admits he has been defeated according to the Marquis of Queensbury rules of business. He admits he cannot win by fighting fair.

He brands himself as a hitter-below-the-belt.

If the business world were dominated by price-cutters, there would be no business at all.

Price-cutting, in fact, is not business any more than smallpox is health.—Ex.



Mr. Edward Seybold, President of the Waukesha Milk Company of Milwaukee

Mr. Seybold says:

"As a user of the Meyer Dumore Bottle Cleaner for the past two years, I wish to express in writing my appreciation of the excellent service rendered by this machine.

"During this period our operating cost has been negligible, and many complimentary remarks have been made by visitors relative to the continuous line of clean, shining bottles coming from the machine, demonstrating the efficiency of the work done.

"We do not hesitate to give a certain amount of credit to your washer for our phenomenal success during the past two years.

"In conclusion, please accept my thanks for the personal attention given by your organization."

This wholehearted, forceful statement, signed by Mr. Seybold, is a convincing testimonial of the bottle-cleaning capabilities of the Meyer-Dumore machine.

Notice these words especially: "We do not hesitate to give a certain amount of credit to your washer for our phenomenal success during the past two years!"

This can mean only one thing: the Dumore method of soaking, washing, brushing and rebrushing, rinsing and rerinsing, is so thorough that the quality of its work reflects through the contents of the bottles directly to the consumer.

What the Dumore has done for the Waukesha Milk Company it can also do for your plant. Write today for bulletins and details of our engineering service — *they mean money to you!*

MEYER-DUMORE BOTTLE CLEANER

Correspondence Covering a Variety of Subjects of Interest to Milk Distributors

Dear Sir:—My business is a pasteurization milk plant and I want to dispose of the milk that is turned to the plant by the drivers. Besides this I want to dispose of the surplus when this gets more than 48 hours in the refrigerating room and also of the buttermilk coming from the churning.

For the mentioned purposes I do the following. I let the turned milk stand in the refrigerating room until next day; then I heat the milk to 86 to 95 degrees F., I separate the cream (33 per cent fat), I put the cream in the refrigerating room for 24 hours and churn it sweet. I let the skim milk coming from the separator go down to 68 degrees F. then I mix it well with the mother starter (2 per cent of starter) and immediately I bottle the mixture and let the bottles (one-third of a quart bottles) stand in room temperature for 14 to 18 hours (temperature in room runs from 73 to 68 degrees F. during that time). When the milk curdles I put it in the refrigerating room (39 degrees F.) for 24 hours and after this I send it to be sold to the stores. I do the same thing with the surplus that reaches more than 48 hours. Generally, I don't use mother starter with the buttermilk coming from the churning work, but only let it stand in room temperature; and I must say that this buttermilk sometimes curdles in 5 to 6 hours notwithstanding that it comes from sweet cream and that it has only about 0.17 acidity. I control the acidity in the different parts of the work. For instance, the acidity of mother starter is about 7.65; the acidity of the buttermilk 6.5; the acidity of the milk before mixed with the starter 0.16 to 0.18. Under the same conditions some days I have a good product, but a very bad one some other days with plenty wheying off on top and bottom. I work every day the mother starter with milk heated to 147 degrees F. for one to one and a half hour, using 3 per cent of the day before starter.

So the first question to ask is this: Is turned back milk or 48 hour milk good material for buttermilk? I think that the acidity of the material used has not much to do with the last product and that perhaps other milk germs are responsible and the real controllers of the matter; and I say this because with the same acidity I have good and bad product. Another trouble is that the buttermilk goes in good condition to the stores where it is kept in the ice boxes at about 53 to 62 degrees F. and after 6 to 8 hours it is wheyed off and I cannot sell it. How long and at what temperature do you think is possible to keep buttermilk in our stores? Do you think that the driving on our delivery wagons could have some influence on this point?

I cannot do other things than to incubate the milk in the bottles because people don't accept broken buttermilk, they ask for a curdled milk like it looks before breaking it.

I will fully appreciate your advice for getting a good product considering my local conditions.

Do you think that heating cold pasteurized milk to 86 to 95 degrees F. to separate the cream and bring down the skim to 68 degrees means a bad thing for good buttermilk?

Reply: I see no reason why the 48 hour milk should not be quite satisfactory for the manufacture of commercial buttermilk providing it has not been allowed to stand at a warm enough temperature to cause partial curdling during the pasteurization process. This could be determined by making a careful examination after pasteurizing to note whether slight curdling had taken place. If it has then in all probability the samples will whey off quite readily when the buttermilk is made. From what you say, however, I do not believe this is causing your difficulty as you mention the acidity as under .18 per cent and ordinarily milk does not curdle when heated with this low content of acid. I suggest that you store the milk at a temperature of about 10 degrees C. and instead of heating to 35 degrees C. heat to 30 degrees C. before separating, cooling the resulting skim milk to 20 degrees C. as specified. I suggest that you add 3 per cent of starter to the skim milk.

As to the preparation of the buttermilk from the churn, I would advise adding 5 per cent of good starter to this product. This should help prevent wheying off.

I do not believe your trouble is caused by undesirable bacteria that get into the milk. I feel confident the difficulty is caused by the agitation which the milk bottles receive in transit to the various stores. During the delivery period the buttermilk would naturally heat up and a very slight amount of agitation will cause it to whey off in a relatively short period even though wheying off is not visible in the outset. If the buttermilk is handled carefully and not kept at ice box temperatures above 10 degrees C. you should be able to keep it for 24 hours without difficulty. I think your trouble is all caused by too high ice box temperatures and the agitation on the routes. It is very difficult to outline specific details for handling the buttermilk problem in your locality and the above suggestions are given in the hope that they may help solve some of your difficulties.

Dear Sir:—Will you please send me bulletin on cheese making; does your regular bulletin include the making of Neufchatel cheese?

Reply: I am very sorry that we have no publications relative to cheese at this college other than the enclosed, which is a government bulletin. However, a good formula for the manufacture of Neufchatel cheese is as follows:

Whole Milk Neufchatel.

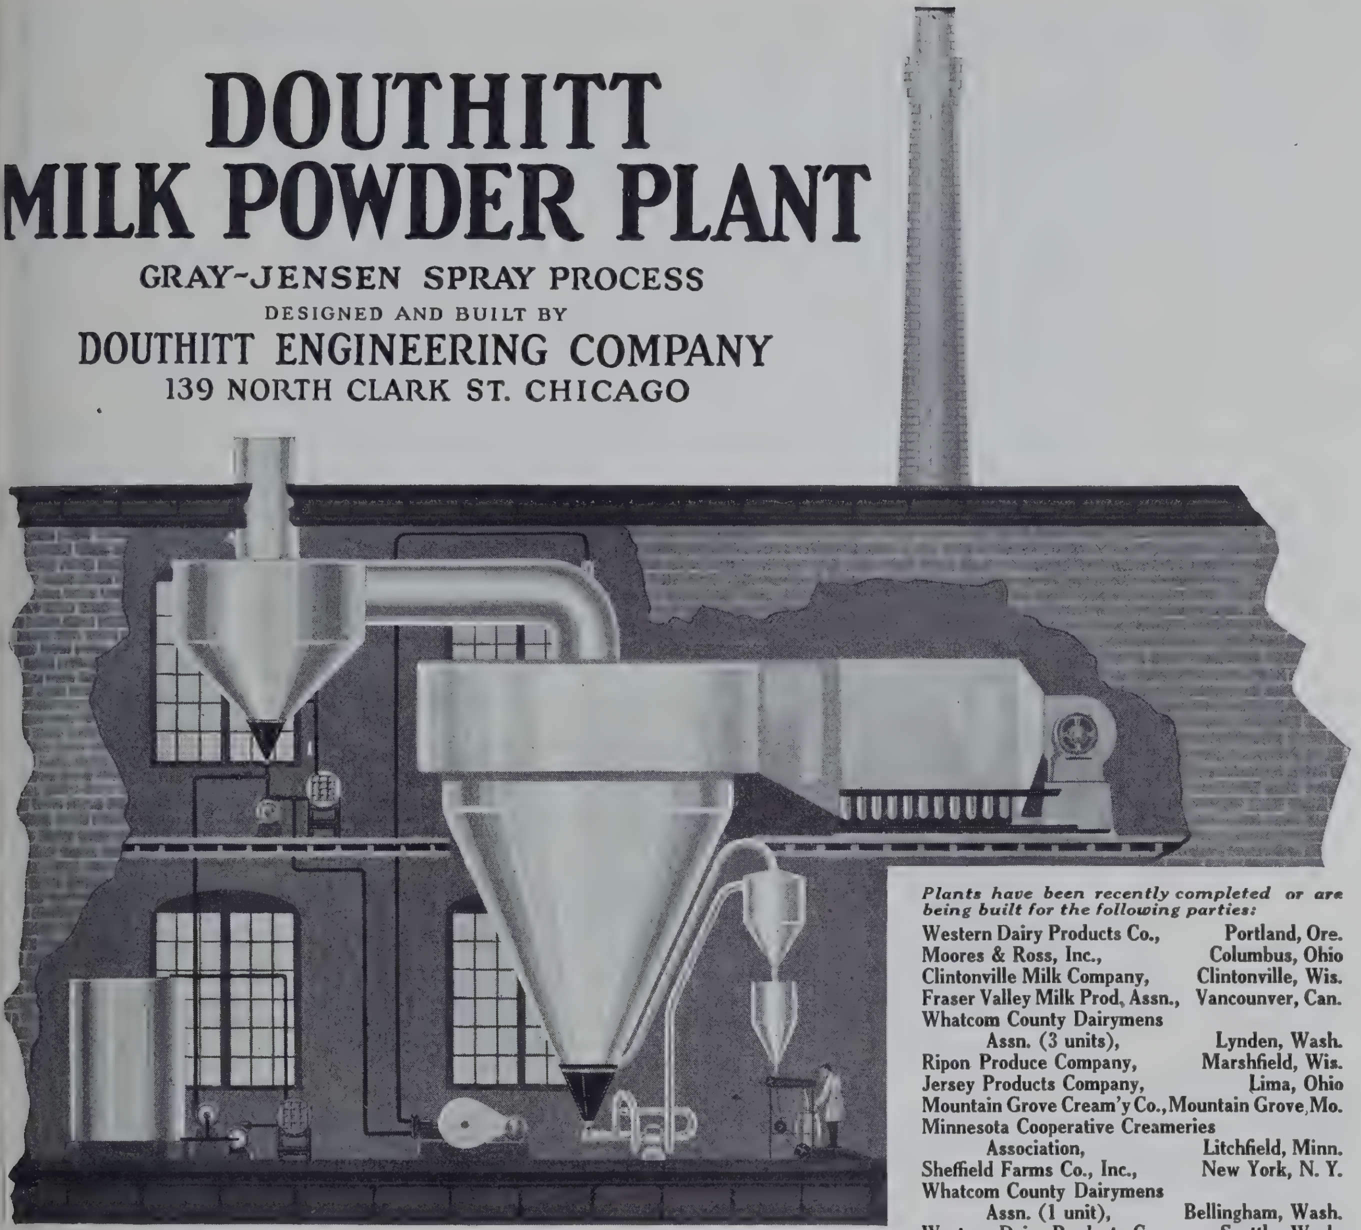
For this product you may use either pasteurized or unpasteurized raw milk and I suggest you divide the milk up into three lots of about thirty-three pounds each. Set the milk at a temperature of 86 degrees F. Add one-quarter pint of starter and ten to twelve drops of rennet for each thirty-three pounds. I have always been setting the milk at 86 degrees and placing it in an ice box which has a temperature of about 60 degrees F. By morning I find the milk is nicely curdled and well cooled. I then follow the practice of pouring it out onto a cloth to drain until most of the free whey has escaped, after which I apply pressure. You may apply pressure through the use of a mechanical device or press the cheese in a draining cloth between flat boards which are well weighted down. After four or five hours the cheese should be fairly firm but smooth and readily spread.

* * *

Dear Sir:—We are having serious trouble with our sweet cream souring before consumer can use it. We are pasteurizing our sweet milk in a 200-gallon glass-lined tank, but do not have enough cream to pasteurize successfully—that is, we do not have enough to get it up

DOUTHITT MILK POWDER PLANT

GRAY-JENSEN SPRAY PROCESS
DESIGNED AND BUILT BY
DOUTHITT ENGINEERING COMPANY
139 NORTH CLARK ST. CHICAGO



Plants have been recently completed or are being built for the following parties:

Western Dairy Products Co.,	Portland, Ore.
Moores & Ross, Inc.,	Columbus, Ohio
Clintonville Milk Company,	Clintonville, Wis.
Fraser Valley Milk Prod. Assn.,	Vancounver, Can.
Whatcom County Dairymens Assn. (3 units),	Lynden, Wash.
Ripon Produce Company,	Marshfield, Wis.
Jersey Products Company,	Lima, Ohio
Mountain Grove Cream'y Co.,	Mountain Grove, Mo.
Minnesota Cooperative Creameries Association,	Litchfield, Minn.
Sheffield Farms Co., Inc.,	New York, N. Y.
Whatcom County Dairymens Assn. (1 unit),	Bellingham, Wash.
Western Dairy Products Co.,	Seattle, Wash.
Los Angeles Creamery,	Tulare, Cal.

30 Plants Operating. 5 Plants Being Installed.

WE guarantee 100% recovery of milk solids on capacity operation. No other plant can make such recovery.

No precondensing necessary. No condensing water used. Only water required is for boilers and to wash up plant each day.

Only 1 man necessary to operate plant and pack milk powder in barrels.

The plant is easily kept in absolutely sanitary condition. It can be thoroughly washed and sterilized each day.

Easily and instantaneously regulated to leave any desired percentage of moisture in powder.

½ minute from milk to powder; the shortness of time during which the milk is exposed to heat insures superior quality of powder, entirely soluble in cold water, manufactured at lowest possible cost and sells for highest market price.

The powder is automatically and instantaneously removed from the drying chamber, also cooled as delivered into barrels. Other plants require from 1 to 20 hours to accomplish the same results. Milk powder allowed to remain in drying chamber until the day's run is completed becomes thoroughly mixed while being removed, therefore there is no advantage in grading such powder as the lowest quality made that day governs the grade for the day's run.

The saving in milk powder, fuel, labor and power, as compared to other milk powder plants, is sufficient to pay for one of our plants in from 1 to 3 years. Manufacturers are discarding other types of milk powder plants and installing the Douthitt plant, the life of which is from 15 to 20 years.

We will furnish a guaranteed market for all skim milk powder manufactured on our plants.

We pay traveling expenses of responsible parties sufficiently interested to visit one of our plants.

Write today for booklet describing the Douthitt milk powder plant.

over agitator in pasteurizer, so we have to cool and bottle raw. We bottle twice daily. The afternoon's milk is separated and bottled for the morning's delivery, and the morning's milk is bottled for the afternoon run. In some cases the cream is sour before delivery. We cool to 45 degrees and hold in milk vault around an average temperature of 40 to 45 degrees. Our separator is thoroughly washed and steamed twice daily. Also disks are soaked in sterilizing solution. The average bacteria count on milk before separations is between 60,000 and 100,000.

Will you kindly give us any suggestions you think would be of assistance to us. Our milk is splendid. We are not having any trouble with it to speak of, but the cream is certainly giving us lots of grief. We try to keep all of our equipment clean as possible. Our cans are used for all purposes such as buttermilk, sour cream, etc., but are all thoroughly washed before using.

The separator has had a small portion of sour milk through it at one time. This happens to be milk just beginning to sour.

Reply: You probably would not find it possible to handle the raw cream satisfactorily in any case.

I would suggest that you rig up a little pasteurizer from a half barrel such as cocoa cola barrel or a ten-gallon ice cream packer, or even a five-gallon packer and pasteurize your sweet cream in a ten-gallon can by setting this can into the half barrel or packer containing water. The water around the ten-gallon cream can can be heated by connecting a small steam line to it. You can very easily heat up a ten-gallon can of cream in this way and pasteurize it.

While this can of cream is heated, however, someone should be there to constantly stir this cream, not too violently but just with a gentle motion of the stirring rod. After the cream has come up to the pasteurizing temperature of 142 or 143 degrees it will not be necessary to stir for the holding time. Before allowing the can, however, to stand for 30 minutes it would be best to see that the temperature of the water on the outside of the can is not boiling or else it might scale some of the cream or if you continue to stir it, would heat the cream to too high a temperature. You can very easily determine just how to handle this method of pasteurizing your sweet cream with a little practice from day to day. A satisfactory pasteurized, bottled cream should test about 35 per cent butterfat unless it would be a special coffee cream which you could have test 22 to 25 per cent.

* * *

Dear Sir:—I am having trouble with our buttermilk and will appreciate any advice which you may be able to give me.

The buttermilk cracks in the middle or wheys off at the bottom, and not at the top as it should. We use what skim milk we have, and make up any shortage by adding skim milk powder. We heat this in a coil vat to 180 degrees and then cool to 68-70 degrees depending on weather conditions. Cooling takes about 2½ hours. Then 1 or 1½ per cent of starter is added and the buttermilk is ready in about 12 hours. Then it is broken and cooled to 50 degrees which takes about an hour and run through a small pump to bottler. The buttermilk is then put in an ice box where the temperature is about 50 degrees. I do not think that our trouble is with starter as it seems very good.

I shall greatly appreciate any suggestions which you may be able to give me.

Reply: There are three possible causes that may be producing your difficulty. One is the use of skim milk powder. You know the casein in skim milk powder is in just a little different state than in the skim milk which has been untreated. The skim milk powder, however should go into solution quite readily and if it does not I would suggest that you strain it after it reaches a temperature of about 120 degrees, thereby taking out any lumps, and then continue the pasteurization. This may help in enabling you to overcome your difficulty, but I do not believe it will entirely prevent it.

Another suggestion is that you add about 3 per cent starter instead of 1.5 per cent, setting it later in the evening. This will probably give you a little thicker product but should help overcome the difficulty.

Another factor may be that you are breaking up the cultured product at either too warm or too low a temperature. If you begin the breaking up process at a temperature of 70 degrees, cooling and breaking it up without undue agitation, wheying should not occur.

I have run into the difficulty which you speak of many times in making commercial buttermilk and it is invariably produced by breaking up too vigorously at the wrong temperatures. Even at the temperature above suggested, 70 degrees or less, wheying off will occur if agitation is sufficiently vigorous to incorporate air. Break the curd up so that foaming does not occur and I believe you will not have any difficulty.

I believe it is this last factor that will overcome your trouble and I would suggest you try it first as the remedy.

The New PFAUDLERETTE

[AT MARKEDLY LOWER PRICES]

(Following the successful manufacturing and marketing of the "C-Gal" Pasteurizer, we have installed new plant machinery of the same type for the manufacture of the New Pfaudlerette. Thus we have introduced the same economies of manufacture into this larger unit without in any way sacrificing its original quality.

(The insulated base unit selling at $650.00 represents a saving of $187.00 over the old insulated Pfaudlerette which, as listed in our published prices, sold at $837.00.

(On the complete motor-driven Pfaudlerette with insulated cover, there is a total saving of $347.00.

(AND IN ADDITION TO THIS, the New Pfaudlerette has a working capacity of 330 gallons (actual, 350 gallons), the increase of 30 gallons over the old model being furnished without additional charge. ORDER YOUR UNIT NOW.

one of these, as we have no viscolizer, and we have no means of making a 10 per cent cream. If you know of some simple method which helps to make the sour cream appear thicker and richer kindly let me know at once by mail.

Reply: I regret that I failed to publish a formula for sour cream without the use of a viscolizer. I trust the following will help you.

To your 20 per cent cream add 2 to 3 per cent skimmilk powder. Heat slowly to 120 degrees F. to dissolve the powder and follow this by pasteurizing at 145 degrees F. for thirty minutes. Cool to 40 degrees F. and hold at this temperature over night. The following morning warm to 70-74 degrees F. and add 3 to 5 per cent of good starter, thoroughly broken up. Dilute twenty drops of commercial rennet extract with about one-half glass of water and add this to one hundred pounds of cream, agitating it thoroughly to distribute the rennet. The rennet helps to form a thick curd and the cream may curdle in a relatively short period. However, you should hold it over night at the ripening temperature of 70-74 degrees F. to develop the desired acid flavor. Follow this by breaking up the curd while cooling to 40 degrees F. and hold at this low storage temperature.

In conclusion I would like to state that I have eliminated the first step of holding at 40 degrees F. over night, simply cooling the cream to 74 degrees F. after pasteurization and then adding the starter and rennet, with very satisfactory results. However, the first procedure given should give you a little heavier appearing product.

THE FLORIDA HURRICANE HARNESSED.

It is interesting to ponder over the enormousness of Nature's forces behind the recent Florida hurricane Think of the benefits that could have been derived from such tremendous power, were it harnessed, rather than the destruction and misery it caused! The power in that storm was sufficient to furnish light, power, and heat to Miami for years; to dig canals; to melt many tons of steel in furnaces; and to add vastly to the development of Florida instead of tearing it down. Some day, perhaps, high winds like that will be welcomed—but not in 1926.

In the newspaper accounts that I have read of the storm I did not find the velocity of the wind mentioned But according to my engineering handbook the highest authentic velocity in a previous storm occurred in the vicinity of St. Paul, Minn., and was about 80 miles per hour. The velocity of the Florida storm was probably greater, but 80 miles is high enough for computing the approximate power of the Florida storm.

The path of this storm, it is said, was about 60 miles wide. Of course its exact depth is not known. Probably it was several miles deep. But let us say that it was a quarter of a mile deep. On that basis, had the storm been harnessed to a depth of one-fourth mile and throughout its entire width, it would have developed 12,500,000 horse power. Just think of that!

In other words, it is safe to say that the power of the Florida storm was equal to the entire steam power produced in the entire United States with all steam turbines and engines operating simultaneously.—W. F. Schaphorst.

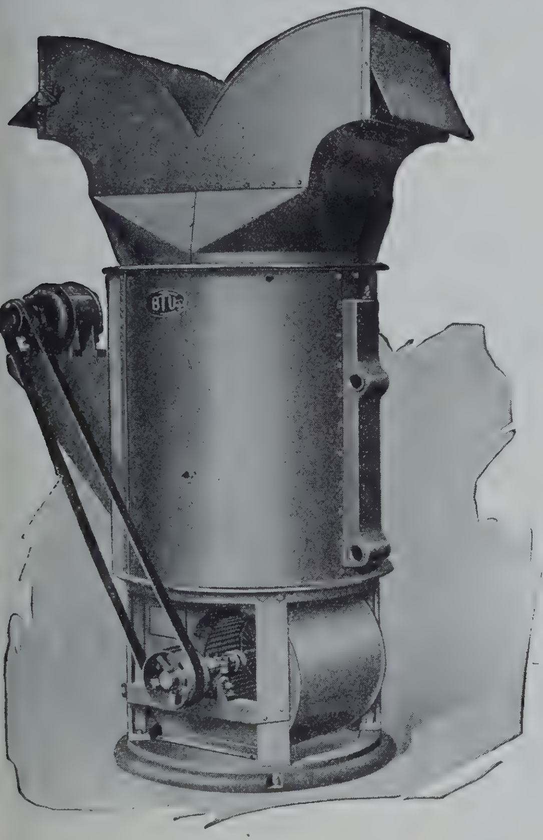
Everything for the Dairy Industry

ON DAIRY PRODUCTS ALL THRIVE

Kill the Fog—Improve Working Conditions—Have a Dry Plant—With Bayley Thermo Unit



A LOW-PRICED, self-contained heating and ventilating system, requiring a minimum of steam, a minimum of space, a minimum of power, and a minimum of attention—*but it produces maximum results*. It is shipped fully assembled, ready to operate after 3 simple connections have been made—very easy to install.

Its heating principle is simple and natural; it simply draws in the colder air from the floor, forces it through and around the heating coils by means of the Bayley Flexiform Fans, and the warm air is circulated downward from the ceiling, along the floor and back to the base of the heater. It heats the room uniformly and insures a warm floor.

It improves working conditions by supplying fresh, dry air that eliminates fog, and that keeps the ceiling and walls dry. This is a big factor in making the right impression on patrons and in keeping employees in good health and good humor.

IT may be used as a heating unit only, or as a heating and ventilating unit, taking part or all of the air from out-of-doors. It works equally well with exhaust steam at low pressure, or live steam by boiler pressure, without any change or regulation of the equipment.

Made in five sizes, 30, 36, 42, 48 and 60 inch diameters—a range suitable for every heating requirement. Ask for special folder giving complete description, specifications and prices.

The Chinook, a compact, smaller capacity heating unit has certain advantages for some classes of installations—longer lived and more efficient than most small heaters. Ask us about it.

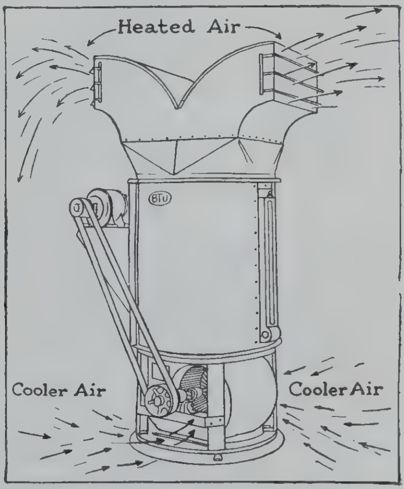


DIAGRAM showing how the air is circulated and warmed, the cooler air from the floor entering the heater at the bottom, after which it is heated as it is forced through and around the heating coils.

New Home Reflects Union Dairy's Growt

A monument to the efforts and industry of C. F. Kaiser and A. J. Hill, proprietors of the Union Dairy Company, is the new and modern dairy products manufacturing plant recently erected at the corner of East Douglas St. and North Adams St., Freeport, Ill. It is the realization of a dream which has long been in the minds of these two aggressive gentlemen. In fact, its seed was planted as early as 1916, when Messrs. Hall and Kaiser decided to go into partnership, founded the Union Dairy Co., and began operations in the building located on East Stephenson St. Steady increase in business was enjoyed and during the last few years facilities were entirely inadequate.

In relating the history of the firm, officials recall that the original investment of $1,000 was in danger of loss several times.

The Union dairy pays out annually to the milk producers in the vicinity of Freeport approximately $75,000 which will be increased by several thousand dollars this year.

Much New Equipment.

The new plant also houses about $20,000 worth of new equipment including milk pasteurizers, preheaters, coolers, buttermilk machinery, culture cans and butter churn.

A feature is the new milk cooler which cools the milk for bottling. The milk flows over the cooler in a thin film and is chilled to 35 degrees F. almost instantaneously. This cooler is surrounded by a plate-glass enclosure free from dust and draft, thus assuring a clean, wholesome product.

The plant is now producing approximately 5,000 quarts of milk and cream each day, and 150 pounds of cottage cheese. The new equipment will take care of increased business for years to come.

Modern new home located at East Douglas St. and North Adams

MILK BOTTLES AS AMMUNITION ROUTS BANDIT.

Armed with a dozen milk bottles, Sam Dunn, 705 Cedar St., a milk wagon driver, put to rout a lone bandit who held him up with a gun early Sunday morning and demanded money.

Dunn was driving down Mitchell St. when an automobile drove up alongside him and the driver ordered him to stop. Thinking that the man wished to purchase a quart of milk for breakfast, Dan stopped and reached for a bottle. He had the bottle in his hand when the man got out of the car and came up to the wagon, gun in hand.

When the man asked for money, Dunn threw the milk bottle at him, striking him on the head. The bottle opened, giving the other a milky bath.

As the man picked himself up and ran to his car, Dunn grabbed a tray of quart bottles and ran after him, throwing the bottles as he ran. The bandit's car turned north on Twenty-third Ave. and disappeared as Dunn threw the last bottle.—Milwaukee, Wis., Journal.

JOHN W. LADD COMPANY

DETROIT COLUMBUS CLEVELAND CINCINNATI

Many Short Courses Are Offered

Excellent Courses in Dairy Manufacture Will be Given by Large Number of Universities and Colleges

WITH the flush season now past in the dairy industries, many of those engaged in the manufacture of the various dairy products are making plans to attend the dairy manufacturing short courses that will be offered by the various state universities and colleges. So popular has the short course become during recent years that most of the dairy schools will offer courses in at least some phase of the industries; while a great number will give complete courses, with reference to the dairy industries.

Most of the leaders within the industries have learned the value of attending the short course, and not only do they make every effort to be in attendance themselves, but they also make provision to have some of their employees attend. In general, the courses offered by the various institutions are very strong; inasmuch as most of them not only employ their own staff of instructors for this work, but they also go to considerable expense and effort to secure the best and most advanced men in the industries to give special lectures and demonstrations.

Nebraska Has Six Months' Course.

At the Nebraska College of Agriculture, University of Nebraska, a six months' course in dairy manufacture will be offered from Oct. 4 to April 13. The enrollment will be limited to 20 students. Full courses in the manufacture of ice cream, butter and both soft and ripened cheese will be given, in addition to market milk work.

Iowa State College at Ames will have its usual six months' short course, and also the ten days' course. The latter is designed largely for those who have had previous experience in the manufacture of dairy products. Complete courses in all of dairy industries will be given at the courses.

Under the direction of W. B. Combs, the University of Minnesota will offer three short courses during the coming year. The first will be the ten-day ice cream short course which will be given Nov. 10-20. Two courses will be given for creamery operators, one of which is designed for the experienced operator and will be given Dec. 1-15. The other will be for beginners and will extend over a period from Jan. 5 to Feb. 16.

Tennessee is offering three courses of a duration of 12 weeks which will embrace creamery practice, ice cream manufacture, testing, cheesemaking, and market milk work. Although those at the university are desirous of having the student take the year's course, they point out that it is possible for a student to enroll for any one of the three terms.

Two Courses at Cornell.

At the New York State College of Agriculture, Cornell University, two courses, each of six weeks' duration, will be given. The first six weeks' course will include such subjects as milk testing, starters, dairy bacteriology, chemistry, arithmetic and mechanics. During the second term, subjects will consist of work in market milk, ice cream, cheese, condensed and powdered milk and butter. Only those having satisfactorily completed the first six weeks' work can register for the second term.

The University of Idaho will offer a five months' course in dairy manufactures, which will be divided into two terms. The first will open Oct. 27 and will run to Jan. 19. During this term the work will consist of testing, bacteriology, cheesemaking and ice cream makin and dairy calculations and mechanics. The second ter will extend from Jan. 20 to Mar. 30. During this ter such subjects as buttermaking, market milk, factor management, dairy calculations and the scoring of dair products will be given.

A twelve weeks' course consisting of work in testin market milk, butter and cheese manufacture, ice crea making, dairy sanitation and mechanics and the busines of dairying will be given at Rutgers University, Stat University of New Jersey. The course will open No 15 and will close Feb. 18.

Pennsylvania has Strong Course.

Three courses, each of two weeks' duration, will b given by the dairy department of the Pennsylvani State College. The first will be given Jan. 6-21, and wi be for those wishing work in testing and butter an cheese manufacture. The second is an ice cream cours and will extend from Jan. 24 to Feb. 4, while the las course will be given Feb. 7-18 and will cover work i market milk and milk condensing.

The University of Wisconsin will offer a galaxy o courses for those in the dairy industries. The first wi be a three months' dairy course extending from No 3 to Jan. 27. A summer dairy course is open to student any time between Mar. 1 and Nov. 1. Special one-wee courses for experienced buttermakers, American cheese makers, ice cream makers and managers will be give the first week in February, while a special week's cours for experienced brick cheese makers will be offered th last week in February. A Swiss cheese course will b given the second and third weeks in February. Exper enced ice cream makers will have an opportunity to a tend a course from Jan. 3 to 26.

GOOD OLD DAYS.

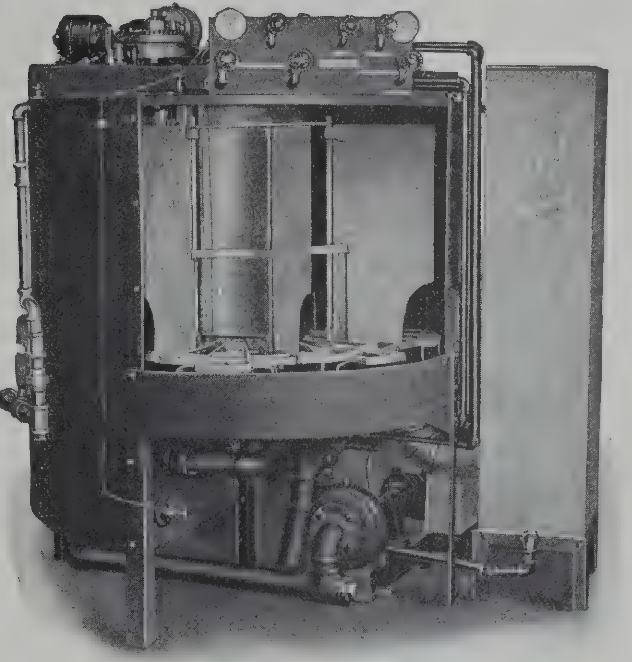
Those who think the good old days were better whe living was more simple and that greater economy wa practiced, fail to analyze the situation then and now We gather a rather interesting comparison between th good old days and the present from the Minnesota Highway News.

In part it states that in the first years after th colonies became a republic, funds were so meager an the people so poor that the commonwealth could not assume the burden of road building. Instead, private companies were formed to build and maintain turnpikes fo which service they were authorized to charge a toll fo the use of the road. A schedule of tolls running fro one cent per mile for every ten sheep or hogs up to thre cents per mile for wagons, stages, private carriages, an like conveyances drawn by horses was legally permitte the company.

These roads were very poor; ruts were left unsmoothed; bridges sagged and fell in; vehicles mired i mud holes. Yet the toll companies claimed their return were so small they could not afford repairs. It costs today, over a concrete highway where 500 vehicles pe day pass, about 1¾ cents per vehicle per mile. This i a trifle more than half of what our ancestors used t pay to travel the mud, dust, and ruts in the good ol days.—Hoard's Dairyman.

This is the Rotary Can Washer that went over big at the Show!

The R & A Low Duty Can Washer displayed at the show. This model thoroughly washes, thoroughly rinses and thoroughly dries three cans per minute.



Visitors at the show displayed equal, if not greater, interest in the larger R & A Rotary, which washes, rinses and dries six cans per minute with thoroughness and dispatch that has earned the sincere praise from every milk plant using it.

ONE big buyer of dairy equipment walked up to an R & A salesman at the show and said, "Well, I've looked them all over. I am going to buy four can washers — *and they're going to be R & A Rotaries.*" (Name on request.)

This, however, was but one of many similar experiences. For, both the six can per minute and the three can per minute R & A Washers seemed to meet perfectly the dairymen's ideas of what a real, serviceable can washer should be. Briefly, these R & A Rotaries rang the bell!

And, if you will look carefully and analytically into the can washer subject—determine for yourself *what a can washer should do, how it should be built, and what it should cost*—you will find that the R & A Rotaries are exceptionally praiseworthy pieces of dairy equipment.

They are rugged. They are simply constructed and accessible. They do their work thoroughly—*produce clean, dry cans and covers.* They are available in two capacities. And their first cost and maintenance cost are both extremely moderate.

Isn't that just what you, too, are seeking in a can washer?

Let us send you complete mechanical details and prices on these Rotaries. Just ask for Bulletin 615X.

Eighty-four and four tenths per cent milk supply of the ten principal cities comes from tuberculin tested cows.

Twenty-six counties have completed tuberculosis eradication work.

Fourteen counties are now actively engaged in tuberculosis eradication, with 4,079 head of cattle so tested during August, and a total of 102,392 head tested to date.

Clark and Floyd counties, Indiana, just across the river from Louisville, have made appropriations for making each county a modified accredited area.

"HISTORY OF DAIRYING."

HISTORY
OF
DAIRYING
T. R. PIRTLE
MOJONNIER BROS. CO.
CHICAGO

What no one has ever attempted before will soon have been completed. T. R. Pirtle, assistant marketing specialist, U. S. Dept. of Agriculture, has written the "History of Dairying" which is now being printed and bound in the Olsen Publishing Company's big plant. We are moving along rapidly in the science and art of dairying. Mr. Pirtle has collected a record of the many steps that have influenced the progress that has been made the world over. Mojonnier Bros., Chicago, are financing the publishing of the book, which will be ready for sale soon.

Each year sees more and more books on dairying subjects turned out of our printery and bindery. In developing that phase of our business we feel that we are contributing distinctly to further progress in the industry.

When the "History of Dairying" is ready for sale we will be prepared to take orders at a price to be determined later by the publishers.

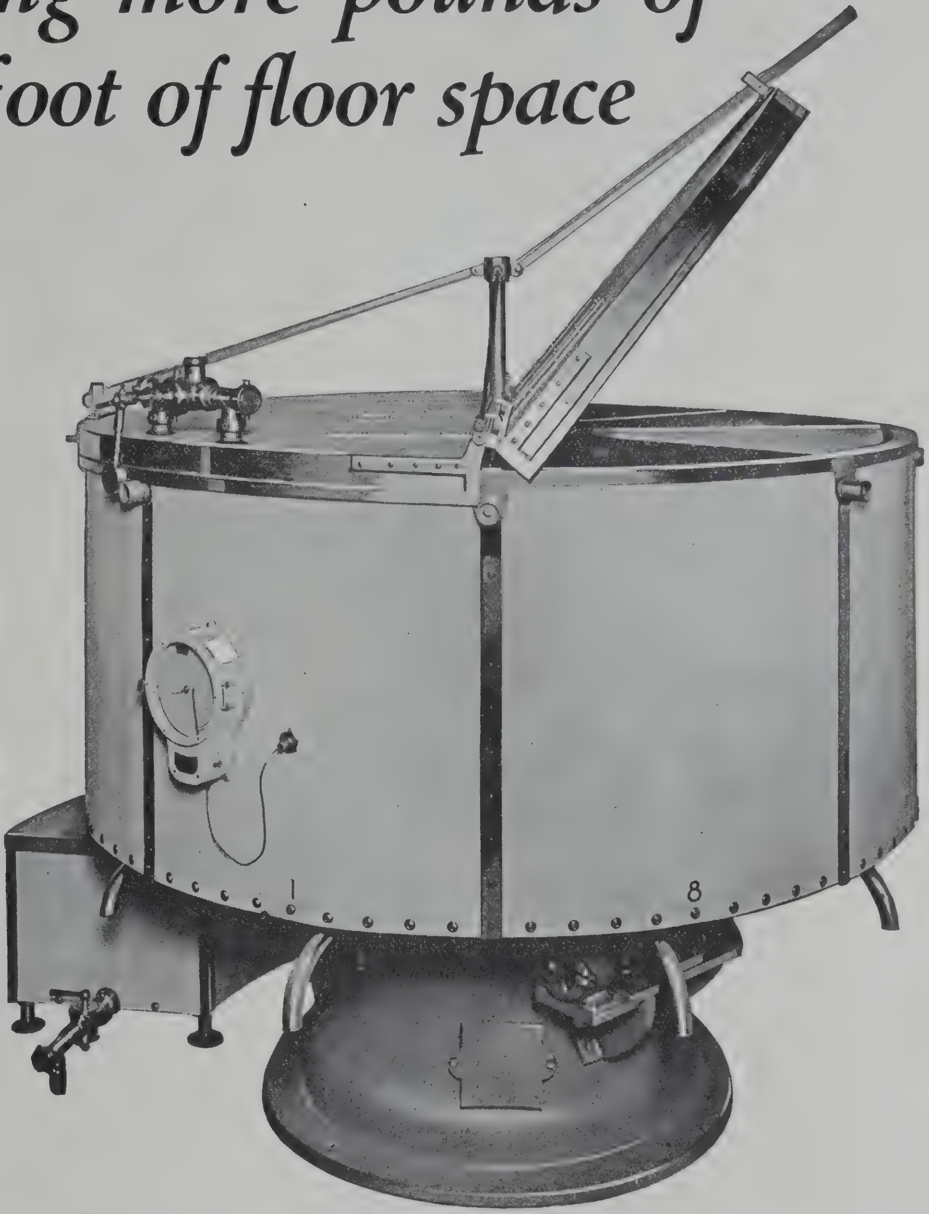
Pasteurizing more pounds of Milk per foot of floor space



Mortensen
Positive Automatic
HOLDER

Within a space of 10 feet square you can automatically pasteurize as high as 20,000 pounds per hour. You can handle this volume with greater facility, less labor and at lower cost.

The Mortensen Positive Automatic Holder is proving its economy and practicability to an ever increasing number of users.

Why don't you, in the interests of plant efficiency, make a thorough investigation of this equipment?

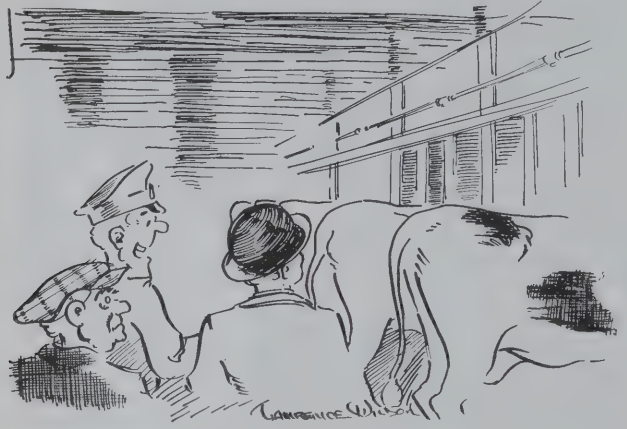
MIKE THE MILKMAN

SHOWING A BARN

The other day I had a chance, by accident, I grant, to give a customer a glance at our new modern plant. That fellow opened up his eyes as wide as oven doors; his face was stricken with surprise, he glowed about the pores! "All this!" he cried. "Is this the way that milk is handled now? I thought the stuff was lugged away directly from the cow! Machinery! Upon my word, all working smooth and true! My, what a journey from the herd to custard pie and stew! It's what? It's pasteurized, you say, and all the germs are killed? And this, you tell me, is the way the bottled stuff is filled? You wash the bottles here? By jove, why listen to me, man! I thought you rinsed them on a stove and dried them in a pan! THIS caps the bottle? Land of plums, great lavender and lace! I thought you use your handy thumbs to push the caps in place! I've seen enough! How things advance! How wholesome, fresh and clean! Say, everyone should take a glance at plants like this, I ween! Yes, everyone who uses milk, who uses milk and cream, should view this plant, as fine as silk from under joist to beam! I'll never be afraid again to buy your milk, I vow, with these machines, some nine or ten, between me and the cow! And for my tots I'll not be scared, no never in my life, for now I see how milk's prepared! Next time I'll bring my wife! Tomorrow leave an extra quart, there's room upon the shelf, and then to show you I'm a sport I'll drink more milk myself!"—J. Edw. Tufft, Grand Forks, N. D.



NEW BUSINESS STATISTICS.

During the past six months 106 new statistical indicators of business have been made available to the public through the "Survey of Current Business," as shown by the August issue of that publication, issued recently by the department of commerce. The total current business indicators now available through this source amount to 1,698, furnished by 111 trade associations, 41 government agencies, 35 technical periodicals and 37 other organizations. The greatly increased interest of business men in the use of such statistics to show the true facts of business has been largely instrumental in obtaining these new data, officials of the department report, and most of the principal industries are now covered by these monthly reports.

New data added to the "Survey of Current Business" during the past six months include the following: Cotton-cloth production, stocks and unfilled orders by groups; trackwork production; cast-iron boiler and radiator data; household enamelware; closed-automobile relative production; electric bookings; electric motors; electric hoists; electric porcelain; band instruments; vacuum cleaners; sales-books orders; barrel headings; cypress lumber; rotary-cut veneer; household furniture; receipts of milk at Philadelphia and Baltimore; Canadian life-insurance sales; and brokers' loans.

These data are all shown in the August issue of the "Survey of Current Business," which contains the semi-annual details and list of sources, covering 160 pages, as well as over 1,500 other business items, all collected under one cover. This publication may be obtained regularly from the Superintendent of Documents, Government Printing Office, Washington, D. C., at the price of $1.50 for a year's subscription.

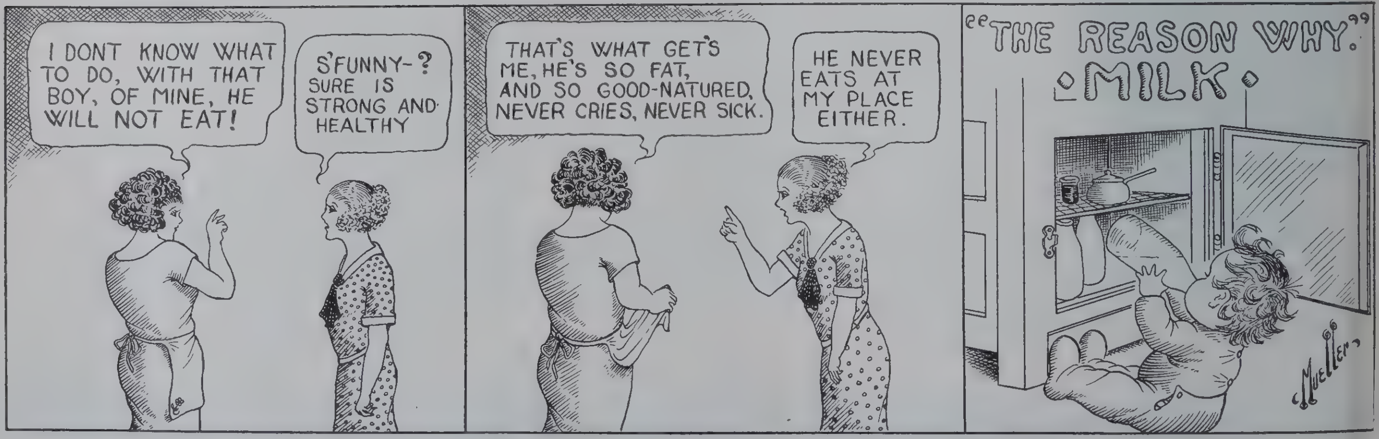
WISCONSIN AND HAWAII INTERESTED IN DAIRY SHOW.

Manager Robert E. Jones reports that he is daily in receipt of requests for entry blanks for exhibits in the Pacific Slope Dairy Show, which is to be held in Oakland November 13 to 20.

In the past week, blanks were sent to cheese and butter manufacturers in Wisconsin and to whole milk distributors in Honolulu, as well as to many others on th Pacific Slope.

"This is the sixth year of the Pacific Slope Dair Show and everyone in the industry is now assured tha the show is a permanent and growing dairy enterprise,' said Manager Robert E. Jones recently. "We are assured by the number of inquiries and requests for entr blanks that the 1926 show will surpass anything of th kind that we have ever had on the Pacific Slope."



I DONT KNOW WHAT TO DO, WITH THAT BOY, OF MINE, HE WILL NOT EAT!

MICHIGAN ASSOCIATION WILL MEET.

Jackson will be the Mecca of the Michigan Allied Dairy Association for their annual convention Feb. 7-11, and plans are rapidly going forward for providing the most interesting program that has ever been given by the Michigan dairy products manufacturers. This association was formerly known as Michigan Dairymen's Association.

According to D. W. Shiel, secretary of the association, it is very important that those who will have an exhibit at the Jackson convention make their reservations at once; inasmuch as those in charge of the convention wish to make their advertising plans accordingly. Floor space will be sold at prices ranging from $18 to $30, this rate to include janitor and drayage charges to and from the exposition hall. Fifty-six spaces are for sale, and according to Mr. Shiel, each will have plenty of light for effective exposition.

The convention will include all of the dairy industries, so that a huge attendance is expected. Within the Michigan Allied Dairy Association, there is an association from each industry, and it is planned that each unit hold their own respective meetings during the course of the convention.

The convention program that has been planned to date, in addition to the business sessions, follows:

Feb. 7.

Placing of exhibits.

Dairy Boosters annual banquet at the new Hayes Hotel.

Feb. 8.

Convention will open at 10 a. m.

A program in the exposition hall will be given in the evening.

Feb. 9.

Michigan Allied Dairy Association annual banquet at the Hayes Hotel, which will be followed by entertainment.

Feb. 10.

Special program by the Jackson City Choral Club under the direction of Prof. S. S. Rockwell.

Annual dance of the Michigan Dairy Boosters. Everyone attending the convention is invited.

Feb. 11.

Winding up of all unfinished business.

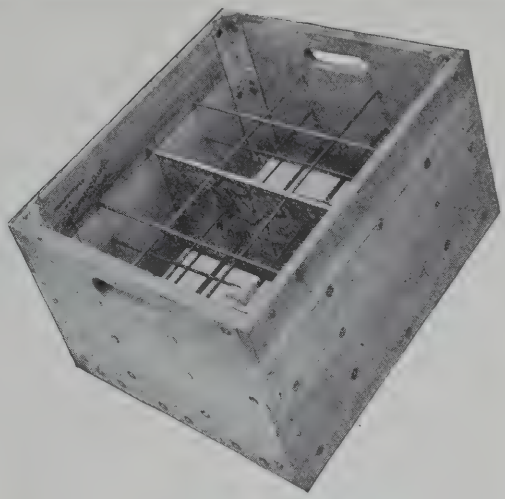
⁂

JUDGE MORRIS FOR GOVERNOR.

Our good friend, Fred Wehmiller, president of the Barry-Wehmiller Machinery Co., St. Louis, calls our attention to the fact that Chas. G. Morris, president of the New Haven Dairy Company, New Haven, Connecticut, is a candidate for governor of his state. At the Democratic state convention, held in New Haven in September, "Judge" Morris, as he is known to his host of friends in the dairy industry, was selected as the standard bearer.

Mr. Wehmiller also calls our attention to the fact that the convention also adopted a platform which reads as follows:

> "The Eighteenth Amendment has no place in the framework of our government. It is an indefensible curtailment of personal liberty. We believe that it should be repealed, and pledge our candidates for office to work for that end. In taking this unequivocal stand we do not countenance non-enforcement. While prohibition is the law of the land it is the duty of our government to enforce it. We oppose the return of the saloon."



Money Savers

You can keep down your bottle crate investment with—

Republic Bottle Crates

and their life of useful service will be found to compare exceptionally favorable to any you have used.

The high one-piece galvanized iron center spacer keeps the rods permanently in line and prevents their sagging. Corners are reinforced with heavy galvanized metal—made in one piece to form stacking iron and bottom corner protection.

CLEVELAND, OHIO

Special Course in Dairy Manufactures

At University of Missouri, College of Agriculture, Columbia, Mo., Jan. 3 to Feb. 26, 1927

INSTRUCTION is offered in all dairy manufactures, including buttermaking, ice cream making, cheesemaking, handling market milk, dairy bacteriology, testing dairy products, dairy mechanics, dairy plant management, and refrigeration.

This course trains men to become buttermakers and cheesemakers, to manufacture ice cream, to receive and process market milk by application of modern methods, and to manage manufacturing plants efficiently.

Who Should Enter the Course in Dairy Manufactures. The volume of ice cream consumed annually in the state of Missouri has increased 300 per cent during the past five years. The output of Missouri creameries has experienced an increase in the volume of butter manufactured of approximately 35 per cent in the same length of time. The market milk plants of this state are each year increasing the volume of their milk sales due to an increase in the consumption of milk and cream.

The demand for thoroughly trained and competent men to accept positions in cheese factories, creameries, ice cream plants, market milk plants, and commercial laboratories has greatly exceeded the number of trained men available. This demand for trained men is becoming more urgent each year. The beginning salary for men with little or no previous experience averages $120 per month. Every graduate of our special course in dairy manufacture for several years has been placed in a satisfactory position. As further requests for more experienced men are received, we never hesitate to recommend our graduates for promotion in position and salary. The purpose of this short course is to give a thorough training in the fundamental principles essential for practical work in creamery buttermaking, ice cream making, cheesemaking, plant management, and the production and handling of market milk. Men who desire to undertake any phase of the dairy manufacturing business, will find this course complete in every respect and a most important stepping stone to better positions. Many of the most modern creameries, ice cream factories, and market milk plants now demand that a man be a graduate of a short course of this nature.

Training Very Necessary and Essential. Success in dairy manufacture now depends on a knowledge of the most modern methods now practiced in our dairy manufacturing plants. So great is the value of dairy products and so dependent is the value on quality, that the efficiency of a plant is measured by the ability of its employees to turn out the largest amount of high quality product from the raw material available. **Trained men,** only, can cope with the varied problems of manufacture, marketing, and business management. The plant manager must be capable of assisting and directing skilled and technically trained labor. These qualifications may be gained through many years of work in commercial plants or by thorough training, such as is secured by attending the Missouri special course in dairy manufactures, combined with a much shorter period of practical experience.

This special short course is designed to teach the fundamental principles necessary for the manufacture, storage, and sale of dairy products, and abundant opportunity is given to become thoroughly acquainted in the university creamery, ice cream and market milk departments, and operating facilities.

Equipment. The university creamery, where all instructional work is given, is supplied throughout with modern equipment. This includes a Disbrow churn, Perfection churn, 150-gal. Wizard pasteurizer, 200-gal., motor driven Cherry pasteurizer with recording thermometer, automatic bottle filler and capper, motor driven De Laval clarifier and separator, and Sharples combination clarifier and separator, also complete testing equipment.

In addition there are available for student instruction modern commercial dairy plants in Columbia, fully equipped for handling market milk, butter, ice cream and cheese.

The ice cream equipment includes a batch mixer, a 50-qt. Cherry ice cream freezer, ice cream standardizer, a Gaulin homogenizer, a hardening room with a capacity of 600 gallons per day, and two modern ice cream mixture emulsors. All refrigeration work is handled by a 16-ton York refrigeration system which is, without question, one of the most completely equipped plants in the West. The ice making plant has a capacity of 1,500 pounds daily and supplies ice for milk cooling at the dairy barn in addition to the needs of the creamery and the ice cream department.

Time. This special course in dairy manufactures will be offered for a term of eight weeks from January 3, 1927, to February 26, 1927. Many students or men employed in the plants avail themselves of the opportunity to take this course which is offered during the season of the year when the demand for their services is the least. Such an arrangement will not require that you resign from your present position. Realizing the vital importance of this course, the managers of many plants pay the expenses of several of their employees who are eager to progress. In the class of 1926 about one-half of the students enrolled had all expenses paid by the company with whom they were employed.

Entrance Requirements. The only entrance requirement is that the student be 16 years of age or older. The special course in dairy manufactures is arranged so that the students who have had no more schooling than that offered by the common schools can satisfactorily do the work. About one-third of those who attend have had no more than an eighth grade education. Many students have had some high school or university training. The work is so broad in its program and the course of study so arranged that those with advanced preparation and experience will find their time fully employed to a good advantage by giving attention and consideration to the more advanced problems.

The Cost of this Course. Students are required to pay a library, hospital and incidental fee of $10. This entitles them to the use of the libraries, and to hospital and medical attention in case of sickness. Laboratory fees totaling approximately $15 are also charged to cover cost of materials used. Most short course students room with private families. The usual cost for each student is from $7 to $11 a month. Many short course students eat at the cafeteria where board may be had at a reasonable figure. The cost at private boarding houses ranges from $5 to $7.50 per week.

Outline of the Work Given.

Ice Cream Making. This includes the manufacture of ices, sherbets, and ice cream; freezing, packing, hardening, sale of ice cream, and the standardization of ice

ILL.

cream mixes for fat, solids not fat, and total solids. Much time is given to solving those factors which tend to cause undesirable flavors, texture, body and color to appear in the finished product.

Dairy Bacteriology. This course is offered because of the demand that dairy plants manufacture products with a low bacterial count, and a working knowledge of the application of sanitary principles must be thoroughly understood by all employees. The manufacturer should acquaint himself with the common types of bacteria and their relation to milk and its by-products.

Judging Dairy Products. The work consists of judging butter, ice cream, cheese, and market milk, and will enable the student to recognize the various grades and their market value.

Dairy Mechanics and Refrigeration. A study of the management, care and operation of power machinery for dairies, including all types of modern plant equipment, and in addition, steam boilers, engines, electric motors and refrigeration plants.

Creamery and Plant Management. This includes a thorough study of the organization, management, and administration of dairy manufacturing and distributing plants. Particular attention is given to the study of overrun, various tests, cost of production of cream, markets, advertising and business methods. A similar study is made of milk, ice cream and cheese.

Tour of Inspection of Creameries, Ice Cream Factories, Cheese Factories, and Market Milk Plants. A trip to Kansas City or St. Louis may be arranged during the last week of the course, for the purpose of inspecting and studying the operation of creameries, ice cream factories, cheese factories, and market milk plants.

For further information concerning the short course in dairy manufactures, write Prof. W. H. E. Reid, Dairy Dept., College of Agriculture, Columbia, Mo.

Several Acknowledgements of the Value of the Course.

"I am now capable of manufacturing a product of which I am proud because I have a thorough knowledge of the fundamentals and their application in addition to the modern processes involved in butter manufacture. Had I not received this information when enrolled as a student in the special creamery course," Edmund P. Mueller states, "I would not have continued in the creamery work.

Before taking the special creamery course, W. H. Miller of California, Mo., was a churn helper; now he is manager of both the butter and ice cream departments.

"Knowledge received in dairy bacteriology concerning the control of bacteria, mold and yeast growth made it possible for me to save the company with which I am associated several thousands of dollars in one shipment of butter to the Alaskan government," write Wm. K. Moseley, who specialized in dairy manufactures at the Missouri College of Agriculture and who is now with the Board of Health of Indiana as assistant supervisor of inspection service.

J. D. Ridgeway of Ollie, Ia., has been able to increase his produce business materially because of his having attended the special creamery course at the Missouri College of Agriculture. He highly recommends the course to any person interested in any phase of butter, ice cream, cheese manufacturing, and the market milk industry.

Glenn M. Young, present manager of the Brookhaven Creamery of Brookhaven, Miss., writes: "During my studies at the Missouri College of Agriculture, I spent a great deal of my time in the dairy department and can say that all my associations with that department have been very pleasant and satisfactory. I attribute my success to the information gained from the courses given by the dairy department."

Bacteria Causing Different Colors in Milk

Not Harmful, But Causes the Consumer to Become Suspicious of the Quality of the Milk

By PROF. W. H. E. REID*

MICRO-ORGANISMS, as known to the dairy industry, are entirely too small to be seen by the naked eye. They remained unknown until they could be observed and identified by the use and application of magnifying glasses or lenses which make up the microscope.

The actual number of different types of bacteria present in milk and its by-products is really astounding were it not for the presence of so many kinds of bacteria. The time, effort and cost of producing and subsequent caring for or handling the milk and the different products into which it is manufactured, would be simple. Therefore, the success of the entire dairy industry is dependent upon our knowledge of the principles underlying dairy bacteriology. The market milkman, with comprehensive understanding and practical, as well as scientific knowledge of how to treat with bacteria in the field of dairying, should be capable of controlling the bacterial flora throughout the various processes involved in producing and afterward handling the milk supply.

The bacteria, as a class, are among the smallest of living things and for that reason they remain quite unknown to the average layman. Their presence is made evident by the changes they produce in the materials and products in which they are growing, as in milk which they cause to coagulate, rapidly deteriorate or produce many other changes.

To the unaided eye, milk appears as a yellowish white, somewhat viscous, opaque fluid with a homogeneous structure. The natural color of milk and its by-products is of considerable commercial value because the consuming public regards this property of milk as a true indication of its quality.

The substance which imparts the true yellow color to milk has been named "lactochrome," although little is known of its real nature. During the summer season milk and butter acquire a very desirable and attractive yellow color, especially when the cows are feeding on green grass. The yellow pigment of the milk fat, which imparts the yellowish hue, is due to the presence of two distinct classes of yellow pigment which are common in green plants and known as carotin and xanthophylls. Experimental work has proven conclusively that dairy cows, exclusive of breed, are entirely dependent on the carotin and xanthophylls in their feed for the pigment of their milk fat which gives to milk its richness of color.

It is common knowledge that milk from the Jersey and Guernsey breeds has a richer yellow color than that from the Holstein and Ayrshire breeds. The Jersey and Guernsey breeds are spoken of as color producing breeds, while the Holsteins and Ayrshires are thought of as non-color producers, due to the appearance of the milk secreted. The question of feed is a vital factor in accounting, in part at least, for a difference in shades of true colors produced by the different dairy breeds. Other factors are also responsible, among which are the changes due to different types of bacteria.

One of the most striking results of bacterial activity is the phenomenon of color production. The particular color which may be produced as a result of bacterial reaction may be almost any one throughout the range of the entire spectrum, though shades of yellow, blue an red are of the more frequent occurrence.

Occasionally it happens that milk assumes a pecu iar color after it has remained standing for a conside able length of time. This change in color is due i most instances to the multiplication of a certain pi ment-forming bacteria. These color-producing organism are almost universally present in milk, but ordinaril do not grow in sufficiently large numbers to impart the peculiar pigment to the milk. Thus, milk at times ma appear blue, red, yellow, or chocolate brown in color.

A knowledge of the color-producing organisms is importance to the producer and distributor of our cit milk supply because of the absence of warning as to ju when the milk may acquire one of these undesirab colors.

The bacteria producing these colors are not relate to each other in such a manner as to form a distin group. The principal property which they have in com mon is their ability to produce their respective pigment or colors, otherwise there is no marked resemblanc This point can be clearly illustrated by stating that yellow sarcina produces a yellow pigment in milk, baci lus prodigiosus produces a red pigment and bacillu cyanogenes, a blue pigment. The pigments, strange state, are not always in evidence even when the respe tive type of organisms capable of producing the pigmen are present, as certain conditions are requred for the fo mation of pigments. Acid is often inhibitory to pigmen formation, as in the instance of the fluorescent pigmen of bacillus fluorescens. The acid which develops milk soon after being produced prevents the formatio of the fluorescent pigment, even though the organism may be present in large numbers.

The blue pigment produced by bacillus cyanogen becomes more intense in color when the acid develo ment occurs, although in this instance the intensity the pigment is probably due to increased growth rath than to formation of a pigment of greater color strengt A metabiosis or relationship which exists between the dinary lactic acid bacteria and bacillus cyanogenes, pigment producer, is responsible for the decided grow of the latter in the presence of acid, rather than in absence of acid.

When these many different colors do make their a pearance in the market milk supply, they appear ne the surface of the milk more so than in the deeper laye This is due to the necessity of free oxygen in the p duction of the pigments or colors by the various p ment-producing organisms. There are, however, exce tions to this understanding, as bacillus cyanogenes for a pigment in the absence of oxygen, although it does velop a pigment under aerobic conditions.

Temperature is a very important factor in the velopment of a particular color, retarding the grow of the bacteria producing the pigment or capable of f nishing the color. At a temperature of 37 degrees (98.6 degrees F.) many of the chromogenic or color-p ducing bacteria do not produce a pigment, while a lower temperature it may be formed in abundan It is of the utmost importance from the standpoint the milk distributor that all of the different color-p ducing bacteria be destroyed before the milk is coo and thus held for an appreciable length of time at a l

Novoid Corkboard Insulation

"The Choice of Careful Buyers"

Greatest Value in Insulation History—

You buy NOVOID CORKBOARD for a much lower price than would be possible were it not for the fact that it is made exclusively in the utilization of "cork waste" by the largest cork products manufacturing organization in Europe.

And since NOVOID CORKBOARD costs no more than competing brands, though superior in six important respects, it is proper to say that its purchase and use offers the greatest value in insulation history.

In no other way could the universal acceptance and prestige accorded NOVOID CORKBOARD — **one board foot per second**—be satisfactorily explained!

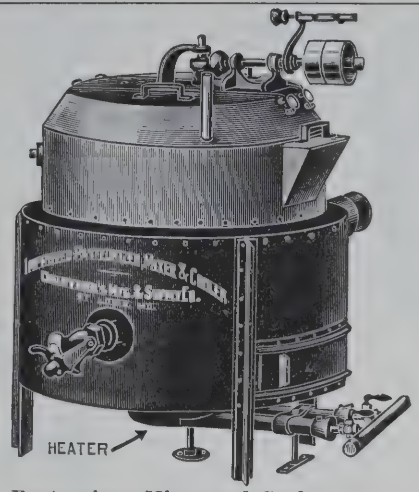
The Dairymen's Gas Heated Improved Pasteurizer, Mixer and Cooler



Gas Heated Pasteurizer, Mixer and Cooler.

THE IMPROVED PASTEURIZER, MIXER AND COOLER is furnished complete with tight and loose pulleys, belt shifter, long stem Brewers type thermometer, which extends down into the center of the milk container, insuring accurate reading of temperature, and sanitary outlet gate and burner. The heating unit is an extra jacket around the outer jacket of the pasteurizer proper made of extra heavy iron, under which a gas heater is placed.

The only machine of its kind not requiring a boiler for heating. Actual tests have shown that the water can be heated to 140° F. in 45 minutes, and is cooled by using ice in the outer jacket.

Capacity gallons	Price without coil, each	Price with copper circulating brine coil, each
30	$215.00	$250.00
50	250.00	300.00
100	315.00	380.00

Price includes burner and long stem thermometer.

Special discount for October.

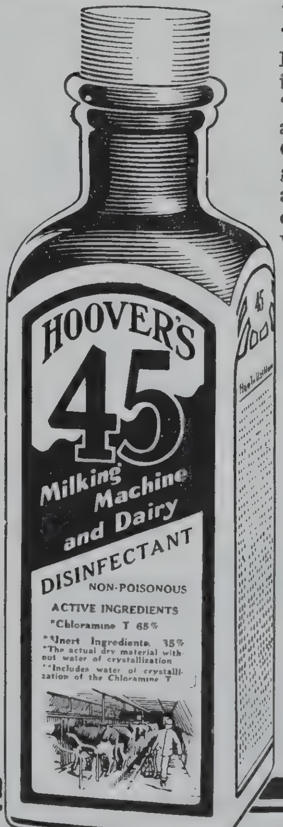
A Powerful, Economical Disinfectant *for* Cleansing Dairy Equipment



Dairies, milk plants, creameries, ice cream factories, etc., find "Hoover's 45" an ideal cleansing agent, disinfectant and deodorant. One 10-oz. bottle will make 475 gallons of powerful solution suitable for flushing out milking machines, cleansing milk cans, milk vats, ice cream freezer cans, etc.

"Hoover's 45" is a non-poisonous white powder that is a germicidally active compound, yet non-poisonous. It is readily soluble in water and its action is very efficient and thorough. Aside from its use as a disinfectant and cleansing agent, it is also a valuable deodorant.

Quantity production places us in a position to offer very attractive prices.

Write for descriptive literature and quotations covering your requirements for a product of this kind.

UNIVERSAL MILKING MACHINE COMPANY
Dept. M Waukesha, Wis.

temperature, if colors in the milk are to be avoided should that particular type of organism be present in the milk.

Light has an inhibitory effect on pigment or color formation, but in an opaque fluid like milk, light is unable to penetrate to an appreciable depth, and pigment bacteria are not materially influenced.

Bacteria have a tendency to rise with the cream, so that the cream layer frequently shows the presence of different colors when the skim milk below has a normal appearance.

Colored milk has never, to the best knowledge of our scientists, been produced by the bacteria that are injurious to health. However, the appearance of colored milk naturally arouses the suspicion of the consumer, and is, therefore, frequently the source of considerable annoyance to the producer and distributor. Colored milk is an annoyance for the additional reason that the milk usually shows no evidence of color when it leaves the producer's or even the dealer's place of business. The pigment furnishing the color usually appears after the milk has been standing for some time, enabling the pigment-forming bacteria to have an opportunity to multiply.

As indicated, the pigment frequently affects only limited portions of the milk. The surface may be uniformly colored; no colored spots appear which gradually expand and coalesce, and finally penetrate to some depth; or the whole volume of the milk is affected; or, finally, the pigment may in rare instances appear in lower portions of the milk only.

There are occasional instances when milk is colored by agencies other than micro-organisms. The presence of blood is not an infrequent cause of a red tint in milk. Milk which has been allowed to stand in iron dishes for several hours may assume a bluish-gray color, due to a solution of some of the iron. Milk from diseased udders may have a decided yellowish tint. Pasture plants which are eaten by cows may influence the milk so as to produce coloration, but observations of this sort are not entirely trustworthy.

Blue color in milk has probably been more frequently observed than any other "color fermentation." Sometimes the blue pigment appears only after the acidity of the milk is pronounced, and becomes more intense as acidity increases. This phenomenon is not due to a chemical influence as much as to the fact that the milk becomes more suitable for growth of the organism when acidity develops. This is an example of an associative effect of lactic acid bacteria and the pigment-producing types. It has been observed that the pigment develops more rapidly in raw milk than in pasteurized milk, and in pasteurized milk more rapidly than in sterilized milk. A blue color develops quite rapidly in pasteurized milk when the milk may curdle promptly. The influence c lactic acid bacteria is quite obvious, since raw milk sour more rapidly than pasteurized milk, and pasteurize milk more rapidly than boiled milk. As a matter of fac boiled milk does not usually sour.

Bacillus cyanogenes or bacterium syenaneum probably the most common cause of blue milk. It ha been found in this country as well as in Europe, an therefore, may be assumed to be widely distributed. Th color is not produced in milk kept at 37 deg. C. The di tribution of the color seems to be more uniform throug the volume in pasteurized milk than in raw milk.

Blue milk has been observed more frequently in sun mer than in winter. It is thought that the feeding c turnips or of clover mixed with horse tail may be th cause of the blue pigment appearing in milk, and that change of food will relieve the trouble. The micro-o ganisms producing the pigment are disseminated b these feeds and consequently they are also present i cow feeds, and may gain entrance to the milk from th source.

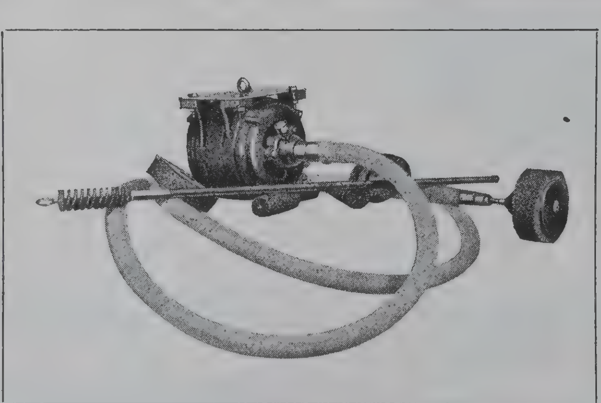
The red pigments or colors develop in milk less ra idly than the blue colors and appear, generally, after lapse of two to three days, which indicates to the co sumer that the milk was delivered in apparently goo condition.

Red milk is probably caused by bacillus prodigi sus more frequently than by other red pigment-formin micro-organism. Usually, the cream alone appears co ored as the bacteria rise with the fat globules. Suc milk is, of course, entirely harmless and objectionab only on account of its appearance.

Bacillus fluorescens, which is a common inhabita of water and feces, and consequently, of milk, has fluorescent pigment, which appears but rarely, since ac prevents its formation. Yellow milk is very uncommo although it has appeared in several instances. Sarci lutea may form a yellow pigment of color in milk, b the pigment settles and does not impart a yellow col that diffuses throughout the milk. This one organis is a small bacillus that coagulates the milk and dissolv the casein, resulting in a lemon-yellow fluid.

The producer and distributor must take every pr caution to safeguard their milk supply against the e trance of pigment or color-producing bacteria. The organisms increase the total number of bacteria in t milk and produce colors which are entirely offensive the consumer and this is particularly true since the mi is the product which is expected to be free of all qu tionable appearances.

A milk supply which is produced under modern, sa itary conditions and carefully guarded in the subseque processes until consumed, will not be troubled by col producing bacteria.

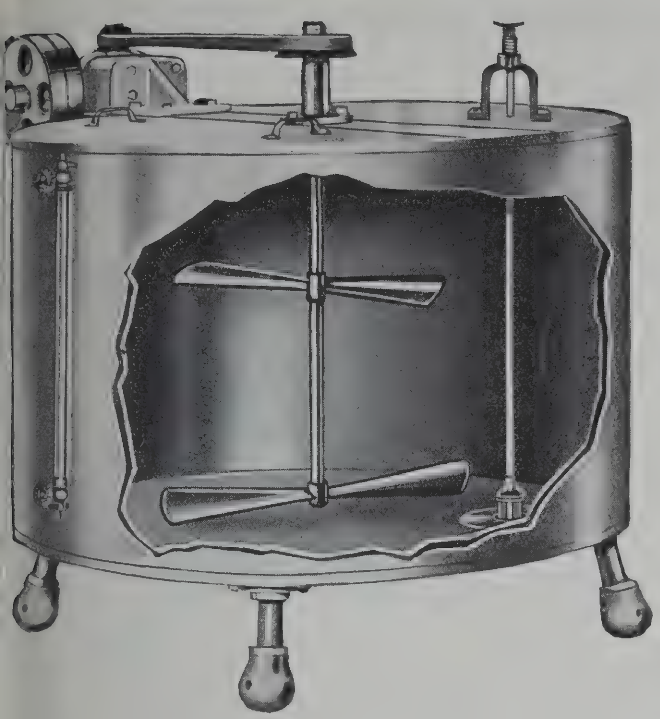


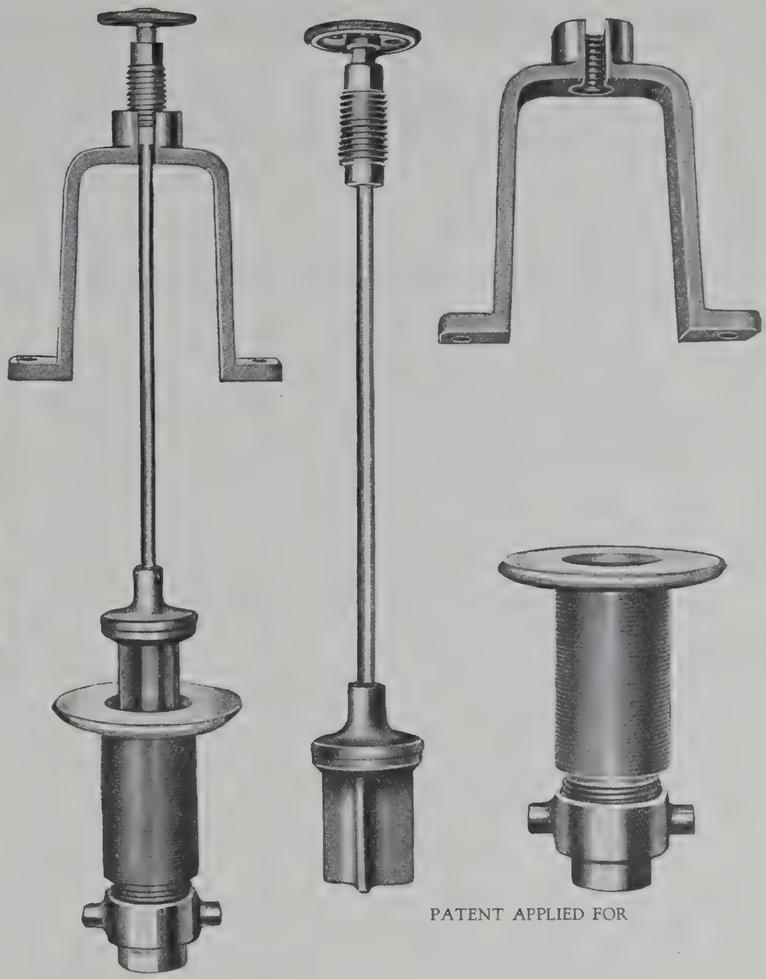
The King Cleaner *vs*. Steel Wool and Harsh Brushes

RESULTS—Both will keep Sanitary Piping and tubular pasteurizing equipment perfectly clean,—but—the King Cleaner will not ruin the tubing, and requires far less time and effort for the work.

Send us diameters and lengths of tubing in your equipment and we will advise you size and price of Cleaner needed.

King Sanitary Pipe Cleaner Co., Inc.
SANDY HOOK, CONN.





The Cresco Flush Valve sets flush against the outlet inside the bottom of the Cresco Pasteurizer. The beveled ground seat makes a perfect fit.

PATENT APPLIED FOR

Cresco Pasteurizer

Outstanding superiority characterizes this economical machine for the perfect pasteurization of market milk. Years of satisfactory service in America's milk plants prove its honest value.

Start with one unit. As your business grows add other units. Economy of operation and long life construction, together with low first cost, make it an ideal equipment for progressive milk men.

The Cresco Pasteurizer insures the full cream line in the bottle, retains the natural raw taste in the milk, and obtains the low bacteria count so necessary in building a bigger milk business.

Ins and Outs of Business Law

How NOT to "Fire" an Employee

By O. H. BRINKMAN, Attorney at Law

"I WANT to get a warrant,'' said the client.

''Who for, what for, and why for?'' queried his lawyer in the casual manner of one who refuses to get excited about other people's troubles. Lawyers do get that way for some reason or other!

''Well, this fellow Joe Spavins, whom I brought into the business when he was just in knee-breeches, has got so that he thinks he knows more about it than I do, and he's going to leave me at the end of the week and try for himself. And he's got my full list of customers, my price lists and my buying records, and I might just as well kiss my business good-bye as let him get away with that stuff. Of course I don't mean to say that Joe would actually take anything that belonged to me, but I know he has copies of everything because I saw him making some of them, and he even had the bookkeeper help him. So I want him arrested, because I know the law won't let him get away with that kind of stuff.''

''True enough,'' replied the barrister, ''but the law won't put him in jail—at least not yet. If and when we get an injunction against him, and if and when he violates it, we might have him committed to durance vile for contempt of court. However, the first question is whether the information he intends to use was gained in confidence, and whether it is a particular secret of your own business and not matters of general knowledge to the trade.''

''Why sure,'' the client said, ''I wouldn't have let Joe or anybody else have the list of my accounts, or our credit records, or any of the other stuff he's been copying, unless it was in confidence. Of course, I didn't have anything in the way of an agreement in black and white with him, but—''

''Oh, that part's all right,'' the lawyer interrupted. ''Joe has been your manager, and even if he had been merely a clerk, the law still implies a duty on his part not to divulge trade secrets. Even if he did not intend to go into business himself, he could be restrained by an injunction from giving a competitor a list of your customers, etc. Even ideas for advertising campaigns can be protected against disclosure to somebody else. And some businesses have operated for years under secret processes, not patented, for manufacture of various articles and compounds, simply because the law protects what we call 'trade secrets.' ''

''Well, the worst is yet to come,'' said Joe's employer. ''He even wants me to give him a letter of recommendation, or a letter saying that he is quitting of his own free will. If I give him a letter, it will be the kind that has to be written on asbestos paper.''

''Well now I know I can charge you a good fee, and with a clear conscience, too,'' was the reply. ''We have a law in this state, and they have practically the same thing in several others, providing that upon request of an employee, either leaving voluntarily or 'by request' the employer shall give him a letter stating the nature and character of service rendered, and the reason for the severance of employment. For failure to do so, the employer can be fined $500, or imprisoned for not more than a year in jail. Possibly the law is unconstitutional, but why take a chance, and spend the money to test i when that can be so easily avoided? Furthermore, fo an untruthful letter written to anyone concerning former employee, where malice can be shown, there i possibility of judgment for libel. Furthermore, if wage or salary are withheld from an employee who is leaving and payment is not made within seven days, the la provides that the man shall be considered as remainin on the payroll indefinitely—until such time as the em ployer does make payment. Of course these laws aren in effect in all states, but in most states there are pro visions designed to 'protect' the employee; and when man quits or is discharged, the best thing to do is t pay him in full and proceed to forget him. This 'gettin even' idea is never profitable, in my estimation.''

''How many more such laws are there?'' asked th client, with considerable asperity.

''Oh, we have one that prohibits blacklisting an em ployee; another that provides a corporation must gi 30 days' written notice before reducing wages, and sti another requiring payment of wages not less than twi a month. The bankruptcy laws gives preference to em ployees for past-due wages, and so on. Then, too, yo can't withhold wages due an employee who quits wit out notice and who has failed to finish a particular pie of work for which he was hired, or on which he w engaged.

''The law, of course, gives the employer protectio in some cases, such as upholding written contracts wit the employee that he will not engage in the same bus ness for himself or others in a certain location for a lin ited time. It also gives you action for damages again anyone who entices away a valuable employee; damag from the employee himself who leaves in violation of contract, and you can even restrain him from enterin the employ of someone else if you can prove that h services require special skill or knowledge not possess by others and which you cannot duplicate. These latt cases are very rare, however. You can also recover fro an employee secret commissions that he may have o tained while engaged in your business, such as a 'rak off' from the firm that has been doing your truckin and the like.

''But all this doesn't worry you just now, and I su gest that you send or bring Joe in, with or without a la yer of his own, and I believe we can straighten the ma ter out.''

The result of the conference was that Joe stayed wi his employed, with a share of the profits, and ever body lived happily ever after—except the lawyer, w had trouble collecting his fee!

SOUTHERN DAIRIES DOES EXCELLENT WORK IN FLORIDA RELIEF.

The Southern Dairies, Inc., operating sixty or more creameries and ice cream plants throughout the Southeast, with the main office in Washington, D. C., established an enviable reputation during the recent disaster in Florida. This company operates four plants in the storm area: At Miami, West Palm Beach, Ft. Lauderdale and Sebring, but, fortunately, suffered very little property loss due to the steel-concrete construction of the buildings, two of which have been completed within the past year at a cost of over a million dollars.

When the Washington office of Southern Dairies received word of the hurricane Col. VanAken, director of manufacture, left immediately to supervise the company's work in the storm area and arrived at Miami Monday morning, September 20. He found the conditions in that city were very bad but that relief work had been started and was just getting under way. There was no light and power in Miami nor in the surrounding country, food was scarce and there was fear of an epidemic because the water supply had been cut off or contaminated.

On Sunday (the day after the storm), Southern Dairies put two cars of milk, cream and butter into Miami from Selma, Ala., routing them by way of Jacksonville. This shipment was the first relief to reach the stricken city and preceded, by almost a day, the relief trains sent by the citizens of West Palm Beach and Jacksonville. By special order of Mayor Romfh, Southern Dairies' was the first plant of any nature in Miami to receive light and power and by four o'clock Monday afternoon it was in full operation.

All employees of Southern Dairies were given special permits to pass police, military and Red Cross lines and the delivery of milk was started Monday evening. Considerable quantities of milk were also put into the general relief channels through the Red Cross and other agencies and the company supplied, at their posts, the police and military guards who had been on duty continuously for two days.

The Miami plant also released thousands of milk cans for use in bringing drinking water from West Palm Beach and other nearby places.

Although the local supply was reduced 50 per cent, Southern Dairies co-operated with the other dairies in Miami, pasteurizing and bottling enough milk for them to supply their regular customers. In addition, Southern Dairies donated large quantities of milk to the Red Cross and other relief organizations and took care of its old and 2,000 new customers who called upon them for service. The plant worked day and night and people came there by the hundreds to obtain milk.

On Tuesday, September 21, a special crew was sent by the Pennsylvania Railroad from York to the Southern Dairies' creamery at Hanover, Pa., to be loaded with milk and was returned in time to catch the fast baggage train for Jacksonville that same day. This car arrived in Miami on the twenty-fourth, after traveling about 1,350 miles, and aided materially in supplying the milk needed by that city. This car was 30 per cent over-iced so as to insure the contents remaining in good condition for twenty-four hours after the arrival in Miami. Southern Dairies sent at least one car of milk into the devastated area from their creameries in Selma and Montgomery, Ala., Woodstock, Va. and Hanover, Pa., every day since the hurricane, thus assuring an adequate supply.

In the vicinity of Sebring, considerable damage was done, but the Southern Dairies plant escaped and was able to care, in a great measure, for the refugees from Moore Haven and other nearby towns which were entirely wiped out. Col. VanAken arrived in Sebring on Wednesday, the twenty-second, and in spite of the stric military supervision of the single, working telegraph wire out of that town, Southern Dairies prevailed upon the authorities for its use and a car of milk came int Sebring that night on the first passenger train to arriv from West Palm Beach. This milk was sorely neede and was deeply appreciated by the residents and th homeless refugees who fled here.

The hurricane gave Southern Dairies a chance to abl demonstrate that it is a well directed, efficient organization that could not be adversely affected by a seriou local condition but could rise above it and, because of it expensiveness, continue to deliver, uninterruptedly, hig grade dairy products throughout the entire southeaster section of the United States.

* * *

FORMAL OPENING OF ALABAMA PLANT.

Formal opening of the new plant of the Montgomer Dairy Products Co., a branch of the Southern Dairies located at Montgomery, was celebrated early in Octobe with a barbecue and refreshments. Invitations wer issued by L. T. Wells, manager, and the general publi was welcome to make an inspection tour of the moder plant.

The new plant is said to be one of the most moder milk and ice cream plants in that section of Alabam and is the third to be located in Alabama by Souther Dairies. The other plants of the company located i that state are at Selma and Birmingham.

STIMULATED INTEREST IN BETTER CREAM.

Quality cream is in demand. The milk plant uses it, the ice cream factory needs it and the creamery requires it. Its acquirement may spell success or failure. So the struggle for quality cream continues. But how secure it?

Two words answer the question: Education and grading.

While the grading of cream may be defined as the application of constructive selection to industry, it is sometimes lacking in practicability. On the other hand, education may fail for want of the "after punch" to sustain interest.

Some of the winners in the dairy products exhibit at the 1926 Oklahoma Free State Fair at Muskogee. Note the five gallon can of hand separated cream. The hand separated cream class has stimulated considerable interest in cream improvement in and about Muskogee. The shepherd boy and dog are modeled out of butter.

Therefore, any idea to help sustain that interest is well worth considering. Such was a plan credited equally to officials of the Oklahoma Free State Fair Association at Muskogee and to two intensely interested competitive creamerymen of the same town.

Someone suggested a sour cream exhibit, with plenty of cash for premiums. The idea went over "big" and the plan, let us call it the Muskogee plan, fostered largely by the secretary of the fair and the two creamerymen, R. W. Brice and C. E. Kerns, continues to grow.

That was two years ago. The state fair catalog came out offering attractive prizes to the twelve highest scoring five-gallon cans of hand separated cream. Sixty dollars in premiums were offered; certainly an inducement to say the least.

An entry list of some forty cans was expected, but the unexpected happened and one hundred and fifteen entries arrived.

Hand separated cream; sour cream. I wonder how many of our readers appreciate the full meaning of the term? To some, sourness is only relative. To me, it now signifies exactly what it spells.

But the cream wasn't only sour; some was sweet and some combined other flavors like high acid, bitter, rancid, cheesy, musty, oily, stale and yeasty. Yet, requirements demanded that it be tasted.

Likewise, the texture was noted. Greasy, crumbly, mealy, grainy, thin, and thick were among the common defects.

To complete the placings, the fat content was considered. For our purpose a full score was allowed if the test ran 35-45 per cent.

Selection of the best cans was made according to a process of elimination, and it was interesting to note that, with one exception, the twelve highest scoring samples were in new, bright, shiny, clean smelling cans.

One month following the contest reports were sent to each exhibitor, with a personal letter telling wherein his entry was deficient and how it could be improved. An invitation was also included for a next year's "return engagement."

Apparently the invitation was heeded, for 135 entries were on the secretary's books at the opening of the 1925 fair. And entries were not the only thing that increased. The amount of quality cream was almost trebled. It was smoother in texture, cleaner in flavor and decidedly lower in acid. It was evident that suggestions for cream improvement had not only been noted, but had actually been carried out.

Needless to say the venture was a success. The two competitive creamerymen demonstrated the value of friendly co-operation. They stimulated interest in the project; they gave their time to assisting each other in entering patrons as well as non-patrons, and they stored the cream until the judging date. As a result both plants profited by securing a better quality cream and turning out a correspondingly better flavored butter. That I can vouch for after several years experience as judge of dairy products in Oklahoma fairs, as well as in some other states.

As for the Oklahoma Free State Fair Association, this organization, judging by the outcome of the dairy products exhibit, is one that is doing its part in helping solve present day dairy problems.

Why not every state fair a party to the good cause?

A. D. BURKE.

IT'S YOUR AIM THAT COUNTS.

By Vernon Varney.

You may have a good gun
And the best bullets in it,
But without a good aim
Could you hit a tame linnet?

You may have a good bow
And the best balanced arrows,
But without a good aim
What harm to the sparrows?

You may have two good hands,
And a brain that's O. K.,
But with no aim in life
Can you win Bradstreet's AA?

Oh, it isn't the weapon
That wins you the prize;
It's the aim that you take
That hits the bulls-eyes.

Aim straight and aim true
At the mark you would win,
Then laugh at the handicaps
Fate has thrown in.

For the best equipped man
Will but fall in his tracks
If his aim has been faulty,
His purpose grown lax.

While the fellow who keeps
His aim in life level
Will WIN — though he START
With a PICK AND A SHOVEL!

NEW CALIFORNIA PLANT OPENED FOR BUSINESS.

Last year an earthquake all but destroyed Barbara, Calif. The earthquake shook a good many things, but it did not shake the faith of the men back of the Los Angeles Creamery Co., a company serving over 75,000 homes daily, in their community. The fine new plant at Barbara is striking to their faith.

The last issue of "The L. A. Lily," their house organ, carries a story about the opening of the new plant from which we quote as follows:

> Amid the tinkling of Spanish guitars and the smiles of pretty senoritas, the new Santa Barbara plant of the Los Angeles Creamery Company was opened August 28.
>
> The Spanish effect was occasioned by the fact that the opening was held during Santa Barbara's Spanish Fiesta, when most of the residents were in costume and the city was gaily decorated.

NGELES CREAMERY CO

Part of the crowd that visited the new Santa Barbara plant on its opening day, August 28, 1926. In the foreground can be seen the Spanish orchestra retained by the L-A to regale the visitors. At the left of the photo can be seen a chubby Senor and his smiling Senora, who are familiar to members of the L-A family. These foreigners couldn't speak a word of English, but my how they could eat! They were disappointed at not finding hot tamales being served, but were finally satisfied with Lily Brand baby bricks. George Bailey (at the extreme left) got a sore arm from handing victuals to these hungry foreigners who "crashed the gate."

Crowd Estimated at 3,000.

> Judging from the number of Lily Brand baby bricks and bottles of milk and buttermilk, to say nothing of the Lily Brand cheese, that was given away, it was estimated that fully 3,000 people visited the plant at its openng.
>
> A good number of these were in costume, which, together with the decorating of the building and the Spanish orchestra hired for the occasion, made the whole affair very colorful.
>
> The Spanish orchestra in costume had been engaged to entertain the visitors. Some of them succumbed to the catchy melodies and danced on the broad paved driveway. Street dancing was one of the features of Santa Barbara's Spanish Fiesta and the L-A visitors did not overlook an opportunity to enjoy themselves whenever the orchestra struck up a tune.

Many Enjoy L-A Products.

> The Fiesta started on Thursday, August 26, two days prior to the opening of the plant, and the L-A did not overlook the opportunity for advertising among the thousands who thronged the streets of the Channel City.
>
> Arrangements were made for the serving of Lily Brand baby bricks to all who visited the old Spanish galleon anchored off the wharf. This galleon played an important role in Thursday's pageant and was thrown open to visitors on Thursday evening and all day Friday and Saturday.
>
> On Friday, August 29, permission was received from the chief of police to place a freezer at a prominent corner, where there was a large crowd enjoying street dancing. George Bailey, manager of the Santa Barbara plant, and two pretty misses in Spanish costume, passed out 1,500 baby bricks to the dancers in hardly an hour's time.

Sanitation Featured in Plant.

> It is difficult to express in words the wonderful sanitation features of the L-A's new Santa Barbara plant. One trip through the building and grounds makes us mighty proud that we are connected with so progressive a company.
>
> Highly glazed tile covers the walls and even ceilings of the milk receiving room, pasteurizing room and bottling room.
>
> Plate glass partitions permit the public to view the pasteurizing and bottling of the milk.
>
> The plant has a Permutit system that provides soft water for the bottle-washing machine and boilers.
>
> Four large refrigerated rooms assure ample storage facilities.
>
> There is an abundance of windows, providing plenty of sunlight. Particular attention has been paid to the matter of ventilation, the building being arranged to secure a constant circulation of fresh air.
>
> The plant is situated on more than an acre of ground. It has a cemented yard, on which the garages are built. A large, well-kept lawn adjoins the yard.
>
> No horse-drawn vehicles will be used in the operation of the plant. Deliveries will be made by a fleet of ten motor cars.

Will Retail Milk.

> The new plant will enable the company to go into the retail business, which field it entered September 1.
>
> Only milk, cream and buttermilk will be sold on the retail routes. A-Dof-Lus will be added later. The sale of L-A butter and cheese will be confined exclusively to grocery stores, as in the past.
>
> In discussing the company's retail activities in Santa Barbara, employees of the L-A are urged to impress upon their listeners that butter and cheese will NOT be sold on the routes.
>
> For more than twenty years the L-A has sold these products through the grocers of Santa Barbara, and it is intended to continue with this policy.
>
> George R. Bailey, who has been connected with the Santa Barbara branch for several years, is manager of the new plant. He is a brother of W. D. Bailey, manager of the San Luis Obispo plant.

let's BUILD see Webster- a motor!

TRADITION
PROGRESS
THE LINC-WELD MOTOR

—*for the Dairy Industry*

Here lad, the brine pump is out of commission again and we're held up right in hot, humid weather. You've had too many shut-downs in the plant this summer—whose fault is it?

Yours, pop . . . .

Our pumps, ventilators, washers, refrigerators and elevators are all new—all good—all representative of the best practice today—but you crabbed my game for the best non-stop plant in America when you dragged in that old crony of yours and told him and me that his motors were to drive our model plant.

His is a good old company, neatly bound by stiff-backed traditions, but not a motor *specialist*, and not willing to alter design to meet industrial progress until long after the procession has passed.

Primarily the Linc-Weld motor is particularly suited to the dairy industry.

Aside from its fine operating characteristics it is the one motor that is thoroughly waterproof—not moisture proof—but waterproof—it will run when completely submerged in water—the trademark of the Linc-Weld is a motor running under water.

Due to its specially developed insulation worked right up into the slots, you get two factors which work against shut-downs.

(a) Thorough proof against moisture.
(b) Age-long proof against drying-out and cracking.

Write for that illustrated book which gives you the qualities a motor should have in order that a dairy plant can *keep* running—economically.

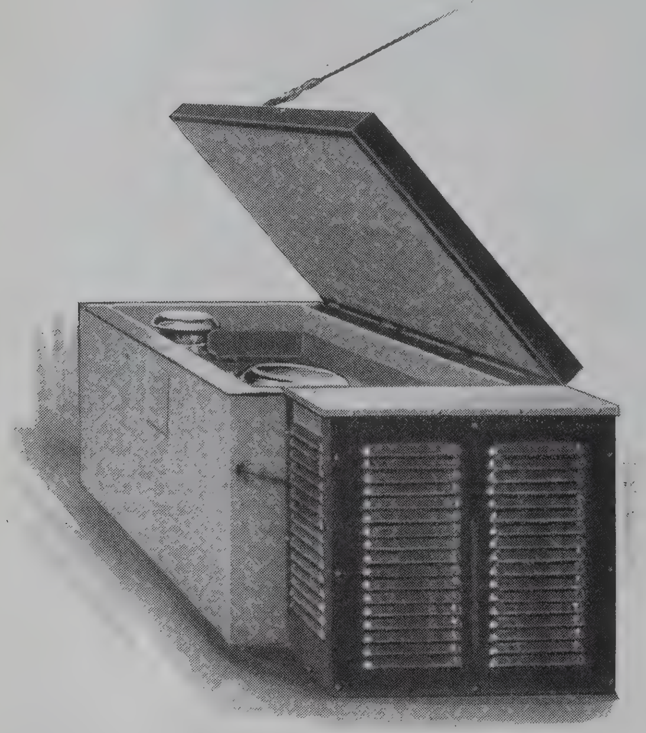
ELECTRICALLY REFRIGERATED MILK COOLER.

Dairymen can now construct a home built electrically refrigerated milk cooler with little trouble. Such a cooler is offered by Frigidaire Corporation.

Plans for the cooler were worked out for owners of small dairies who wanted an inexpensive installation which would fit their requirements. Construction of such a cooler which will accommodate six 10-gallon cans should cost less than $500, including the electric refrigeration units.



As shown in the accompanying photograph, the farm cooler is constructed of cork and concrete and uses a commercial air or water cooled electric refrigeration unit. A cooling coil is placed at one end of the tank, which is filled with water.

Operation is simple. Milk as it comes from the cows is poured into cans which have previously been sterilized. These cans are then placed in the cooler which contains approximately 150 gallons of water at temperatures varying between 35 and 40 degrees F. After the milk has been reduced to 50 degrees, the electric refrigeration system will maintain this temperature until the cans are removed.

Interior dimensions of the six-can tank are, width 30 inches, depth 24 inches, and length 63 inches. Approximately 63 square feet of cork board, seven sacks of cement, 11 bushels of sand, and 21 bushels of gravel or half inch stones are required. The tank is so constructed that a continuous insulation of cork board rests between two layers of cement. A galvanized iron tank lining is placed inside to counteract wear and tear from the metal cans. By following carefully prepared instructions, construction work will not be difficult.

Two copper tubes connect the cooling coil in the tank with the compressor, which can be placed in any convenient spot. The local dealer in electric refrigeration equipment will take charge of its installation and see that units of proper size and type are used.

A factory built milk cooler is also offered. It is equipped with an aerator for use in larger dairies where pre-cooling may be used.

DIVCO TRUCK FOR MILK DEALERS.

An innovation in the milk industry for delivery is a truck controlled and manufactured by the Detroit Industrial Vehicle Co.

The new truck is unique in that it can be controlled from the seat or from the running board, in the same manner as the horse driven milk wagon. The capacity of the truck is 50 cases, with added room on the top of the truck for an additional ten empty cases.

The Divco truck, as it is called, has been designed with the thought of economical operation of foremost importance. It has a four-cylinder governed motor capable of attaining a speed of 18 miles per hour. The manufacturers of the Divco point out that one of the strongest points in connection with its use will be the elimination of branch plants, which is made possible by the speed of delivery in this type of truck.

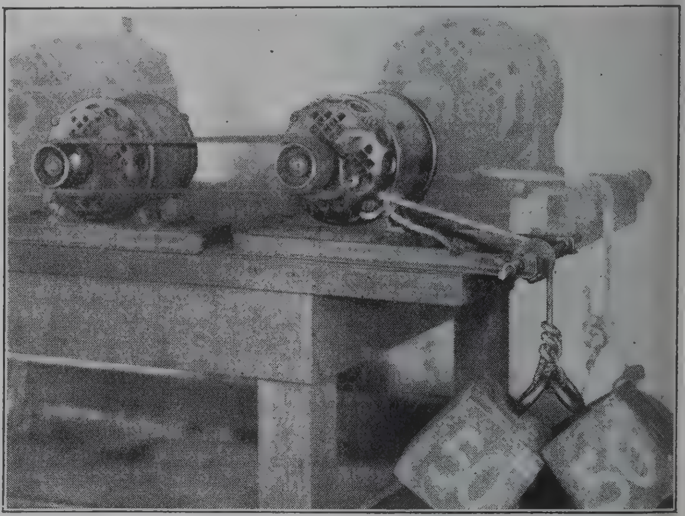
ELECTRIC MOTOR IN UNUSUAL TEST.

An interesting experiment was conducted by the Century Electric Company of St. Louis, manufacturers of the Century Motors. Two ¼-horsepower Century Repulsion-start Induction Single-phase motors, one driving and one driven, belt connected under exceptionally heavy belt tension were run under test at full speed for a total of 18,384 consecutive hours, and are still running. This is a total of 766 24-hour days. These were run with about two and one-half times normal bearing pressure and, according to the company, show no trace of wear on shaft or bearings. The bearings were cast phosphor bronze and the lubrication is the wool yarn system. Oil wells contained only the oil held in suspension by the wool yarn. Holes drilled in the bottom of each oil well allowed escape of excess oil, none being added since the test was started.



Century motors are manufactured in sizes from one-eighth to 40 horsepower, and are adaptable to all kinds of equipment, including electric refrigerators, ice cream cabinets, pumps, oil burners, etc.

SANITIVE BOTTLE SEALING MACHINE.

A new automatic bottle sealing machine is now on the market, manufactured by the Lakewest Corporation, a division of the American Machine & Foundry Co., Brooklyn, N. Y.

The new machine which is made in both the small hand size and the large automatic size, seals milk bottles in a manner that is highly sanitary, for not only does it cover the mouth of the bottle but also covers and seals the entire lip.

The seal is a five-ply paper which is chemically treated

HANSEN SAFELY REACHES DETROIT.

O. I. HANSEN.

Co-incident with the announcement that O. I. Hansen has recently joined the sales staff of Mojonnier Brothers, milk engineers of 4600 West Ohio St., Chicago, Ill., comes the report that Hansen arrived safely at the Detroit convention of the Dairy Industries Exposition.

Mr. Hansen was in a serious motor mishap while driving from Chicago to Detroit, and was badly shaken up and bruised. He was taken from the scene of the wreck and returned to a Chicago hospital, but recovered in two or three days and was seen at the convention with his well-known genial smiling countenance, though, to be sure, he sported a cane and wore a slight limp.

Mr. Hansen is well known in our industry, having been connected with the Creamery Package Manufacturing Co. for five years, and before that time having served the Diamond Crystal Salt Co. In his work with Mojonnier Brothers, Hansen will work in Wisconsin, Michigan, and sections of the city of Chicago.

* * *

SIR ALFRED MOND SPENDS A MONTH IN "THE STATES."

Sir Alfred Mond, chairman of the board of the Mond Nickel Co., Ltd., London, Brunner, Mond & Co., London, Victoria Syndicate, Ltd., of Canada, Henry Wiggins & Co., London, and the Amalgamated Anthracite Co., Swansea, South Wales, has returned to England, after a month's visit in the United States and Canada. During this trip Sir Alfred, accompanied by Robert, Emile and Philip Mond, also of the Mond Nickel Co., visited the company's ore properties in the Sudbury area of Ontario, the smelter at Coniston, Ont., and the recently formed subsidiary for the United States, the American Nickel Corporation, Clearfield, Pa.

The subsidiary company, using Mond nickel, produced under the process developed by Dr. Ludwig Mond about 1900, is entering into the manufacture of nickel products, including rods, bars, sheets, tubes, wire and castings of 99 per cent pure nickel, as well as 70 per cent and other alloys. Among the more highly manufactured products of the company are pure nickel condenser tubes and turbine blades, and a line of domestic utensils for use in large institutions as well as the average household. Sir Alfred points out that while cooking equipment of pure nickel has been in use in European countries for many years, its use in the United States has been limited. It is also intended to manufacture large pure nickel equipment for use in the pasteurization of milk and for similar purposes.

In addition to his connection with various British companies, Sir Alfred Mond has been a member of Parliament for the past 20 years and was minister of public works and later minister of health in the coalition cabinet during the war.

WINDEMERE PRIZE WATCH AWARDED TO GEORGE SAMPSON.

To George Sampson of the O. J. Weber Co., Los Angeles, Calif., goes the honor, glory and satisfaction of winning the beautiful watch which was offered by the Windemere Products Co. of East Cleveland, Ohio, to the salesman who sold the greatest quantity of their rubber aprons.

This contest closed during the Dairy Products Exposition at Detroit, and attracted a great deal of interest during the progress of the show. The watch was on exhibit at Detroit and Mr. Sampson is certainly a lucky man to be rewarded so handsomely for his efforts and sales ability. His total was 432, and his nearest competitor had but 180 to his credit, showing the large lead which Sampson garnered.

* * *

MILK PASTEURIZED IN BOTTLE.

As an added attraction to the Barry-Wehmiller Machinery Co. booth at Detroit, milk pasteurized in the bottle by the New Haven Dairy Co., a subsidiary of the Eastern Dairies Co., was shipped to Detroit and served at the booth of the St. Louis machinery manufacturers.

The milk was pasteurized by the use of the Barry-Wehmiller machine, and although five days old when it was served, it was in perfect condition and received the commendation of the Detroit health authorities who visited the exhibit.

F. J. BRESNAN. L. H. EVERS. M. A. AKIN.

Leffel CREAMERY BOILERS

Save Time Labor Fuel

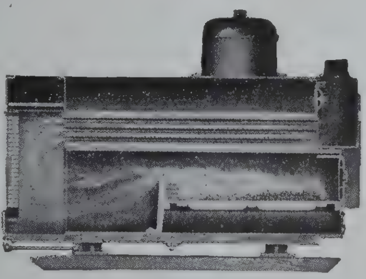
A tremendous saving in fuel costs at your plant, can be effected by using Leffel Creamery Boilers, because they get double service from every pound of coal used.

The hot gases are **compelled** to travel twice the length of the boiler through water surrounded passageways.

Even the ash pit is surrounded by water, thus utilizing every possible heat unit to produce steam.

Because of this highly efficient application of heat, owners save 30 to 50% in fuel costs.

In all sizes 6 to 150 H.P.—workmanship and quality guaranteed—will meet all state boiler laws.



Full description and prices on request.

SCHWAGER WITH NEW SERVICE CORPORATION.

Charles F. Schwager, Omaha, Neb., formerly general manager of the Alamito Dairy Company in that city, now heads the Service Sales Corporation, 354 Omaha National Bank Building.

Mr. Schwager has been very successful in building up "sick" milk plants, his latest success along that line being the Alamito business. Three years ago he took hold of the business after it had passed into the hands of a receiver. He paid off old obligations, reduced operating expenses over $60,000 per year, and left the business on a sound basis and with bright prospects for the future.

Through the Service Sales Corporation Mr. Schwager offers his experience to the trade.

Co., Milwaukee, Wis., announces recent installations of the Meyer Dumore Junior bottle cleaner in the following plants: Burr Creamery Co., Glendale, Calif.; Pinellas Dairy Co., St. Petersburg, Fla.; Glenview Dairy Co., Chicago; National Milk Co., Chicago; Rabe Dairy Co., Elmhurst, Ill.; Standard Dairy Co., Maywood, Ill.; Hammond Dairy Co., Hammond, Ind.; Hamtramck Creamery, Detroit; Kroger Grocery & Baking Co., Cincinnati, and Slate Hill Milk & Cream Co., Slate Hill, N. Y.

* * *

A DEPARTMENT OF DAIRY ENGINEERING AND DAIRY ARCHITECTURE.

Officials of The Dairy Laboratories, Philadelphia, have announced the formation of a new department, the Department of Dairy Engineering and Dairy Architecture.

This has been accomplished by adding the services of a dairy engineer with large technical and practical knowledge and of an architect of unusual ability, both these men having had excellent experience in the design, layout, construction and equipment of dairy plants. They will be assisted also by the present large staff of technical and practical dairy experts.

Steadily increasing competition in the dairy industry, greater exactions by boards of health, the necessity of keeping operating costs as low as possible, in the face of increasing costs of construction and equipment, labor, etc., and at the same time of improving the quality of milk and its products, along with many other vital considerations, have brought about an acute need for expert knowledge in the design and construction of the plant and its equipment.

Officials of the company believe, therefore, that they can materially increase their service to the industry which they have served for over sixteen years, by offering and assuring expert practical knowledge to all who have new plants to build, old plants to remodel or enlarge, or engineering problems of any kind to solve.

Further information on request, addressing The Dairy Laboratories, 23rd and Locust Sts., Philadelphia.

⁂

If that business of yours does not suit you, somebody else will be glad to get it. Let them know about it through a "Milk Dealer" Want Ad.

CULTURES

:·: National Golf Tournament :·:

The national golf tournament of the Dairy and Ice Cream Supply Men's Association was held in Detroit, Saturday, October 9, at Hawthorne Valley Country Club. The weather was ideal.

Those who participated in the tournament include L. B. Swift, J. H. DeVisser, J. Ely, L. T. Meyer, H. Weil, A. R. Sanna, C. A. Gould, H. Black, L. B. Esmond, C. B. Dalzell, C. Bates, C. Krulein, R. Ryan, J. A. Wise, H. B. Dowell, G. W. Getters, D. M. Taylor, H. H. Evans, H. R. Chandler, C. A. Luckenbach, C. M. Anderson, Jos. Graaing, John W. Ladd, L. H. Payne, H. L. Neumeister, A. MacDougall, C. Blake, Mrs. A. MacDougall, H. A. Morris, W. L. Johnson, F. E. Boyd, A. D. Shaefer, G. S. Woodford, E. J. Smith, E. M. Holmes, P. Howes, C. W. Ebling, A. C. Henry, C. B. Harpster, W. W. Lapham, Carl Sielaff, E. Risdon, R. Risdon, E. O. Kayser, O. M. Jeffries, R. E. Howell and Mrs. E. Holmes.

Honor prizes were won by A. C. Henry, Carl Sielaff, E. O. Kayser, W. W. Laphan, R. Risdon, E. Risdon, C. W. Ebling, C. Bates and E. C. Holmes, representing the manufacturers. The supplymen who won honor golf prizes include L. B. Swift, J. Ely, H. L. Neumeister, H. A. Morris, C. Blake, S. Casler, L. H. Payne and A. MacDougall.

After the players came in from the course luncheon was served in the main dining room and immediately thereafter a special putting contest was held on the green. The putting contest was probably the most amusing event of the day. Special balls were provided and given to the players as souvenirs. First and second prizes were won by G. L. Woodford and C. B. Dalzell.

Another contest supposed to be for championship driving was won by H. A. Morris, first, and L. T. Meyer, second. This event consisted of driving a "floater" out of a tank of water. No extra charge was made for the bath.

A real approaching contest was won by A. MacDougall, first, and C. B. Dalzell, second.

The prizes consisted of eight cups, three cigarette cases, three MacDougall putters, five dozen red golf balls, six dozen Dunlop golf balls, one gold medal, one knife and chain, two flasks, one combination cigarette and match box, one fountain pen and one cigarette box.

The committee in charge of the meet was John W. Ladd, chairman, assisted by Lewis Frank, E. C. Holmes and A. C. Henry.

⁂

ALTOONA PLANT IS IMPROVED.

The public of Altoona and vicinity were invited to nspect the modern plant of the Morrison Cove Co-operative Association, located at 1115-19 Twentieth Ave., Altoona, Pa. A number of changes in the dairy plant have just been completed, bringing it to a modern standard in safeguarding the health of the consumers n pasteurizing and bottling milk. The installation of he new equipment made necessary the erection of a wing, 22 by 22 feet.

Carl S. Taylor, general manager, arranged that the demonstrations included the entire process of pasteurization and bottling of milk so that the association's patrons and the general public might know the sanitary safeguards that surround the supply of milk furnished.

A CONNECTION THAT PAYS!

The Milk Dealer, in choosing a partner, should select one who knows the three essentials of conducting a profitable business. These are:—

1. To turn out a uniform, high quality product day after day.

2. To know the correct cost of running the various departments of the business, where to look for leaks and how to stop them.

3. To have real sales ability so that routes are kept well loaded and new routes constantly added.

All these qualifications are hard to find in a single individual. They are present and waiting for you in the National organization built up by Fink and Paine, Inc.

After years of experience in serving scores of dealers, Fink and Paine, Inc. have entered the field of milk plant ownership. Already our experience in operating dairies is showing excellent profits in plants where we are part owners.

We seek more of these openings. If you want a partner of excellent character and proven ability—a partner with a vital interest at stake—a partner able to supply extra capital, if necessary—one who will take hold of your business with a vim and make more money for you than you have ever made for yourself—then write, without obligation, for an interview with one of the principals of our organization.

"PLEASE PASS THE MILK."

To assist in maintaining the health of its employees and to relieve the between-meal fatigue that comes from laboring over machines and desks, the Gisholt Machine Co. of Madison, Wis., has started distributing milk twice each day to its workmen.

The scheme is an experiment, having been started 10 days ago in the main works of the company at Baldwin St. and E. Washington Ave., where close to 600 men are employed, and will, if it is deemed a success, be extended to the foundry and the northern works.

Under the present plan, several hundred bottles of milk, buttermilk and milcolate, purchased from the Kennedy Dairy Co., are distributed through the shops at 9 A. M. and at 3 P. M. by an employee of the company.

The men pay for their milk and according to G. E. Gernon, secretary of the company, the plan is proving a success. He is enthusiastic over the results already and believes that the milk distribution scheme will be made a permanent feature. Mr. Gernon says that each day the amount of milk purchased by the employees is increasing.

There is another angle to the plan which the Gisholt company is not overlooking; the firm expects that it will result in increased production.

⁂

WHOLESALE vs. RETAIL.

In last month's issue we published the opinions o several milk distributors relative to the comparative value of the wholesale and retail branches of their business. The following letter from a Pacific Coast deale reached us too late for that issue and we gladly give i space as follows:

"All of our business is wholesale, that is, to stores, restaurants and bakeries. We have not had any retail business fo the past five years.

"Inasmuch as our delivery conditions here are much different from any of the Eastern cities, and the number o dealers are about two hundred, to deliver retail a truck mus cover at least fifty miles for a small load, and much more i the load is as much as five hundred units. On the wholesal routes we put out from 1,200 to 1,800 units per truck, usin all two-ton trucks. There is less trouble with customers an collections, and our trucks last about three times as long o wholesale, as against retail routes.

"Most of the better plants here go after the wholesal business and leave the retail for the little one-to-ten co dealer. Personally, I will never have any retail unless something unusual turns up that may make us go after that trad to live.

"This plant specializes in just milk, cream, whipping cream and cultured buttermilk in bottles. We let the othe fellow sell a little of everything, and many do not kno where they stand on any part of their line."

⁂

NEW BUILDING FOR PENNSYLVANIA FIRM.

A new building will be erected by the Kane Dair Co-operative Assn., Kane, Pa., on a site recently purchased on Chase and Kinzua Aves. The dimensions o the structure will be 65 by 70 feet and it will be on story high, constructed of brick. The building will b designed by McCormick Co., Philadelphia architects, an will be equipped to meet all requirements of a moder milk plant, with the latest equipment that can be secured, containing receiving and pasteurizing room bottle room, storage room, mechanical refrigeratio room, bottle and washing room, by-products room, boile room, men's lockers, lavatories and shower bath. Th office and salesroom will be located in the front end o the building facing on Chase Street. The shippin platform will be constructed on the south side of th building, facing Kinzua Avenue. The operation of th whole plant will be visible from the street.

POSITION WANTED
(Rate: 2c per word)

POSITION WANTED—As manager of dairy. Years of experience in manufacturing and marketing dairy products including evaporated milk, condensed milk, ice cream, market milk and milk powder. Have college education. Now hold responsible position in Chicago but desire a change. Address: D-614, The Milk Dealer. 10-26

POSITION WANTED—Development and sales of milk industries machinery is drawing increasingly upon the knowledge of design, properties of materials and processing possibilities, i. e., chemical engineering. I am a chemical engineer with 16 years of experience in adapting equipment to efficient production and in selling specialized equipment—an equipment engineer. I am convinced that the selling of milk industries machinery to keep pace with increasing intelligent plant practice and large scale operation must become engineering selling. I see a future in this field as a representative of a progressive company. Do you want to talk to me? Address: D-579, The Milk Dealer. 10-26

POSITION WANTED—Married man, five years experience, desires position with live, progressive plant. Understands pasteurization, buttermaking and cultured buttermilk. Available at once. Address: D-572, The Milk Dealer. 10-26

POSITION WANTED—Accountant and office manager of mature business judgment and long experience in milk industry would like permanent connection with reliable concern. Excellent character. References. Address: D-574, The Milk Dealer. 10-26

MISCELLANEOUS.

NOTICE—I will invest $10,000 and services in your milk or ice cream business and guarantee increase of profits. Or will buy a business outright. Address: D-573, The Milk Dealer. 10-26

AN OPPORTUNITY—A wonderful opportunity for you to get into the milk business. Address: D-607, The Milk Dealer. 10-26

FOR SALE or EXCHANGE
(Rate: 5c per word)

BUSINESSES

FOR SALE — Milk plant completely equipped. Operating eight wagons in city of fifty thousand in central Michigan. Good supply of milk. Address: D-615, The Milk Dealer. 12-26

FOR SALE—Milk plant, good reasons for selling. Address: D-606, The Milk Dealer. 10-26

FOR SALE—Milk plant, first class plant and equipment located in city of 30,000. Handling 4,000 quarts daily. Located in good milk territory. Address: D-592, The Milk Dealer. 10-26

RATES

2c per word for ads placed under headings "Help Wanted" or "Position Wanted."

5c per word for ads placed under all other headings — "Wanted to Buy," "For Sale or Exchange," etc.

In computing amount of remittance, add six (6) extra words if wanted published under Blind Address.

Bold Type—Double regular rates.

Minimum Charge—50c.

Blind Address — EXTRA — 25c in U. S. only; 65c Foreign — To cover postage in sending out replies from this office.

REMITTANCE MUST ACCOMPANY ORDER.

IT PAYS TO ADVERTISE

NOTE: Names and addresses of advertisers using blind addresses cannot be furnished direct from this office. The advertiser can be reached only by using the key number and addressing your reply care of this paper.

NOTICE

The publisher disclaims any responsibility for the reliability of parties advertising in the Want Department, nor for the truthfulness of statements made in such advertisements. In answering such ads, ask for references if parties are unknown personally, before sending money. Our subscribers are requested to assist us in keeping unreliable parties from advertising by reporting suspicious dealings.

We reserve the right to refuse to accept advertisements which we believe are detrimental to the dairy industries.

Want Ads are accepted up to 7th of month preceding date of issue. Forms close on that date.

FOR SALE OR TRADE—Pasteurizing milk plant. One year business selling about 600 quarts. Address Clover Cream Dairy, Marshfield, Wis. 10-26

MACHINERY AND SUPPLIES

FOR SALE — Refrigeration Machines — Used—We have several used and new machines of nationally known make, which we can sell at a big saving to you. Will erect and guarantee the plants fully. Address: Erecting Engineers Company, 4725 West Lake St., Chicago, Ill. 10-26tf

FOR SALE—Victor Jr. churn, capacity 20 to 100 lbs. butter, good condition, too small for us. First check for $15 takes it F. O. B. Ashland. Cherry brine maker, complete with pump, in good condition. Take $10 F. O. B. Ashland. Ashland Sanitary Milk Co., Ashland, Ky. 10-26

DO YOU KNOW THE DAIRY FIELD?—We want to introduce the dairyman to a new, novel, still chocolate milk drink that will keep indefinitely without preservatives. A profit maker that he can easily prepare along with his other products. The right man can assure himself a substantial, permanent income. Write fully, stating your experience. Address: W. A. Heyman, 165 Broadway, Room 430, New York, N. Y. 10-26

FOR SALE—Ice making and refrigerating machinery. New and rebuilt. Our prices on new Waynesboro refrigerating equipment, delivered and installed very low. Buy direct from the manufacturer. All sizes. Get our prices on your requirements. Geiser Manufacturing Company, "Department B," Waynesboro, Pa. 1-27

FOR SALE—One 400-gal. per hour capacity, belt drive viscolizer. We can furnis motor to draw this machine if desire Price with motor, $900; price without motor, $650. Address: D-562, The Milk Dealer. 10-2

WANTED TO BUY
(Rate: 5c per word)

WANTED TO BUY—Milk busines What have you? Address: D-605, Th Milk Dealer. 10-2

4 Pointed Paragraphs on C-P Glass Lined Tanks

EXPLAINING WHY THEY ARE WORTH MORE

1. Header and Jets

Twelve or more removable brass spray jets, equally spaced at top of jackets, give perfect distribution of heating and cooling medium. Jets are designed to spray steam or cooling medium, thereby assuring maximum heat transference. Cooking on is practically prevented by this method.

2. Jackets

Inner and outer jackets are of heavy rust-resisting Armco iron with gas welded seams. Glass coating on inner jacket is of very highest quality, thoroughly fused to the metal and will not chip or crack. Commercial solvents and corrosives, or alkalis, do not affect it whatever.

3. Flush Valve

Standard equipment on all *CP* Tanks. It is conveniently controlled from top of tank by a lever (hand wheel on 50 gal. size). Valve proper is made entirely of bronze and can be removed for cleaning in a few seconds time. Outlet is threaded for I. A. M. D. Union Nut with reducing elbow for connecting to sanitary pipe line.

4. Safety Features

Jacket outlet is equipped with permanently open overflow which makes pop valves and pressure gauges unnecessary. This overflow forms a seal and prevents escape of steam vapor, yet allows condensation to pass off freely. With this feature it is impossible to get boiler pressure within the jackets.

The CP Tank costs more to make

therefore, it must sell for more. Yet, with all its expensive and noteworthy features, it costs but a trifle more than ordinary tanks. Remember---good equipment pays.

PRICES

Prices shown are for 100 gallon size as illustrated. Price of motor drive includes 2 or 3 phase 60 cycle A. C. motor. F. O. B. Factory.

$450.00	$497.50

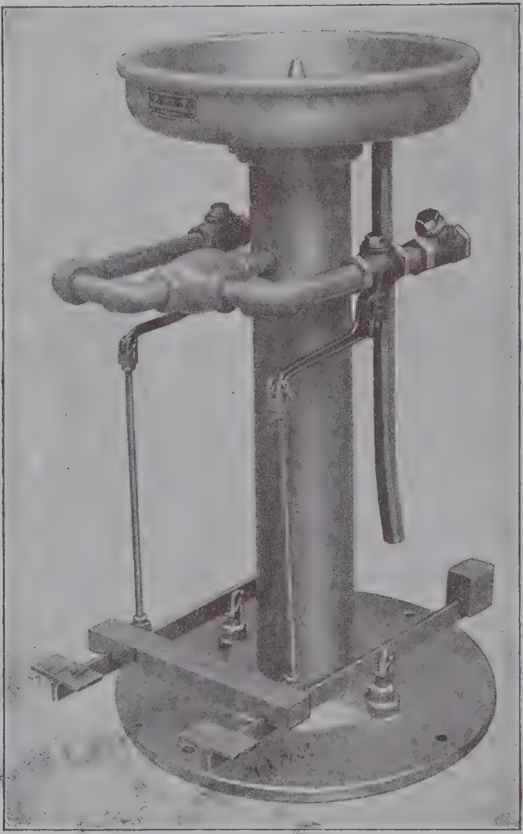
''FOR BETTER MILK HANDLING''

Clean Cans mean more Business for YOU . . .

The YORK Can Washer and Sterilizer will give you clean cans at a minimum cost



The YORK Can Washer and Sterilizer

Press the pedal on the right and you get cold water. Press the pedal on the left and you get steam. Press the cross bar in the center and you get hot water.

The can is inverted over the nozle which sprays in all directions. The hot water washes. The steam sterilizes and the cold water rinses.

Nothing could be simpler or more efficient than the YORK Can Washer and Sterilizer. It does the job quickly and thoroughly.

This piece of machinery is made by us "for better milk handling."

It is fitted with standard plumbing valves and guaranteed to stand up under constant use.

COMPANY

New Class "L", 300 gal. capacity pasteurizer, with pure Nickel lining, coil of seamless Nickel tubing, Nickel coil arms, and covering for coil shaft. Made by THE J. G. CHERRY COMPANY, CEDAR RAPIDS, IOWA.

THIS PURE NICKEL CHERRY PASTEURIZER

Safeguards the Purity and Lowers Cost of Dairy Products

AFTER two years of careful study—of exhaustive experiments—of tests of many different materials—The J. G. Cherry Co. finally came to the conclusion that only one material—Pure Nickel—would provide the properties that are essential for quality dairy equipment.

They found that Pure Nickel safeguards purity. It is rust-proof and highly corrosion-resistant. It is easily cleaned and kept clean—further assurance of wholesome operating conditions.

Pure Nickel equipment is economical. It is tough and strong as steel, will not chip or crack, and thus stands up under hard use. Its long life and wearability lessen the need for costly repairs, recoating and replacements.

Pure Nickel is now used for many standard types of dairy and ice cream equipment. Your manufacturer can give you full information or you may write direct to us.

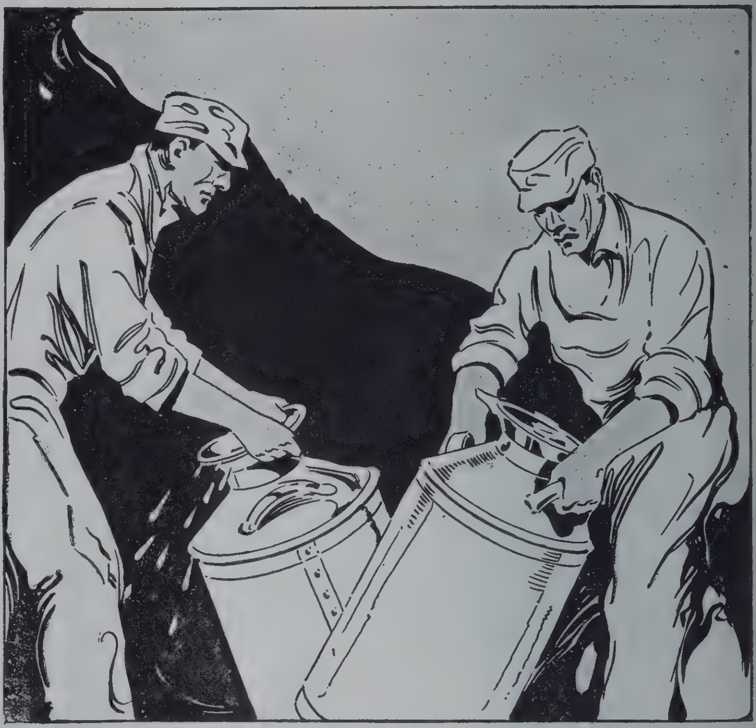
Seal Your Lost Profits
with Parchment Gaskets

Cream that slops when the can is "rolled" is lost—gone forever—and so is the money you would have received for it, if *Parchment Gaskets* had been used.



Nine reasons why you should use Parchment Gaskets

1. They prevent waste.
2. Reduce sediment.
3. Maintain a low bacterial count.
4. Save time in fitting lids.
5. Prolong the life of the cans.
6. Eliminate railroad claims.
7. Prevent cream from churning in lids.
8. Prevent contamination from "rusty lids."
9. Prevent sifting of dust between metal lid and neck of can.

Milk Can Gaskets are made from sturdy *Paterson Vegetable Parchment* from both 40 and 50 pound substance (50 pound recommended), size 11″ x 11″, fits any type can.

Speeds Up Bottle Washing

Cuts Overhead in Half—

THE MILLER HYDRO has made possible the only way known to twentieth century engineering genius of washing bottles chemically sterile in a quick mechanical operation.

In addition, it does away entirely with brush contamination, broken bottles and expensive delays. Only one man is needed to operate it where three to five men are required to operate other machines of similar capacity.

Consider for a moment the thousands of dollars the Miller Hydro can save annually right in your own plant. Before you finish paying for it, the Miller Hydro will pay for itself in overhead savings alone. No other bottle washing machine on the market can equal its performance in turning out clean, sterile milk bottles.

The Miller hydraulic way is safe and sure; its efficiency proven by over three thousand bottlers of carbonated beverages, breweries and dairies of enormous capacity.

Write us today for catalog and names of large dairies who have tested the Miller Hydro under every condition. Without obligation on your part . . . let us supply full and complete information.

Cooling Milk at Less Expense

Lipman Full-Automatic Refrigerating Machines, by virtue of their initial operating economy, as well as through their remarkable freedom from repairs, are unquestionably among the most economical commercial machines to operate. And a fraction of a cent less in cooling each quart of milk runs into real money fast.

Investigate! Find out why Lipman Machines last so long, run so smoothly, cost so little. Post yourself on the Special Lipman Features for they mean dollars to Lipman Owners. Ask the Lipman Sales and Service Station near you for details and a demonstration.

Write Today for our Illustrated Folder, "For Protection and Profit." See our exhibit at the Pacific Coast Dairy Show, November 13th to 20th.

(General American Milk Tank Car, interurban type, owned and operated by Gabel Creamery Company, Detroit.)

The illustration below shows the General American Milk Tank Car Equipment for interurban service. Two 2500 gallon, glass lined, seamless, one piece tanks mounted on General American patented cradles. Tanks are insulated and equipped with all accessories.

Now! Interurban Lines to Haul Your Milk

Read What This Progressive Dealer Does.

FROM their country plant, right through the heart of the city and over a switch into their own building. From Flint, Michigan to Detroit, a distance of 73 miles at a cost of 22 cents per 100 pounds. That's how Gabel Creamery Company in Detroit use interurban cars with General American Milk Tank equipment. Rapid, economical, safe transportation. Less handling, no spillage, or spoilage. An efficiency builder and money-maker for Gabel's.

This new General American development opens up new opportunities for dairymen whose plants adjoin interurban lines. No change of milk temperature, no duplication of labor, no loading and unloading overhead...just direct-to-destination, rapid transportation, proved and profitable.

This was made possible through the foresight of the Detroit United Railway and their co-operation with General American engineers.

Write us if you are interested. A letter to our nearest office will bring the detailed facts to you.

Glass Lined Refrigerator Milk Tank Cars

? - ? - ? - ? - ?

Here is a photo of several milk bottles as they came back to the dairy. Thousands of bottles like these, containing sour milk, butterfats, dirts, etc., which will not drain out by gravity, are returned to every dairy daily. A record made for one day's run in a plant where approximately 15,000 bottles are washed per day showed that over 256 pounds of this dirt, refuse, etc., still remained in the bottles when they were fed into the washing machine. Tests also showed that these substances could not be flushed from the bottles by merely giving them a light rinsing with hydrant water.

Do you think that these contaminating and objectionable deposits should be carried into the soaking tanks of the bottle washer and allowed to accumulate for weeks?

Under such conditions can an alkali solution continue to be a clean and sanitary washing medium?

Can such a solution maintain a uniform degree of alkali strength without continually adding large quantities of alkali to it?

Can a bottle containing a quantity of this dirt, butterfat, etc., receive the same chemical treatment from the alkali solution as one that enters the solution free from these deposits?

We dare say that the unanimous answer to these questions is NO. Then why use bottle washers which operate under these very conditions?

The CLEVELAND BOTTLE WASHERS are the only machines that remove all deposits from the bottles before they enter the soaking compartments.

The CLEVELAND METHOD of treating bottles not only means sanitary and efficient washing and sterilizing but also means a great savings in alkali, which amounts to hundreds of dollars per year.

The CLEVELAND BOTTLE WASHER insures you of the most modern, efficient, and economical method of washing and sterilizing bottles.

Built in all sizes and to meet every condition. Write for full particulars.

THE UNION ENGINEERING CO.

Cuyahoga and W. 4th Street CLEVELAND, OHIO

"Something ought to be done about it"

If you read the "Letters from the People" column of the daily papers, you will see how frequently the milk-man is numbered among those who cause annoyance by awakening people in the early morning hours. "Something ought to be done about it" say the writers of these letters.

The one to "do something about it" is the milkman himself — for surely the good-will of his customers means more to him than to anyone else.

The consideration your men may show in walking softly through apartment halls, and setting bottles down quietly, cannot make up for the clattering noise of the horse and wagon which heralds their approach. The call of a milkman becomes a thing to be dreaded.

Dairy companies who have substituted the quiet Ward Electric for the noisy horse-and-wagon say that their customers are exceedingly grateful for the improvement. Put yourself in the customer's place. Other things being anywhere near equal, wouldn't you take your milk from the company which delivers it without awakening you from a sound sleep? The importance of this feature of your service—*quiet delivery*—cannot be overemphasized.

This superior form of delivery is faster than the "horse that knows the route"—proven by actual stop-watch tests in leading dairies. And companies which keep accurate cost records report that the substitution of Ward Electrics for horses has lowered their delivery costs considerably.

You will be interested in reading about our new retail milk truck and the ingenious method we have devised for delivering a load of 35 trays so that each tray is handled only once.

Write for our retail milk delivery folder.

Pop Gets Hot About a Hot Motor

TRADITION
PROGRESS

"Lad—

I'm running to the ground every one of these shutdowns we've had on the bottle cleaners. They're nearly all due to your lack of regular motor inspection. Here's a case where this fan was all loose and bent. Of course the motor heated up because you didn't catch the trouble. Then you blame it on the motor."

"Yes, Pop—

did you expect when yc bought those motors from your non-develo ment gang that you'd have to spend the pri of the motors each year for private detecti service to watch over the crimes that the mak put into them? That could never — ye NEVER—happen to a Linc-Weld motor b cause they make their fans by punchings fro He-Steel welded (Stable-Arc of course) smac up against the rotor end plate."

See how they do it — Page 9 of the Motor Book. If you haven't a copy write to

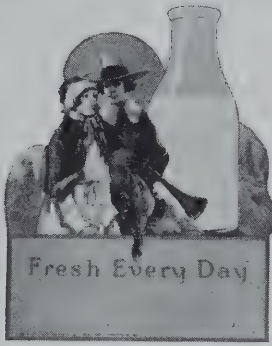
YOUR DAIRY COMPA
DAIRY COMPANY
MILK

Giving YOUR BUSINESS a Personality —



Fresh Every Day

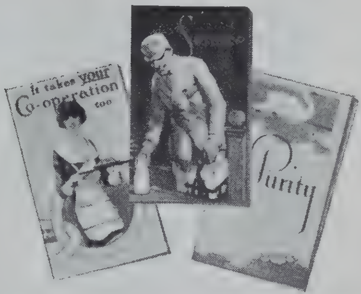
ON the loading platform of your plant it is "*your milk*"—is it still "*your* milk" when it reaches the homes of your customers or is it just "milk"?

The answer to that question depends entirely on whether you preserve your identity clear through to the homes you serve. And it's a mighty important question because millions of gallons of milk flood the cities of this country every day. And if you're spending money to get good milk and to give good service, you can't afford to submerge the personality of your business in the daily Niagara of milk that pours out over the country.

That's what advertising is for.

Never mind now about education. The purpose of advertising isn't to educate—it's to sell goods. And you can use it, if you like, to make *your* milk stand head and shoulders above the common level.

Let us tell you how we are helping other dealers do this job. We've had a lot of experience in the milk business. We know the milk man's message and the milk man's market. Maybe we can help you. Drop us a card.



It takes your Co-operation too

A Wonderful Achievement in Milk Plant Engineerin

It's the Air Brush

If you don't know about it, ask us.

HERE was a problem that required real engineering skill. The soaking and washing of the bottles is done in the basement—two floors below the bottling room.

Clean bottles at the rate of 480 per minute are delivered and distributed to the fillers in this room.

Three Large YUNDT
MILWAUKEE AIR BRUSH
MILK BOTTLE WASHERS

automatically feed these nine type L Milwaukee Fillers. All operations are synchronized to harmonious operation of the various units. Everything is controlled automatically.

What Yundt engineers and Yundt Milwaukee Air Brush Milk Bottle Washers have done for the Pevely Dairy Co. in this plant at St. Louis, Missouri, they can do for you. The size of your problem is no obstacle. A small problem receives equal consideration.

Fifty Years of Honest Equipment

O & B
Purity
Line
Cattaraugus
N.Y. U.S.A.

THROUGH more than fifty years of honest manufacture, O & B Purity Milk Handling Machinery and Supplies emerge secure in public favor. Their value and lasting satisfaction are due in large part to high quality materials and thoroughly skilled and contented workmen.

Here in beautiful Cattaraugus among the enchanting foothills of the Alleghenies, our community of O & B workers thrive and prosper, generation after generation.

Good goods at reasonable prices are the natural results. Why not enjoy these advantages? You do so when you purchase O & B Equipment.

Write for descriptive folders.

O & B Purity Pasteurizer, Mixer and Starter Can, specially designed, propeller type agitator and a current deflector producing perfect results at low cost. Fitted with noiseless steam jet water heaters for pasteurizing and with new double agitator for ice cream mixture. Inner can of heavy, tinned copper.

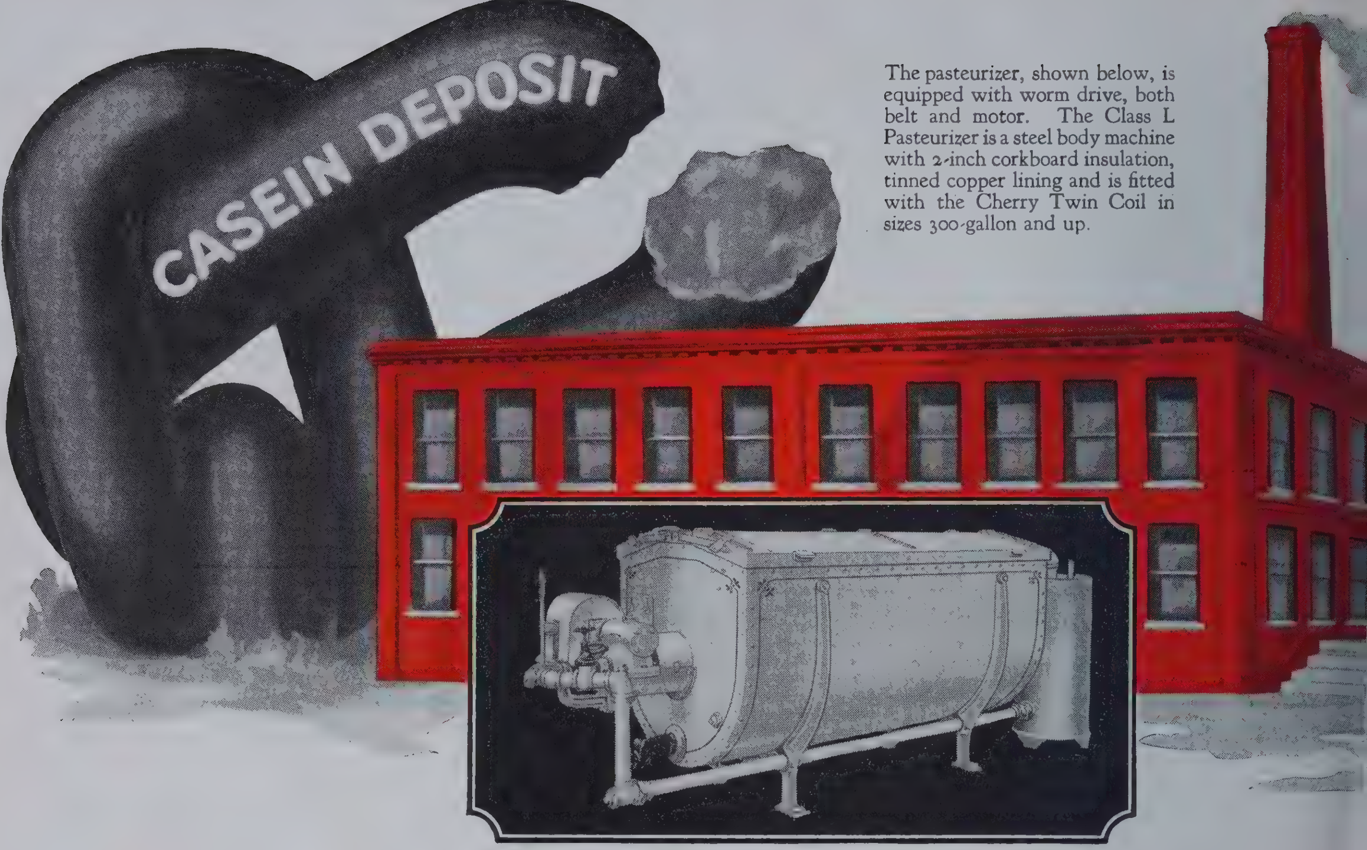
Casein Deposit hinders sales and hampers profits–reduces cream line and lengthens cleaning time–and it is needless!

Free Your Plant

TOO LENGTHY
CLEANING TIME
SEIN DEPOSIT
POOR
CREAM LIN



The pasteurizer, shown below, is equipped with worm drive, both belt and motor. The Class L Pasteurizer is a steel body machine with 2-inch corkboard insulation, tinned copper lining and is fitted with the Cherry Twin Coil in sizes 300-gallon and up.

The Class L Cherry Coil Machine — Motor Drive.

With Cherry Coil Pasteurizers From Casein Deposit's

CASEIN deposit, milk stone, cream plug — they're all names for the same thing and they all foot up to the same result — *needlessly* lengthened cleaning time and heating time, added labor cost and lessened profit, a poor cream line and diminished sales, plus the ever present danger of a poor cleanliness rating by the Health Department.

Are your sales and profits hampered and hindered by these casein deposit shackles? Is your pasteurizing equipment difficult to clean and slow to heat up? Are you paying out needless payroll dollars and cutting slices off your profits? Do your competitors' bottles show a deeper cream line and win customers away from you? Then learn now how you may free your business from these costly, unnecessary chains.

The work and worry, the cost and loss, due to casein deposit—steel wool, steel brushes and backbreaking, time consuming hours of hand cleaning—are absolutely needless where Cherry Coil Pasteurizers are employed. For when you say that a Cherry Coil machine is easy to clean you only say half of it—the other half is that it takes deliberately improper operation in order to cause casein deposit in a Cherry Coil Machine.

The very principle of Cherry Coil Pasteurization is **opposed** *to the formation of Casein Deposit.*

r Plant May Be Freed Forever
t-hampering Shackles

n a Cherry pasteurizer the heat is rapidly and evenly diffused by the Coil
hroughout the entire contents of the vat. Excessive temperature is unneces-
ary and detrimental. Too lengthy a heating period is equally unnecessary.
'o heat the contents at the center of the vat to the proper degree it is needless
raise the temperature at the sides or wall of the vat to the high degree
hich causes casein deposit.

nd because the proper temperature is evenly and rapidly diffused through-
ut the entire contents of the vat, heating time need never be prolonged to
e detriment of the cream line. The Cherry Coil principle, you see, fights
ff casein deposit and makes cleanliness easy — protects the cream line and
leases your customers.

herry Coil Pasteurizers are made in practically every size and capacity. With pure nickel coils and linings or with coils and linings of heavily tinned copper. Motor driven or belt driven. Wood bodies or steel bodies. A machine to fit each and every need. Find out more about them. Get our free, descriptive, illustrated bulletins which give you the whole story on the entire line. Clip the coupon or send a postcard.

Dairy Products Association of Kentucky—Final meeting of the spring and summer season will be held in Cincinnati, O., on Wednesday, April 21, at the Gibson Hotel. Carlton Ball, 206 Republic Bldg., Louisville, is general secretary.
Oakland.

A MILK dealer in a city of about 15,000 inhabitants, tells us that as the result of a price war in his town he is now making a little money where formerly he had hard work to keep up with expenses. Along last Spring he was getting 12 cents per quart for his milk. Peddlers were under selling him, one and even two cents per quart. He tells us that he decided to make life interesting for them and with one blow put the price down to eight cents per quart. At the same time he staged an advertising campaign, emphasizing the superiority of pasteurized milk and now he has most of the milk trade in his community.

"That's what volume does," was his parting comment and we pass it on to our readers for just what it is worth.

⁂

WE HAVE always taken pride in the high caliber of the dairy industry's representation in the advertising columns of The Milk Dealer. More than once we have pointed out to our readers that the list of our advertisers is well nigh a complete roster of the reliable
and progressive members of the milk trade supply i
dustry. We were particularly reminded of this in sca
ning the list of exhibitors at Detroit who were appealin
to the milk bottling industry. We are mighty proud
the firms that are represented in our columns.

⁂

A SOUTHERN Indiana milk dealer says that he ha
solved the problem of how to get his customers
visit his plant. For a long time he has invited folks
his town to come and look over his bottling plant,
which he is very proud. Several weeks ago he issued
premium catalog, offering a variety of useful items fr
in return for caps taken from his milk bottles. He us
a specially printed cap and these caps cost him abou
one cent per quart of milk when exchanged for prem
ums. He puts the caps only on quart bottles.

He offers an aluminum pan, for instance, for 26 mil
caps. If the customer wants the pan delivered by th
driver she must so notify him and turn over 26 mil
bottle caps. She is urged, however, to deliver the ca
to the plant and carry her premium home with her. I
such case she is credited with five bottle caps. Or i
other words, she gets the aluminum pan for 21 caps.

As a result very few of his customers have asked th
drivers to deliver the premiums. Practically all of the
visit the plant, where they are welcomed and escorte
through. A nice increase in business has followed an
of course, the milk dealer is happy.

⁂

THE city consumer awakes to find a bottle of milk
his door step. A telephone call will bring his su
ply of other food items from the grocery store. If th
purchaser looks upon milk as he does other items
food—something to eat and that's all—possibly he ca
not be blamed. Possibly it is the fault of the man wh
sold him the bottle of milk.

Under normal trade conditions many articles of fo
reach the consumer in the same condition that they le
their source of production. It requires little care an
little expense to keep them in the same condition.
they are of fine quality, their condition is apparent
everybody, and they command a price accordingly. T
consumer can eat them with the assurance that his heal
is protected. Take a sack of flour, for instance.
one needs to take a loss in handling flour, except p
haps through market fluctuations, and no expensive m
chinery is required to maintain its purity and who
someness. The consumer need give little concern to
source of production or the method by which it has be
handled.

A bottle of milk on the consumer's door step is
entirely different product. It may or may not be in
wholesome condition as when it left its source of prod
tion—the dairy cow. If the owner of the cow takes c
of the milk so as to preserve its purity, and tests
cows regularly to keep them in a healthy condition,
is entitled to extra pay and the consumer should be g
to give it to him. If the dealer has invested money

gh priced equipment for the purpose of preserving the urity of the milk, he is entitled to extra pay and the nsumer should be glad to give it to him.

Some consumers gladly pay for pure, wholesome ilk. They realize the difference between a bottle of ilk and a sack of flour. Others are paying reluctantly. hey don't seem to realize the difference between the vo products. The size of the package is about the only easuring stick they apply, if they attempt to judge lative merits. They don't know what expense and efrt the milk dealer has put into that milk bottle from e time the milk left the farm until it reaches the door ep to make its contents pure and wholesome.

Many consumers are becoming better informed lative to food values and many of them are buying ilk more cheerfully and more of it than in the years one by. They are recognizing the superior value of ilk as a food, but if they are going to consider only the od value of the milk then a bottle of clean milk is orth no more than a bottle of unclean milk, for all the oney and effort that a milk dealer puts into a bottle of ilk doesn't add to its food value; the cow puts that ere.

It is all very well to emphasize the splendid work at the cow has done, but it is a mistake to overlook hat the milk dealer has done in co-operating with the w in furnishing the city consumer with a product that not only high in food value, but also pure and wholeme.

We have said before in these columns that milk deals are often too modest. They apparently don't like to lk about what they are doing. Some of them perhaps not fully realize the important part they are playing this great food game.

* * *

T'S SUCH an easy job for the most of us to run the other fellow's business, you know. His job looks so sy sometimes that one wonders what kind of wood or one his head is made of anyway.

Take your job for instance. We wonder sometimes we visit milk bottling plants and talk with proprietors, perintendents and sales managers, why they grow rinkles and gray hairs. Taking nice pure milk, runng it through up-to-date machinery of various kinds d setting it on the door step of the consumer, who ust have it, looks like a simple job. In spite of its aprent simplicity milk men seem to have troubles all eir own. It is just possible, too, that if you were to ckle our job you would experience an awakening.

If we were to change jobs about the time we got our t ideas into full running order the business possibly ould be all messed up. You might do better on this b than where you are and we might do better where u are, and then again we might not.

We do know, however, that both of us would meet with some surprises. There are some kinks in this siness that you probably never dreamed about and we e sure we would find some in your particular job that uld keep us humping. Probably we hadn't better trade jobs after all and if we can help each other a little as we go along we can serve better right where we are. There is a lot of satisfaction in trying to serve, however, and if a goodly percentage of the folks we are trying to serve appreciate our efforts we ought to be happy.

This is a great business for service, this milk business. To supply pure milk for the family table is more than a job. It is a privilege and it carries with it a responsibility. A man who keeps trying all the time to raise his standard of quality and service should be happy if he is making progress. He is the last fellow on earth who should get out of sorts with his job. No matter how small a place you fill in your organization, you have a right to feel "chesty" if your organization is supplying human beings with pure milk and pure milk products.

While you are doing it we are going to try to keep happy in the knowledge that some folks, yes, a lot of them, seem to gain inspiration by the contact they enjoy with others in the same line of business through the columns of The Milk Dealer. If we bring all of you folks closer and closer together as the years go by that is a job big enough for us.

* * *

"THE Milk Dealer is getting better every month," remarked a kind friend one day recently as he went on his way. We are inclined to believe that our friend is right; in fact, we don't want to believe anything else. We want to believe we are traveling in the right direction. The business of publishing a trade paper like The Milk Dealer is just like any other business. Such a business can't stand still; it must either go forward or backward. We do know it is costing us a whole lot more money to publish each issue of The Milk Dealer than it did one year ago, two years ago, or at any other time in the past. It is not only costing us more money but it is costing us more effort all along the line.

In telling us that the paper is getting better each month our friend added another to many compliments that we have received. We greatly appreciate these splendid friends and we pledge them that we shall keep right on going in the right direction. The milk bottling industry is, we believe, still in its early stages of development. As it grows in the years to come we aim to establish a record for accomplishments for The Milk Dealer that will compare favorably with that of the industry.

* * *

THE magnitude of the milk dealers' job is better understood when we search out comparative figures. In weight there is more milk consumed in a large city than flour, bread being nearest to milk in volume of weight, after which follows sugar, of which every inhabitant consumes nearly a hundred pounds a year. Other important food products are potatoes, onions, spinach and grape fruit. The weight of the milk consumed is greater than any of these.

Milk in Factories

Increased Consumption of Milk in Factories Reflects also on Home Consumption

MATERIAL in the form of posters, leaflets and a booklet describing the advantages and methods of serving milk to employees, is the newest product of the National Dairy Council. Although there is some discussion among milk dealers as to the value of this factory business, the council has found in a survey of the country that many large companies have been using a regular mid-morning and mid-afternoon milk service for as long as fifteen years.

There is undoubtedly a big field open in this direction, the survey points out, and checking up on the reports of those who are serving milk we find that in addition to the six main reasons listed here for serving it to employees, there has followed an increased home consumption in most cases, which followed the factory service.

Here are some benefits as disclosed from experience:

It reduces the number of accidents, because the mind is more alert, the body less tired, and nerves are steadier.

It greatly reduces the percentage of time lost on account of sickness.

The employees perform their work with greater ease, accuracy, and efficiency.

It reduces doctor bills because of improved health.

It helps build up those who have low vitality from any cause, and who should take added nourishment in order to continue to do their work more efficiently.

It helps to build morale in the men because they perform their labor with less fatigue of body and mind, and after the day's labor is over they are better able to enjoy their home life and recreation.

What Is Your Experience?

Many dealers are finding that in addition to the increase in business from serving milk in factories, where of sufficient size, they are also getting an increased consumption in the homes of these same factory employees. Others believe that the extra service, the trouble of convincing employers that milk drinking is a good thing for their men, and the bottle wastage is too big a handicap. Through the columns of The Milk Dealer, we invite YOUR opinions and experience in factory serving.

Three large posters, one of which is reproduced on the cover of this issue of The Milk Dealer, can be secured from the dairy council or its branches, to encourage the drinking of milk in factories. A booklet has been prepared which tells about the serving of milk, especially to interest factory executives. It is called "Industrial Milk Service." Other leaflets can be secured to place in the hands of the employees, and booklets which give ways of using dairy products efficiently and economically in the home are available from the council.

Less Absence in Factories Where Milk is Served.

Typical of the letters received from concerns where milk has been served for a number of years is this one from a factory production manager at Syracuse, N. Y.:

"During the summer of 1921," writes William Dunk, production manager of the H. H. Franklin Manufacturing Company, "the factory began an experiment to distribute milk to employees during the working hours. We picked what we considered the best source of supply and contracted for a minimum number of pint bottles of milk to be delivered twice daily, unsold bottles to be returned. Chemical tests of milk from various producers were made at the very start to make sure that the milk to be sold in the Franklin plant was the purest that could be bought. Arrangements were made for refrigerating the milk so that it could be delivered to the employees ice cold.

"Various stations were provided, and from these stations men with small trucks delivered the milk throughout the plant to all employees who wanted it. Incidentally, most of them did want it. The summer of 1921 was a hot one; at times the heat was almost unbearable. We had a heavy production of cars to get out and there was no question in my mind but that the serving of ice-cold milk to employees during working hours helped to maintain their bodily vigor and render them less liable to fatigue. The milk was on sale also during the noon hours.

"I have noticed that there was actually less absence in the departments where milk sales ran unusually high than in other departments, and the productiveness of these departments seemed to be greater. During the summer of 1921 we had an average of 2,000 employees. Milk sales averaged 2,000 pints daily. On one day over 2,500 pints were sold."

Included in the booklet on industrial milk service are letters of a similar nature from such firms as the Boomington, Illinois, office of the Chicago & Alton Railroad, the Seaman Body Corporation, Milwaukee, Wis., the Caswell-Runyan Co., Huntington, Ind., the Huntington, Ind., Shoe and Leather Company.

Time Off for Employees to Get Milk.

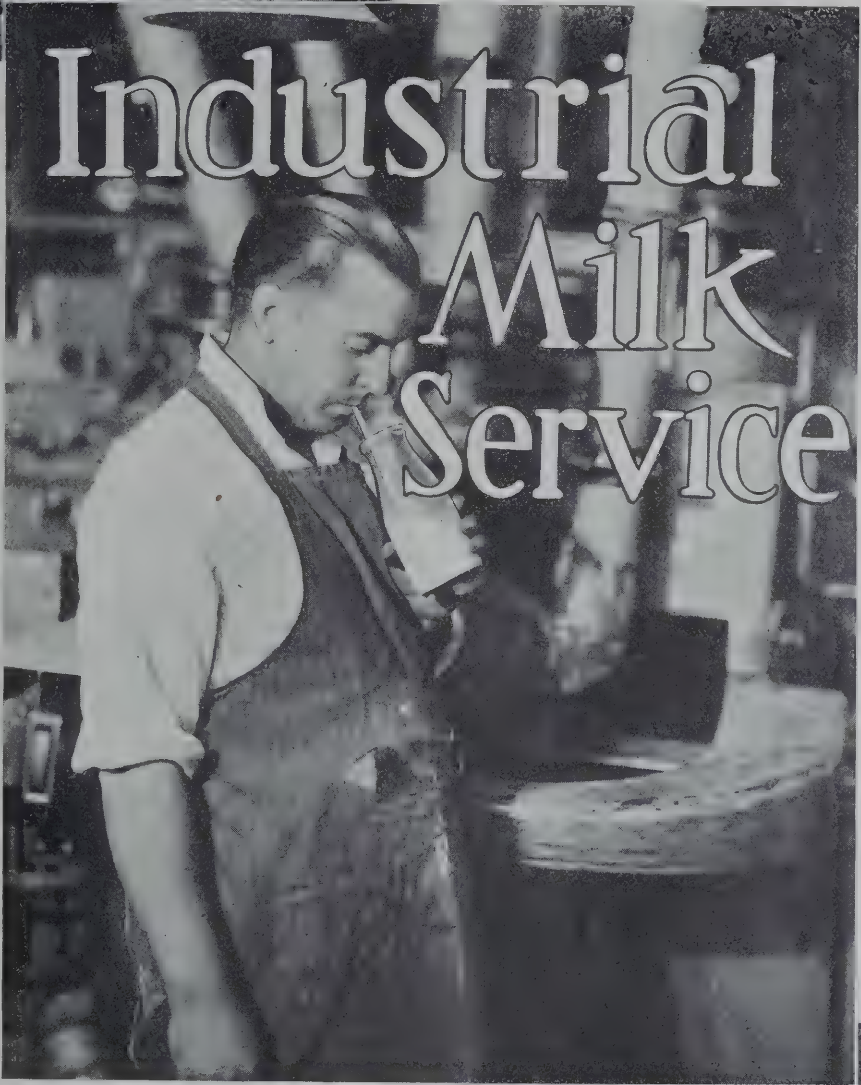
Insurance companies at Hartford, Connecticut, report that they find it profitable to supply milk free of charge to their employees who are undernourished or have a tendency toward ailments. They allow time off for these employees to go to the cafeterias during the forenoon, and find that their sickness and accident records show up much more favorably as a result.

Plans for distribution of the milk, which in the case of some organizations averages over 2,000 pints daily, are summarized by the dairy council as follows:

Factory Distribution Plan.

The factory buys the milk direct from the milk dealer and has the milk distributed to the employees through the factory by means of a milk cart or wagon on a definite schedule, each man being served at his post of duty. In such a case, collection is made for the milk as it is passed out, or a coupon is taken from a coupon book which the employee has previously purchased. Sometimes a ticket purchased by the

Industrial Milk Service



employee to be punched is used. In case the plant has a cafeteria, milk service is handled directly through such cafeteria.

Milk Dealer Distribution Plan.

The factory organization authorizes some milk dealer to go into the factory at stated periods, calling upon each worker and supplying those desiring milk with a bottle and straws accompanying it. In such cases the milk dealer collects direct from each person taking milk or keeps a record of those taking milk and gives this record to the manager, who in turn deducts the cost of the milk from the employee's pay check and turns it over to the milk dealer deivering in the factory. Distribution by the milk dealer and collecting directly from the employee seems to be the plan most generally used. In some cases, instead of the milk dealer making the distribution, some person establishes the service with the consent of the factory management and makes collection directly from the men. This system has been very successful in the factories in Huntington, Indiana.

Milk Station Plan.

Milk stations are established throughout the factory, and workers are permitted to go to the stations for milk either once or twice a day, buying the milk directly from the person in charge of the milk station. As a general custom, straws are furnished with the bottle so as to eliminate the necessity of using glasses or paper cups.

Industrial milk service will be a principal project throughout the organized dairy council territory with the securing of this new material to augment work which has already been done in factories and schools. Through the service bureau of the National Dairy Council in Chicago this same material is made available at cost to all dairymen, and the dairy council now has sufficient supplies to accommodate any number of requests from milk dealers or producers.

As an example of the "pulling power" of the work being done by the National Dairy Council in its promotion work to increase the sale of milk in factories, the work that it did among the Wisconsin Manufacturers' Association serves as an excellent illustration. Some time ago the council secured permission from this association to send a letter to all of its members to promote the practice of drinking milk at the factory. Although but one letter was sent out, the response was far beyond expectations; and as a direct result, many factories that it had been impossible for milk dealers to enter before were thrown open to them.

In most cases, the manufacturers allowed the council to enclose literature pertaining to milk in the payroll envelopes of the employee — a thing that would be next to impossible to perform if attempted by individual or groups of dealers.

Reviewing the Past and Planning for the Future

Address by President F. H. Kullman at Nineteenth Annual Convention of the International Association of Milk Dealers, Detroit, Michigan

ON ACCOUNT of the continued illness of our president, Samuel O. Dungan, it has become my duty to preside over this, our nineteenth annual convention.

I know that we have all looked forward to the time that our dear friend Sam would preside over this convention. I am sure that you all feel as I do—that to miss his greeting and the opportunity to be with him as president of our association is a real loss to all of us.

Throughout all the years of the existence of the organization, no man has been more proud, worked harder, or more willing than Sam Dungan. We have all been cheered by his hearty greeting and inspired by his example.

The royal way that he and Mrs. Dungan entertained us at Indianapolis last year can never be forgotten.

I ask your indulgence and consideration in my effort to humbly carry on the duties that he could so well perform.

Adopted at the Detroit Convention

WHEREAS, It is generally conceded that pasteurization consists of heating milk to a temperature not lower than 142 degrees F. and holding same at this temperature for 30 minutes,

THEREFORE, BE IT RESOLVED, That the International Association of Milk Dealers, in convention assembled, recommend that the Committee on Standardization of Equipment of International Association of Milk Dealers, investigate this matter, using such assistance as it may deem necessary to determine what types of equipment will provide that all the milk in any part of the equipment is held at a temperature of not less than 142 degrees F. for not less than 30 minutes.

As you know, President Dungan was taken ill immediately following the convention of last year. From time to time we heard that he was making progress. He was only able to attend one executive meeting during the year, but we all felt that there was no doubt that he would be able to enjoy presiding over this the nineteenth annual convention. However, he has advised us that it would be impossible for him to undertake the duties, and I am sure that our united prayer will be for his early recovery and return to our future meetings.

Owing to Mr. Dungan's illness, the duties of his office, according to the constitution and by-laws, has fallen upon me as vice-president and I have endeavored to discharge them to the best of my ability. This report, however, will not be complete without paying my respects to the other members of the executive committee, Dr. Walmsley, and the entire board of directors for their splendid help and co-operation, without which my task would have been a difficult one. I shall endeavor to make a very brief review of the association's activities for the year as they have passed through the executive committee's observation.

The Eighteenth Annual Convention Group Section Meetings.

The eighteenth annual convention, not having become a reality at the time of the last presidential report, I think deserves passing comment. Those of us who attended the last annual conclave of our industry are, I am sure, of one mind that it marked a very great stride—in the value of association service to the dealer.

The group plan of meeting, which was first attempted at Milwaukee, was amplified at the eighteenth meeting and to the same extent that it was larger in form, it was greater in interest and value to our members.

Practically nothing but favorable comment was received during and after the convention from every part of the country. The members were high in their praise of the program and the way the officers of the several sections arranged and conducted their programs. The only complaint, if such it can be called, was to the effect that more of the members could not have sat in more of the meetings.

Our section officers have endeavored to overcome this to some extent but in the few days set aside for the annual convention, it would be absolutely impossible, as you well know, to so arrange a program that every department of our business can receive attention and still make it possible for every member of the convention to attend every meeting. To do so would involve sessions of 15 to 20 days. A very decided effort, however, you will note, has been made to make the service available to a great number this year. Your association was practically unanimous in its demand for the perpetuation of this form of annual meeting.

District Conferences.

I think you are all familiar with the very distinct and valuable service that is being rendered by our association through its Accounting Bureau and Controllers' Council, particularly through the sessions known as the district meetings in the different parts of the country during the year.

The board of directors has received suggestions from the membership to similarly organize the sales and advertising section, arranging to bring the sales and advertising managers together, possibly at the same time we are holding the district meetings of the controllers' council. It was thought that in this way the very best sales and advertising ideas from all over the country could be reviewed during the year, and from these sectional studies an annual program arranged that would bring together the very best experiences o the year past.

I would like to have this suggestion given some thought by the sales and advertising group this yea and possibly a recommendation of some kind brough in upon it. We want, of course, to creep before we walk and not plunge into these things too rapidly for they certainly are worthy of study, and the consideration of these suggestions by the groups themselves is the bes place to bring the matter before the attention of th board. If such a plan should work out successfully, w may look forward to the creation of such activitie

The Percentage and Cash System

Building Business by Making Employees More Efficient and Developing Their Initiative. How We "Sold" Our Employees on Our Product So That They Could Sell Others

By W. H. RICHARDS*

THE most discussed problems today of the milk business are "How to Increase Your Sales" and "How to Reduce Losses in Collections."

The first problem, which is sales, has been best taken are of by us through the inauguration of a straight perentage plan of paying salesmen, rather than a straight alary or a salary and percentage.

The second problem, or collections, has been elimnated through the inauguration of the cash system hich discontinues the handling of all customer accounts n the office, and makes the salesman on each route reponsible for all products sold by him.

Percentage.

For several years we operated on a straight salary asis, with the result that our business was at a standtill. This condition was partly overcome by allowing he men a percentage on all sales over and above a cerain quota. This plan was not entirely satisfactory, as bout half of the men would work for the extra percentge and the others were satisfied with the regular uarantee.

We finally arrived at the conclusion that there was nly one way to get results, and that was to pay the nen entirely on a percentage basis in order to get all f them to increase their sales. It had the immediate ffect of weeding out the poor salesmen as soon as they egan to see that it meant an extra hour or more every ay soliciting for new business in order to show an ncrease.

The weeding out of poor salesmen meant a large urnover of men, which was expensive, and which we ere unable to account for until we organized a class in alesmanship. It was then we began to realize that a umber of our men knew little or nothing about our roducts or how to present them for sale.

We immediately began the study of our products from he source of supply at the farm to the housewife's door, nd it was surprising how little any one of the men knew bout grading, pasteurizing and preparing for market ur regular pasteurized milk. They knew less about our ertified milk, and the conditions under which it must e produced and handled in order to pass the state reuirements.

These problems were discussed by everyone and we ook each man through the plant, one at a time, and explained every stage of the process so that everyone had good working knowledge of the products to be sold. ext we picked out two of our "go-getter" salesmen to repare the sales talk to be used in presenting our goods, hich covered most every point that a prospect might ring up.

Now that the boys knew the products and the reasons hy the housewife should buy them, there was one more oint to consider and that was the courage to approach prospect and tell her what they knew. For this lack f courage to get up on their feet and talk, we secured he services of a public speaking instructor at a small ost (paid by each salesman) and each man had to stand p in front of the class and tell his own little story. We had each one act as critic at different meetings, and it was his duty to criticize the speaker whenever he made a mis-statement. This was the best thing we ever did to give the boys confidence in themselves, and it has made real salesmen out of them.

We employ only men who have had experience in meeting the public, with a fair education, and who have not worked for a competitor. This gives us good material to build from, and has made some A-1 salesmen for us. In fact, several of our boys have stepped up from milk salesmen to city and traveling salesmen for national selling organizations.

Cash System.

Our cash system is not a cash system in the sense that our salesmen collect for every article sold each day, but it is a cash system in that we carry no customer accounts at the office. The only accounts we have are with the salesmen who turn in their cash each day for the difference between what they take out in the morning and what they return in the afternoon.

Our men are furnished with a certain amount of milk and cream coupons (with the value printed on each coupon) and these are charged to their account the same as so much money. They may sell these coupons to the trade for cash, and in that way collect in advance for the products, or they may sell for cash each day. In some instances the men carry accounts with a few customers that are prompt pay, providing they pay on the fifteenth and last day of each month, which are the dates the salesmen must settle up with us for any amount they might owe us through a shortage in their accounts.

Our percentage system of paying salesmen is based on the money turned in rather than on the products sold, which means that they must turn in their money promptly in order to get their percentage.

This means that we get the cash for every dollar's worth of merchandise that leaves our plant and losses on collections have long since disappeared.

The saving in bookkeeping, paying special collectors and losses through bad accounts can be used partly to increase the percentage to the salesman on his sales, as a real incentive to build up his business. This has been done by us to the mutual advantage of both salesmen and employer so that we have a collection of real "go-getter" salesmen as you may see by the following articles:

By M. W. Moore, Salesman.

During the time we have used the cash system there has been much less trouble and discontentment among the salesmen and customers than during the time we operated the credit system. It saves the driver considerable time in not having to mark down the amount each customer takes, and also relieves the customer's mind of being overcharged. It gives the salesman more time to go after business that increases their pay through the percentage system.

The percentage system of paying salesmen is the most satisfactory way of paying because each man has a personal interest in the business the same as if it were his

Making the Game of Dairy Health Interesting to the "Poor Little Rich Kiddies" in School

DeCoursey Cream Co. of Wichita Proves, by Interesting Game of Health, How Children of all Classes may be made Interested in Drinking More Milk

THE "poor little rich boy" has been the object of the pity of moralists and philosophists for many years, and the milk dealers, who have a more practical interest in child welfare than anybody else, have gone further and seen the distress of the poor little rich girls as well.

There are two most important phases of milk merchandising today. One is the matter of getting the interest of children of all classes. The other, and bigger one, is getting the interest of the wealthy people.

We human beings seldom think of wealth and trouble in the same breath, and yet most of us realize that money, instead of being an absolute guarantee of happiness, is anything but conducive to the proper mental frame such as only can come from a satisfied mind.

The DeCoursey Cream Co. recently launched a movement that promises to show the way for milk companies all over the nation to increase sales. This company devised and put underway a system of health games for school children that have proved to be most successful in getting the interest of the kiddies.

Most of us who can go back as far as the beginning of the war—rather the beginning of America's participation—will recall the alarm that was created when it was announced that approximately one-third of our young men of the land were physically deficient. Perhaps that was the beginning point of a great health urge that, in the last few years, has fairly swept the country. We do not have to go by our own thoughts and guesses in the matter, but it is a point of record that some of the "best sellers" in the literary market today are works on health, treatises on ways to improve physical well-being, dissertations on better mental systems, etc.

There is nothing strange about this extraordinary activity in the direction of better bodies and better minds in the country. The singular part of it is that the milk dealers of the land have been so slow to take advantage of the condition. The National Dairy Council long was as "a voice crying out in the wilderness" to arouse the members of this industry to their opportunities in the direction of increased public health sentiment.

Yet, with the exception of leading minds here and there, comparatively few of our industry ever gave the council the proper support—this despite the fact that in all other industries of the food family, organized health publicity work was going on all the time, notably in the bread industry, the soft-drink bottling industry, the pickle, sauerkraut and canned goods industries, etc.

A man in Wichita, however, has been using his head for purposes other than a hatrack. He was working on the theory that the little rich kiddies of the nation, instead of being proper objects of envy, were if anything in worse condition than their friends of the poorer classes, insofar as regards health. This man, H. T. Corson, decided that through the welfare boards the children of the poorer classes were benefited much more largely than the others. Civic clubs and other organizations were taking care of those in homes where there was no wealth, making it possible for them to receive milk, figuring that their own "well-cared-for" children were all right, having everything money could buy.

"Upon coming to Wichita, in 1924," says Mr. Corson, "I found the same condition. A survey had been made and showed that about one-third of the school children were underweight, more than ten pounds underweight. Clubs had been organized and had raised a milk fund, and milk was being distributed in some of the schools mostly in the poorer districts, and underweight childre who could not afford to buy the milk were being served free from this fund."

He continued:

The school nurses, under the able leadership of Miss Gene vieve Lill, supervisor of health, had been doing a fine piec of work, but were not getting the co-operation they shoul from the schools in the wealthier districts.

Some times the best way to get one aroused is to step o their toes. I was invited to talk before one of the clubs o the city, and the chairman, in introducing me, told how thei club had raised money, etc., to care for the poorer childre of the city.

I complimented them on this wonderful work, but state that they would undoubtedly find more undernourished chil dren in the schools in the richer districts than in the poore districts, as they had taken care of them and let their ow children go.

Needless to say, I was criticised in the paper and other wise.

The nurses had just completed a careful survey of th schools for children of more than ten per cent underweigh and found that one school in the wealthier districts ha thirty-two per cent of children more than ten per cent unde weight, while one school of the poorer district had only nin per cent. These figures commanded attention, and from tha time the health work was much easier.

The first year's work was financed by the DeCou sey Cream Co. Lectures on milk for health wer given before the children of all of the schools, from th kindergarten up. A pair of guinea pigs, one had r ceived milk and the other had not, held attntion an put the lesson over in good form.

A series of free educational picture shows, featurin milk and dairy products for health, was also put on, wit good results.

"The results of this year's work was very satisfa tory, and the second year was financed by all of the pa teurization plants," said Mr. Corson. He then explaine

A program was worked out, in connection with the scho nurses, and the "Health Game Contest" was put on.

Cards were printed for each school child, credits giv for following the various health rules, and drinking at lea a pint of milk each day, each school was a unit, and the roo in that unit which had the highest per cent of points at t end of the contest received a nice picture as a prize, whi

New Series De Laval Separators

"Our New Series De Laval leaves only 1/2 of 1/100 of 1% fat in skim-milk"

For five months the De Laval Company has used this space to tell you in various ways that a New Series De Laval Separator in your plant will save enough butter-fat to quickly pay for itself.

Now let a user tell you about the skimming efficiency of these New Series machines. Mr. Wallace H. Gillette, manager of the West Branch Creamery Co., West Branch, Mich., writes:

"We have installed one of your New Series No. 70 Separators in our new plant here and it is skimming the cleanest of any machine that we have ever operated. Butter-fat tests on the skim-milk from this machine have shown that there is only ½ of 1/100 of 1%. We have used De Laval Separators for many years and the service you have rendered us has always been the best and is highly appreciated."

New Series De Lavals skim clean at any reasonable temperature when run at their full rated capacity and when producing cream of any density. Write for full details.

A New World's Standard of Skimming Efficiency

Using Graphs in Cost Accounting

Financial Activities May Be Expressed Logically in Graphical Form. Don't Depend on Your Balance to Tell You Whether the Year's Business Shows a Profit or a Loss

By PROF. H. E. REID*

THE increase in the size of our dairy manufacturing companies, from a one-man plant to the present day plants employing several thousand persons, and the development of greater competition in the business world have necessitated better and more complete methods of internal control. One of the outstanding control mechanisms which has received increasing attention in recent years is cost accounting, especially that part which has to do with the cost of manufacturing the product from the raw ingredients. It can be said that cost accounting, as practiced in our more efficiently operated plants, is essentially a part of the factory records and is a means of expressing, in dollars and cents, what goes on in the plant proper.

Unless one is entirely familiar with the detailed operations that take place daily in the factory he is not properly equipped to operate or direct the operation of a modern day cost accounting system. At the same time no one is adequately trained for this task unless he has working knowledge concerning general accounting methods. The cost accounts, to be of value to the plant executives, must synchronize with the standard financial accounts.

Often times the executives of our dairy manufacturing plants and the professional accountant are unable to understand one another, when delving into the cost records of the plant, particularly with regard to the way they are maintained. This difference of opinion can logically be said to be due to lack of familiarity, on the part of one or both parties, with the fundamentals of accounting or the detailed plant operations. Cost accounting is in reality simply a means of tying together the factory and the general accounts.

The executives of our modern dairy manufacturing plants are today searching for a system which will set forth, visually, the facts of the company's business in a condensed form. Figures have been used for many decades to indicate actual conditions in the production, manufacturing, sales and other departments of the average business house. Days and weeks have been consumed by the managerial force of our plants in compiling figures from vast amounts of data to demonstrate to the board of directors whether or not the respective companies have experienced a loss or profit for the month or year just closed.

The number of boards of directors who do not request an annual trial balance sheet, say nothing of the indifference accorded the annual statement of income and profit and loss are quite numerous. What is the reason for this lack of interest in behalf of these valuable instruments? Can it be that some few executives are satisfied to permit their bank balance to serve as an index of the company's financial condition? In some instances, the answer would be "Yes." The system of keeping an account of the business for this type of loosely operated firm is entirely inadequate. With such a system, of course, knowledge of the company's assets are not known at the beginning or the end of the business year. Money expended for equipment is not properly recorded. Inventories of the raw product, product in process, supplies, etc., are entirely unknown. When the end of the year arrives and the firm's bank balance indicates an increase of several thousands of dollars, some men are prone to believe that the increase at the bank represents the actual profits for the year's business. However, should a decrease appear, regardless of all improvements made in the plant, or extra supplies purchased or equipment installed and paid for as the cash became available, the assumption is that the company lost money and experienced an unprofitable year. These deductions are absolutely erroneous and the manager and board of directors are simply deceiving themselves by not knowing the true facts of the company's business.

It is one thing to operate and maintain a modern accounting system in a plant manufacturing one product only. It is another thing to operate and maintain a modern accounting system in a plant manufacturing two or more products. As the number of products manufactured increases the system of accounting used becomes more complex and intricate. Exacting knowledge of bookkeeping and accounts must be possessed by the persons charged with the responsibility of recording the company's financial operations. When the cost system applicable for more than one product has been devised and set up it is an easy matter to expand the system so as to include almost any number of products. In time it becomes so simple that it is difficult to go wrong in its application. As the system is expanded to include more than one article the cost of keeping cost records for each product is materially reduced. This remains true only as long as one class of articles are manufactured. When the company's interests are diverted and the classes of articles are enlarged, particularly if the products vary greatly, the cost keeping becomes much more difficult and expensive. Notwithstanding this, nearly all strictly dairy manufacturing establishments have fairly satisfactory cost accounts.

Unfortunately, no uniform cost system can be devised for the various dairy manufacturing plants throughou the country. A successful accounting system must be developed for each of the several by-products of milk or milk itself, and so arranged as to meet local conditions. There are, however, fundamental principles o great importance which are applicable to all systems i practice in dairy plants. These principles, however, ar not entirely recognized, at least they are violated dail in many plants, and until these misdemeanors are corrected, actual costs of operations and raw material throughout the plant are impossible.

A well conducted dairy manufacturing establishmen fears to have as its competitor one or several organizations which do not know their costs and do not care t know them. The danger of having such a competito lies in the possibility of this opposition underbidding firm which desires only a moderate profit on its sale The company operating with known costs has no re desire to see such competition go into bankruptcy, reali ing that a firm with less knowledge of costs may appe upon the horizon. These conditions entirely demorali business and they will continue until actual costs a own by all competing companies. This latter fore- ing illustration explains in part, at least, the cause for e remarkable variations in bids submitted for a cer- in patron's business, be it milk, butter, or ice cream. e conditions at all plants may be the same and still a riation in the bids of as much as twenty-five to thirty- e per cent is not uncommon.

---

* Associate Professor Dairy Manufacture, College of Agriculture, University of Missouri, Columbia, Mo.

What is at the foundation of so few accurate cost stems in our dairy manufacturing plants? In my dgment there are three basic reasons. The first is ually found present in the medium-sized or small plant. e system followed is entirely inadequate, due to the anager's lack of cost information. He is usually a man ho has started out in a small way keeping a very ordi- ry set of accounts. Fair success in his endeavor to cord his costs was attained because of his intimate owledge of every detail of the work. As his business veloped he employed men who could perhaps keep oks but lack of working knowledge of the plant and preciation as how best to set up a system suitable to s particular plant. The manager is too busy to notice at keen competition is about to, or has, crept in, de- anding that he account for the expenditure of every nny. His records are unable to do so. He concludes at an elaborate accounting system is unnecessary, as s past successes did not require such. One thing he es understand is that modern equipment is essential here a quality product is demanded. This was learned years of cold, practical experience. Although he may vn and operate the most modern plant in the commu- ty, from the standpoint of plant structure and equip- ent, he remains out of date with his methods of keep- g his costs. This is not his loss and he cannot be made realize that a modern cost system is a pecuniary ad- ntage or profit. He is, therefore, a liability and a umbling block to the industry.

The second basic reason which may explain why cost stems are inadequate, is due to the fact that some- mes a manager erroneously believes himself to really progressive regarding his cost records. He has given nsiderable of his time to reading articles treating on st keeping or has heard a discussion of a very modern stem. The bookkeeper to whom this task is assigned nerally had made no special study of the subject and proves the present system by adding a few forms used some other firm. Quite frequently, no improvements e made and the additional forms are simply useless ports. The bookkeeper, however, states that decided nefits have been attained by the addition of these new rms. The manager, who is little interested in account- g and knows but little of cost keeping, accepts the atements regarding the reported improvements and is parently satisfied, though no improvement has actually en made. Indifference to modern cost systems is a bility to the plant and must not be tolerated.

The same plant executives who have been impressed th the value of cost systems and observed the decided ed for the improvement in their cost systems employ perts to re-construct their system so as to meet their eds. Many of these men who are experts in their par- ular field have no appreciation of the operations that ke place daily in the plant. The result is that the so- lled improvements are really impractical, inasmuch they are not best suited to the business and represent compilation of unnecessary records. Where is the viding line between cost keeping and accounting? Cost eping as it is understood is only concerned in giving, a direct way, the cost of everything that enters into e make-up of the total cost of the product. To be of al value to the manager, these costs should be so recorded as to display at once all excessive costs, whether they be direct costs or an element of the expense burden. Scientific plant management and effective cost keeping are inseparable. Without accurate costs of all phases of the plant operation, efficient management cannot exist. The true function of costs is to assist in obtaining better management, increased efficiency and a true reduction in the cost of manufacture.

Assuming that the average dairy manufacturing plant is conducted on a very efficient operating basis, the cost records and general accounts are sufficiently detailed to furnish necessary information as to the costs from production through to completion of details involved in selling the finished product and closing out the transaction as far as the records are concerned.

The board of directors call for a report of the company's business each month. What is the best method to follow in presenting the report to the board so that it appears logical and can be comprehended with ease by all members. The method of presentation is of the utmost importance. Some executives require a detailed record of all operations while others request only a statement of the outstanding facts which relate to the prevailing financial and operating conditions.

There are four general methods now used in presenting, accurately, accounting data to executives. The first is the written report, which may be brief or detailed, depending on the enormity of the business, whether one or more products and departments are involved and the type of report requested. This form is most commonly used and is often strengthened by the use of tables representing a compilation of much data. The second method is to present a report made up entirely of tables with or without written explanatory material. The facts are set forth in cold figures and when properly arranged represent the true condition of affairs. The third method is by the use of graphs which, during the last few years, has grown tremendously in its popularity among executives. In its use and application it is possible to represent in graphical or pictorial form, the relative changes in the business that take place with the process of time.

The fourth method may be described as a combination of the three preceding methods. This latter method is used principally when lengthy reports are necessary and by heavily financed enterprises.

The graphic charts are becoming more effective because they appeal to the mind of the executive through the eye. Graphic charts can be made to present a clear, definite, businesslike picture of the manufacturing costs, dividends, profits, sales, material costs, inventories, cash balances, payroll analysis, advertising, collections and many additional phases of the business, all of which are of direct importance to those charged with directing of the organization's progress.

The reason for the increased popularity of this style of report is that when facts are stated in shape of a curve these facts are more deeply impressed upon the mind because the shape or trend of the curve can be remembered. A mental picture is obtained which is lasting. A curve is much easier to remember than is the trend of a vast column of figures and data. It is indeed surprising how mentally economical and convenient this procedure really is. Fatiguing of the mind is almost eliminated, since the grasping of the necessary facts, memorizing the same and the mental classification and comparison are performed without the necessity of but several mental processes which are absolutely necessary when figures are used to convey the same information. The shape of a curve imparts a mental picture of the trend of your sales, corresponding to a definite period, without translating figures into a particular mental conception that best fits the wants of our mentality. Then, the active business man can, with greater ease, absorb or incorporate in his mind a larger number of curves in the course of a day's work, and retain a mental picture of them, if he does so through the medium of graphic charts than if he resorts to tables of figures. This is a scientifically proven fact concerning which there is no question.

The constant use of graphic charts prompts and develops analytical thinking and investigation of every phase of your business. In the case of cold figures they are at times very fatiguing and bewildering.

The efficient manager requires that daily reports of the business be presented to him to be analyzed and compared. When these reports are prepared graphically the executive can know at a single glance the condition of that particular phase of the business. A perfect picture of the events of his business stands out clearly before him and suggests constructive procedure as to what action is necessary.

The use of graphic charts is without question the last work in statistics, for usually after a table of figures has been compiled the next logical step is to illustrate their value and the use of charts is usually resorted to. It is absolutely necessary to analyze the existing conditions. A sudden decrease in the company's profits, or a rise in the cost of manufacturing, demands an immediate explanation.

The following are several simple illustrations whereby a comparison of the same facts are set forth as a table of figures and then in graphical form:

Table No. 1—Showing Gross Market Milk Sales Over an Eleven Year Period.

Year	Gross Sales	Year	Gross Sales
1915	$25,000.00	1921	$53,000.00
1916	37,000.00	1922	64,000.00
1917	46,000.00	1923	71,000.00
1918	61,000.00	1924	76,000.00
1919	67,000.00	1925	93,000.00
1920	58,000.00

itions as they exist, assuming, of course, that the source f the information is accurate. The company's financial ctivities are made clear, concise and in a business-like orm.

There is no limitation of the cases to which graphical resentation of financial facts or other facts desired in ne plant to be used by the executive in charge. Items f interest can be charted at intervals of days, weeks, ionths, or years, completed to afford the most efficient ontrol. In addition to the illustrations presented, the ollowing is a list of charts which are very essential for fficient control and are suggested only as a means of iving opportunity of familiarizing oneself with the possibilities of the graphic method of presenting statistics, uch as labor, rate of wage, material prices, supply prices, emperatures, accounts receivable, collection, accounts ayable, labor turnover, unit costs of production, progess charts, costs of manufacturing, cost of packing and hipping, cost of lighting, heating, performance of salesien, advertising inquiries and results obtained from dvertising.

No matter how small the business of a company may e, some consideration should be given to a method of resenting the facts in a graphical form. The smaller he organization the system would relatively be more mple when compared to a large, complex and complete ystem of a million dollar corporation.

WE EAT LESS AND WANT IT PLAIN.

Where are the red roast beef and the mallard ducks yesteryear?

They're in sandwiches, to be washed down with ottles of milk, aboard the dining car of the present ay, says A. E. White, commissary chief of the Chicago, urlington & Quincy railroad, who recently completed iirty years of serving patrons.

"Twenty-five years ago," said the amiable superchef, people ate much more than they do nowadays. A meal as an occasion. They ate red meat and beefsteaks and sed whiskey to work up an appetite. And they ate allard ducks, black bass, pies and plum puddings.

Eat Less and Want It Plainer.

"Today they eat less and want it plainer. A ndwich and a glass of milk constitute a luncheon for iousands of travelers."

A Thoroughbred Thief

Milwaukee milk dealers were put to their wits' end recently to locate the cause of complaints of non-deliveries of milk. The milk companies sent out investigators but they and several policemen failed to locate the cause.

At last a Milwaukee housewife, on going out to get her morning's delivery of milk, saw a police dog slink up, get the bottle of milk in his teeth and run off. A member of the local humane society was detailed to capture the thief.

The dog was finally captured after being forced out from under an old barn where he had made his home. He proved to be the property of a prominent citizen who had given up his valuable dog as lost.

Guilty — Police dog vag captured after stealing milk bottles from consumers' porches. (Photo by Milw. Journal.)

A large number of milk bottles was found under the barn. The clever animal would lay the bottle down and poke his paw into the cap until it was forced out. He would lap up the milk as it flowed from the bottle.

Being a highly intelligent dog, he was apparently familiar with the superior food value of good milk and no doubt felt the need of the vitamines contained therein. Anyway, it's a dog-gone good story, and a true one, too.

MOURN SUDDEN LOSS OF CANADIAN DAIRY LEADER.

The dairy industry is mourning the loss of one of its counsel, D'Arcy Scott, who for seven years has been directly concerned with the advancement of Canada's dairy industry. He was active up to the day he died, as general counsel, secretary and treasurer of the National Dairy Council of Canada.

Among the Canadian council's achievements under his guidance were: Prevented increased rates on milk shipments, both in baggage and express cars, and a similar service for the cheese shippers; secured legislation against oleomargarine in Canada; secured removal of sales tax on milk powder, condensed milk and ice cream; conducted milk campaigns in many provinces of the dominion; prepared and distributed large quantities of educational literature and many other acts to warrant the favor of the dairy industry among Canadians.

On the day of his death Mr. Scott dictated a letter to the National Dairy Council at Chicago but did not live to sign it. His council used much literature and many health education projects of the National Dairy Council and its president had been invited by Mr. Scott to address the annual meeting of the Canadian council in November.

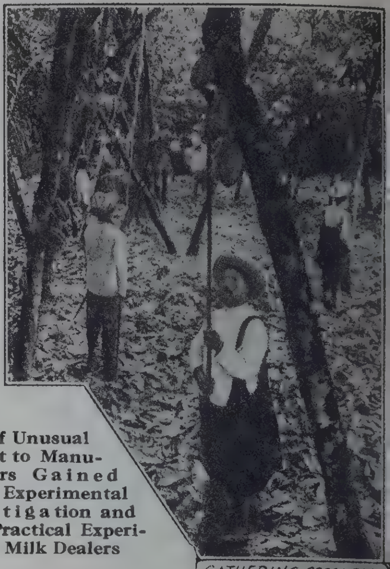
One of the best milk slogans we have heard in many a day is employed by the Franklin Co-operative Creamery Association, Minneapolis. They urge their customers to "Co-operate With Health—Drink Franklin Milk."

Methods of Processing Chocolated Milk

By F. J. DOAN
Assistant Professor of Dairy Manufacture, the Pennsylvania State College*

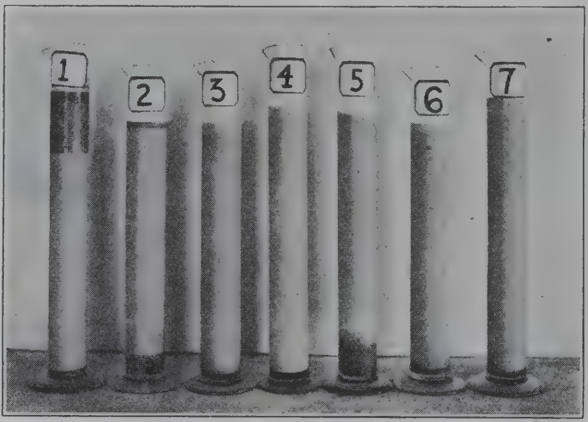
Facts of Unusual Interest to Manufacturers Gained From Experimental Investigation and From Practical Experience of Milk Dealers



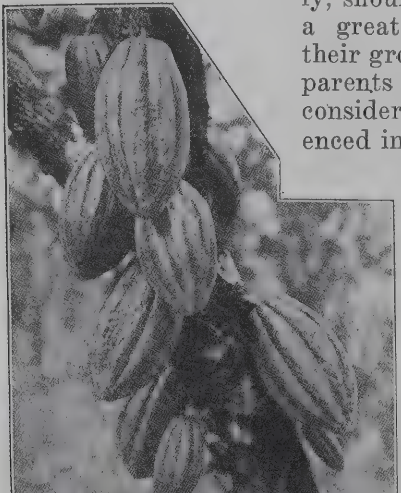
GATHERING COCOA PODS

CHOCOLATE milk is a fluid milk drink that has been gaining in popularity in many sections of the country. Formerly its sale was restricted almost entirely to the soda fountain, but in the last few years many milk dealers have found it a profitable side line to carry on their regular milk routes. Some dealers have also worked up quite an extensive wholesale trade with restaurants, cafes, roadside stands, soda fountains, etc. Most of the milk, whether for wholesale or retail outlets, is bottled in the regulation one-half pint milk bottle, the price to the consumer being in most cases five cents per bottle.

Essentially this drink is fluid milk containing a chocolate flavor (usually cocoa) and enough sugar to give a pleasing taste. Many dealers prepare their own chocolate syrup from cocoa, water and sugar while perhaps a greater number purchase the syrup already prepared under various trade-marked names. Some of these names have been nationally advertised, and the user of the flavor receives exclusive right to the name in his territory, paying a royalty on the amount of drink sold in some cases, and in others simply purchasing the flavor from the concern owning the trade mark.



Chocolate milk finds a real demand in the fact that many persons who dislike milk itself and who realize the benefits to be derived from it can drink chocolate milk with relish. Children, especially, should be required to drink a great deal of milk during their growing period, and many parents have found that where considerable trouble is experienced in getting the youngsters to consume their quota of milk, because of their dislike of the flavor, no trouble is experienced in persuading them to drink chocolate milk. It has also been found that even with persons who like milk and drink a considerable amount, the availability of the chocolated drink allows more variety and more milk is consequently used.



COCOA PODS

A questionnaire was recently sent representative milk dealers in the northeastern states regarding chocolate milk. Twenty seven replies were received. Eleven dealers, representing both large and small establishments, made and sol chocolate milk in some form. One dealer sold the chocolate milk to his customers who mixed their own drin as they wished. Fourteen dealers, two of whom had a one time made and sold th product, were not making it a the time of inquiry. This survey shows that the sale of chocolate is becoming fairly genera and if the concerns replyin can be taken as representativ of the market milk industry i this section, it is safe to assum that at least one-third of th dealers are selling this produc It must be admitted, howeve that the manufacture of chocolate milk by the milk dealer more general in the smalle towns and cities than in th larger ones. Before discussing experimental results obtained in the mixing and processing of chocolate milk, might be well to show the diversity of opinion regardin this product as shown in answers to the questionnair

Of the eleven dealers selling this product, eight so only retailed bottled chocolate milk, two sold only wholesale and one sold both at wholesale and at reta Two sold some in bulk at wholesale.

In answer to the question regarding complaints fro the trade, seven claimed there were none, two admitt complaints on the keeping quality and two said the were complaints on the appearance due to cocoa sediment and an unsightly cream layer.

It was asked if the dealer believed a cream layer be objectionable. Six said "yes," and five said "no" When asked why it was objectionable—of the six—fi said because of poor appearance and one did not answ Of the five, however, three claimed the cream layer be darker than the main body of product and two sa it was lighter.

Four dealers were preparing their own syrup a seven purchased the flavor ready-prepared.

Concerning the fat content of the product, two mak used whole milk, four standardized the product to t

"Only Gaulin can build a Gaulin"

Chocolated Milk Made Smooth

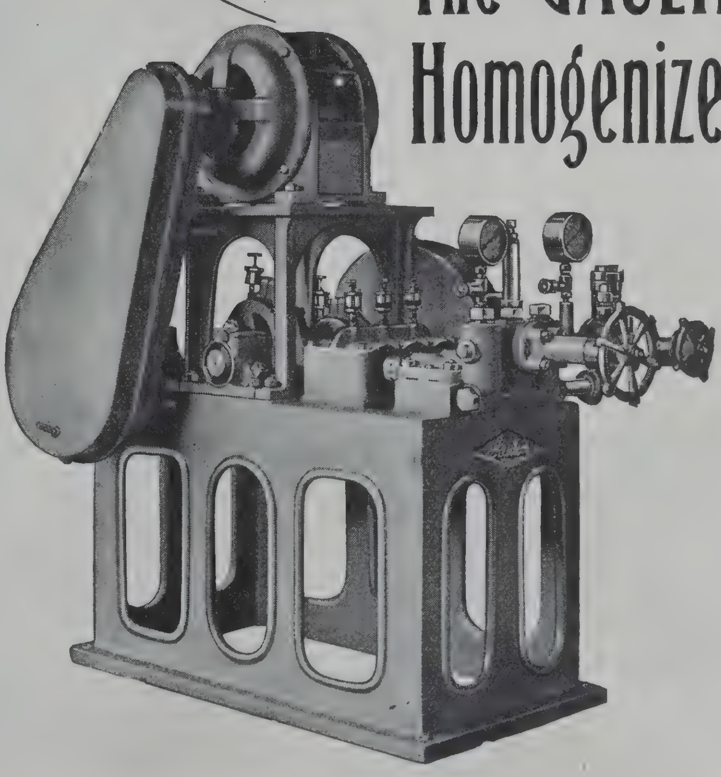
nd uniform from one day to nother, also more palatable y merely passing it thru a

GAULIN HOMOGENIZER

efore bottling. Having done is, you need have no anxiety bout the syrup settling out or e cream rising to the top. The hole contents of each and very bottle will be uniform and will stay uniform.

Dear Sir:—We are having considerable difficulty in getting chocolate syrup to be completely soluble and to mix in with whole milk without a sediment taking place.

The GAULIN Homogenizer



Gaulin Homogenizers are made in many sizes.

Send for our interesting booklet on the Gaulin Homogenizer and ask about its application to Chocolated Milk.

Ianton-Gaulin Mfg. Co.
Elkins St. BOSTON, MASS.

per cent and five used half whole milk and half skim milk.

Six dealers pasteurized the milk before adding the syrup and five pasteurized the product after mixing.

Four of the eleven answers stated that the homogenizer was used. All four of them homogenized the product after the addition of the syrup. The pressures used varied from 2,000 pounds to 3,000 pounds, and the temperature from 80 to 120 degrees F. The remaining seven did not use the homogenizer. The question was asked, whether it was believed that homogenization decreased the sediment formed. Three answered, "yes"; one, "probably not," and two, "no."

All of the answers stated that the product was bottled by machine. Seven stated that there was no trouble experienced with cocoa settling in the bottling machine hopper. Four stated that they did have much trouble, one of whom said, "A man stirs the chocolate milk during bottling."

In answer to the question, "Does the cocoa settle quickly after bottling or after several hours?" the answers were as follows: Three said, "quickly"; four said, "after several hours," and four said, "in about two hours."

The question was put as to whether some brands of cocoa or syrup gave better results than others regarding settling. Six replied that they did; four said that they did not know, while one reply stated that four different brands of cocoa and three different prepared syrups had been used and the results were almost identical where the product was treated similarly and contained approximately the same amount of flavor.

Eight replies claimed there was a worth-while demand for the product, two were doubtful and one said there was not. In addition, of the dealers who did not sell the product, six gave as their reason the fact that the demand was not worth while. All admitted the demand to be greater in the summer, and three stated that the sale of chocolate milk aided in the solution of their surplus problem.

From the above answers it can be seen that there is considerable variance in the manufacturing process for chocolate milk as well as a difference of opinion regarding the value of it from a sales standpoint. The latter, of course, would be expected due to the fact that in some localities the drink is well recognized, while in others considerable advertising will be necessary if a sufficient demand is to be stimulated.

Because of the great lack of any common procedure in making chocolate milk, the difference of opinion existing, and the large number of inquiries received regarding the processes to use, some experimental work was undertaken in an effort to ascertain the effects of different treatments on cocoa separation, cream separation and general quality.

Whole Milk vs. Skim Milk.

Four lots of chocolate milk were prepared from skim milk, two per cent milk, four per cent milk and six per cent milk, respectively, as the base, using the same amount of a chocolate syrup flavoring in each case. These lots were examined before and after pasteurization, before and after homogenization at various pressures and before and after heating to 160 degrees F. for 15 minutes.

In all cases the product made from the six per cent milk was judged the best flavored drink and the one having the most pleasing "body" and appearance. The product made from four per cent milk was judged second best followed by that made from two per cent milk. The product having skim milk as a base was noticeably darker in color, thinner in appearance, and had a watery taste. A very pleasing "milk chocolate" flavor v noticed in the higher fat samples which was distinc lacking in the product made from skim milk. From t trial it was concluded that a high quality chocolate m can only be made from whole milk or milk contain not less than three per cent fat.

Effect of Cocoa on Quality.

Several different brands of "dutch process" co were used in another trial series of samples in order determine the effect of different makes of cocoa. Th samples were then compared with three samples p pared from commercial chocolate syrups and pas made up according to directions furnished with the voring material. The drinks prepared from the coc had roughly about the same intensity of flavor but quality of flavor differed in that some seemed to be so what reinforced with spices or vanilla which gave a tinct difference to the taste. It was not possible to that one was particularly better than any of the oth Personal preference varied and all were of pleas flavor. More difference was noted in comparing drinks made from the cocoa syrups with those m from commercial syrups and pastes. The latter ha more intense flavor, and the suggestion of spices flavors other than chocolate was more noticeable. H ever, nothing was known about the proportion of co to milk in these samples and in two of them it was lieved that "chocolate liquor" had been used rather t cocoa as a source of the flavor. The only thing that be said regarding the effects of different cocoas on flavor of chocolate milk is that all of them used in study produced a pleasing drink, how pleasing depe ing on personal preference.

Methods of Handling and Processing.

In the following studies three brands of cocoa w taken as being fairly representative and were used in trials made for comparison unless otherwise no Where the method of preparing the chocolate syru not mentioned, the following formula was used:

1 lb. cocoa   7 lbs. sugar   2 qts. water

The sugar and cocoa were thoroughly mixed a which small amounts of water were added successiv with constant stirring, forming a paste which then solved itself to a smooth viscous syrup. This was he to 180 degres F. and held for 30 minutes before cool

This syrup was mixed in the proportion of one of syrup to seven parts of milk by weight. The stu in this group were made primarily to note the effect cocoa sediment formed and cream layer.

Pasteurization Temperature.

Samples of chocolate milk prepared from the t brands of cocoa were allowed to stand in 250 CC. c ders for 12 and 24 hours at 50 degrees F., after w the amount of sediment deposited and the depth of cr layer formed were measured. The samples were e ined in the raw state and after pasteurization at 14 grees F. for 30 minutes, 155 degrees F. for 20 min 170 degrees F. for 10 minutes and 190 degrees F. fo minute. The results are given in Table I, and show ra definitely that higher heats in pasteurization reduc amount of the dark colored cream layer rising to top of the milk but increase the amount of cocoa ment deposited. The latter is a detriment, while former is an advantage.

In these studies it was noticed that samples sho a heavy sediment deposit were lighter in color thr the main body of liquid than samples having lesse posits. Holding the samples for 24 hours, instead hours, generally increased the cocoa settling bu

Iowa Dairy

found it easy to increase Milk Sales 30%

THE Superior Dairy Co., Davenport, Iowa, uses this recipe to build greater sales!

> *"We find that the campaign on "A Bottle of Milk Is A Bottle of Health" has increased public interest in milk as a health food, and has resulted in increasing the consumption of milk by both old and young. Using Thatcher Posters on our wagons and tying-up to Thatcher Bottle advertising in The Saturday Evening Post and Good Housekeeping Magazine has been profitable to us. Our milk sales increased in one year 30%!"*

What the Superior Dairy Co. is doing, dairymen all over the country are doing. The average increase in milk sales last year among Thatcher Bottle users was 23%! Were you among the money-makers?

"MORE TRIPS PER BOTTLE"

The most important item in buying milk bottles, is the final cost per bottle to you. The first cost or purchase price means little or nothing to you. From the actual experiences of dairymen and from exhaustive laboratory tests, it has been definitely proved that Thatcher Superior Quality Milk Bottles will give you more trips per bottle. For Thatcher Bottles are tougher, more uniform in quality, have a better distribution of glass, and consistently perform better in actual service than any other bottle made.

Specially designed lehrs, used exclusively by Thatcher, help to give Thatcher bottles that superior quality and wear-resisting toughness not found in ordinary bottles. The Thatcher Trade-mark is blown on every Thatcher Bottle for your protection and guarantee.

Then too, millions of milk users see and read the celebrated "A Bottle of Milk Is A Bottle of Health" advertisements of Thatcher Bottles in The Saturday Evening Post and Good Housekeeping Magazine. If you want to increase your milk sales, fill in and mail the attached coupon. It will pay you to act at once.

THATCHER MANUFACTURING CO., Elmira, N. Y.
Operating several plants throughout the country, each strategically located and devoted exclusively to making Superior Quality Milk Bottles. Prompt, efficient service—always.

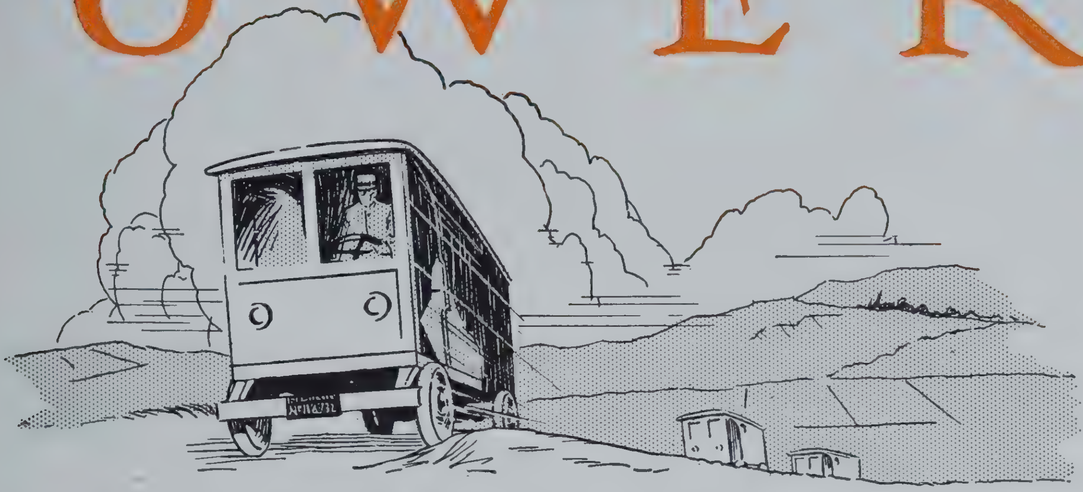
POWER!



an Edison Battery Characteristic

Ten years ago in the "hill city" of Pittsburgh, a little less than thirty per cent of the electric street trucks in use were equipped with Edison Batteries.

Today, over sixty per cent are Edison Equipped.

In Kansas City, another territory with severe grade conditions, ten years ago, Edison Storage Batteries furnished the power for only forty-three per cent of the trucks then in service.

Today, nearly eighty per cent of all street trucks in this section are operated by Edison Batteries.

Battery characteristics have given Edison this great preference—*power:* the power reserve for hills and heavy going in snow clogged streets, *dependability, long life and low costs*—these are the important things to consider.

Our nearest representative will be glad to tell you more.

Gentlemen:

Will you kindly mail us 12 copies of your catalog #673 New Standard Series, Dairy Edition 1927. We find this booklet very beneficial for our drivers to carry with them when soliciting new business. The article on page 8 is a wonderful help to a driver when soliciting business from a competitor using metal lined equipment.

Upon my return from the Dairy Show, I handed a copy to one of our drivers who immediately started after business using this booklet to back up his sales talk and it worked out fine. I am so much impressed with the results that I want all our drivers to use one of these booklets in the same manner. Thanking you for the above favor, I remain,

Very truly yours,

Ryder's Dairy

By A. M. Ryder.

An unsolicited letter which demonstrates the sales value of having glass lined equipment in your plant.

AND TO THINK WE USED TO COAX HIM!
MORE MILK!
ONE MORE CUPFUL EGBERT, AND THAT'S ALL. MAMA DOESN'T WANT YOU TO DRINK TOO MUCH!
IS THREE QUARTS ENOUGH, MRS. JONES?
BABY

Why Mrs. Jones Increased Her Milk Order

Milk is the best food for the growing child—but what if he doesn't drink it? What can the milk dealer do about it? The baby is rightfully a customer of his—yet refuses the privilege.

Here's what to do, dealers! Sell the family a jar of delicious Chocolated Dairy Drink Syrup. Then you'll find the baby can scarcely get enough milk to satisfy him. In thousands of American homes this has happened, with better health to the children and more profit to the dairyman.

You can handle Chocolated Dairy Drink Syrup two ways—as a sideline for the customers to mix, or mixed and bottled by yourself. Either way, there's a real profit.

Have you seen the "Milk-cap Booklet"? A hit with milk dealers for the business it brings them. Send for sample of both D. D. Syrup and booklet.

DAIRY MANUFACTURING SHORT COURSES AT PENNSYLVANIA STATE COLLEGE.

For the thirty-fourth year the dairy department of the Pennsylvania State College will offer short courses in dairy manufacturing. These courses and their dates are listed below:

1. Testing dairy products and the manufacture of butter and cheese. January 6 to 21, 1927.
2. Ice cream making. January 24 to February 4, 1927.
3. Market milk and milk condensing, February 7 to 18, 1927.

These three separate courses, each continuing for two weeks, have been scheduled to replace the eight weeks creamery course given in former years. Under this plan men who found it impossible to be away from their plants for eight weeks will find it profitable to spend two weeks in gaining information in their particular field of work. It would be advisable for those who have had no experience in creamery work to take all three courses.

During the past thirty-three years over eleven hundred young men have been trained at State College in various lines of creamery work and are now filling positions in dairy plants throughout the country. While the college does not agree to find positions for students, the demand, at good salaries, for men who understand the principles which may be learned in these courses, and who can put them into successful practice in the plant, has always exceeded the supply.

The Pennsylvania State College maintains the largest commercial college creamery in the country. This creamery, in the dairy building, is in operation throughout the entire year, and manufactures every dairy product except milk powder. It is in this creamery that the student puts into practice the theories of the lecture room.

Cost of Courses.

In addition to traveling expenses there is a registration fee of $10.00 per course. Board and room cost from $9.00 to $10.50 per week. Students may bring their own white suits, thus saving the expense of buying them.

Anyone interested in the above courses who desires further information should write Professor R. G. Bressler, Director of Instruction of the School of Agriculture, The Pennsylvania State College, State College, Penn.

Work Covered in Courses.

Course No. 1—January 6 to 21, inclusive.

The work covered in this course includes the testing of milk, cream, buttermilk, whey, for butterfat; the testing of butter for moisture, fat, curd and salt by the Kohman method; acid testing, testing milk for solids, standardizing of milk and cream, calibration of glassware, the churning process, standardization of composition of butter, overrun problems, butter defects, the making and propagation of starters, plating for bacteria, the manufacture of cheddar, cottage and cream cheese.

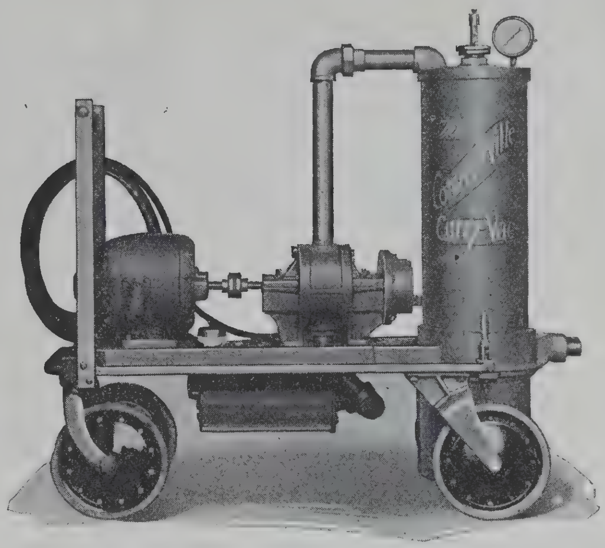
Course No. 2—January 24 to February 4, inclusive.

Much of the time will be spent in calculating ice cream mixes and in freezing ice cream in the college creamery.

Course No. 3—February 7 to 18, inclusive.

This course will include lectures and laboratories in the chemistry of milk, clean milk production, dairy farm inspection, pasteurization of milk, testing for adulteration, cream line studies, testing for quality, separation of milk, transportation of milk, making soft cheese, chocolate milk drinks, cultured buttermilk and sour cream, the operation of the vacuum pan, making plain and superheated condensed milk.

Real Machines
for an
Important Job



Connersville Curry-Vacs increase profits by keeping both horses and cows thoroughly clean. They do the cleaning at a lower cost. When Curry-Vacs are used, the grooming is done in about half the time that it takes for hand currying.

Both horses and cows are more healthy, better spirited, and present a finer appearance, when they are kept thoroughly clean with Connersville Curry-Vacs.

These machines make money by reducing the help required in the stable. Curry-Vacs also reduce veterinary and medicinal expenses. Both horses and cows are more healthy and less likely to become disabled through sickness. Curry-Vacs are "all-around" money-makers because conditions in the stable are generally bettered. Grooming is not only easy and speedy but it is no longer disagreeable. There is no dust flying in the air.

Send the coupon and let us give you more complete information.

Is Ammonia Combustible?

Are You Going to Be Afraid of Ammonia Hereafter? I'm Not.

By W. F. SCHAPHORST, M. E.

THERE still are some dairymen left who are afraid of refrigerating machinery because they think that ammonia is combustible. They think that ammonia burns like gasoline or kerosene, and that it explodes like dynamite.

False reports have been spread, not only through newspapers but through business and technical papers, whose editors should know better. So, under the circumstances, those dairymen who have been misinformed can hardly be blamed for feeling shaky about using ammonia.

Not long ago a client put the same question up to me. I had read a positive declaration shortly before, in a "technical" engineering paper, that ammonia IS combustible under certain conditions. And at about the same time I heard a vehement denial by a man who had been in the ammonia business most of his life.

Lacking the facilities for making exhaustive tests myself I did what I believe nobody else has ever done: I wrote to all of the foremost chemists in the United States, all of the leading engineering colleges, and all of the big manufacturers of ammonia and ammonia machinery. I made the question just as plain as I knew how to make it.

Feeling that excerpts from the replies received will prove of value and interest to dairymen, I am reproducing them herewith.

As will be noted, I have endeavored to divide the replies into two divisions—"Yes" and "No"—but it is difficult to do so on account of the conservatism to be found in a number of the letters.

The extracts, verbatim, are as follows:

One of the following came from a director of chemistry; one from the "department of chemistry," without mention of title; and the other four came from the professors of chemistry. All are from large universities:

"Pure dry ammonia will not burn in the air. It will burn in oxygen."

"I believe pure ammonia gas will not burn as a jet of gas in air, but will explode mildly when mixed with pure oxygen and ignited. It will burn if passed into a flame of some other burning gas, but its own heat of combustion is not sufficient to maintain the ignition temperature in air."

"Pure anhydrous ammonia is **not** inflammable in atmospheric air, but can be made to burn **in pure oxygen.** In regard to the combustibility of ammonia in oxygen see Roscoe and Shorlemmer's Treatise on Chemistry, vol. 1, page 505 (1911 edition.)"

"In the ordinary sense in which the word is used, anhydrous ammonia would not be properly spoken of as an **inflammable** substance. The word **inflammable** here used implies 'capable of burning when in the presence of or mixed with air under ordinary conditions.' The word **burning,** as used above, signifies progressive combustion without the introduction of external heat and in the absence of a catalyzing substance.

"Anhydrous ammonia is, however, **combustible.** That is, when mixed with pure oxygen or with air to which has been added an excess of oxygen, it will burn with the production of a flame, and it can also be oxidized readily when mixed with air in the presence of a catalytic agent or at artificially maintained elevated temperature."

"No information that I have available here would indicate that anhydrous ammonia is inflammable and, **personally, I have considered it to be absolutely non-inflammable,** even under excessively high pressure and in the presence of oxygen."

"A jet of ammonia gas escaping into the air at low velocity will burn in the air if a flame is held in contact with it. Combustion will cease when the flame is removed. If, however, the ammonia jet is surrounded by a larger tube through which oxygen is passed, the ammonia gas will burn in the atmosphere of oxygen if its velocity is not too great."

The chief chemist employed by the department of safety in a large American city wrote this:

"I have never found pure NH_3 to be combustible in any degree, in fact, we have several instances of its liberation extinguishing fires in a building.

"There are records of explosions resulting from this gas but on investigation it has been found that disassociation had occurred and the hydrogen of the ammonia molecule exploded when it became mixed with the oxygen of the air.

"I have just had a case where an explosion occurred in a refrigerating plant when the gas was accidentally liberated, carrying with it a large percentage of oil vapor which ignited from an open fire in the room, causing the explosion, but it was the oil vapor that exploded and not the ammonia, the latter having the effect of extinguishing the fire on different objects in the room, before the arrival of the fire department.

"Text books claim that the pure gas will burn in pure oxygen, but that it is extremely difficult to ignite it in the air.

"The liquified gas often expands and bursts its containers which are called explosions, but fire resulting therefrom is rare."

The chairman of a prominent engineering research committee wrote:

"Our Dr. —— of the department of electro chemistry states that ammonia will burn in oxygen, and whe passed over a catylist with oxygen, nitric acid will b formed. In air, although it may be lighted, combustio will not continue. The ammonia in a closed system o a refrigerating plant will probably contain gases fro disassociation and **from the oils which are hightly inflammable and explosions may occur."**

A well known manufacturer of refrgeratng machinery wrote:

"We have never heard that pure ammonia is inflammable and we do not think that it is considered so b any of the railroads or insurance companies."

This came from a professor in a large engineerin college:

"Ammonia vapor unmixed with air is entirely iner One pint of ammonia vapor with about four parts of ai will burn if heated at atmospheric pressure and will for

USE TWO
CHESTER BARREL HEATERS

One at their Flora, Indiana Plant

At this plant a No. 4 Chester Barrel Heater, having a capacity of 9,000 lbs. per hour, is used as a preheater before their glass holding tanks for sweet cream. All the heating is done by the Chester, the tanks being used merely as holders.

A similar installation can be made in your plant without changing your other equipment. No motors, pumps, or other special apparatus are required with the Chester Barrel Heater.

One at their Sheridan, Indiana Plant

Here a Chester Barrel Heater is giving consistently satisfactory service in solving a somewhat different problem. At this plant they use a No. 7 size delivering a continuous flow of 20,000 lbs. per hour as a preheater for their cream separators.

Chester Barrel Heaters are solving the heating problem in all sorts of milk plants all over the country and we would be interested in helping you solve yours.

We can furnish a complete line of modern dairy equipment and milk handling machinery. Write us for detailed information and prices.

nitrogen and water vapor. I do believe that ammonia and air if in the proportion given above will not stay ignited if issuing from a jet, and it would take very considerable adiabatic compression to ignite the mixture. If air and light hydrocarbon vapor along with ammonia were compressed suddenly an explosion would doubtless result, **but not due to the presence of the ammonia.** On the contrary, the ammonia would probably act as a dilutent. I have to be very particular about the quality of the lubricating oil I use in my liquid air compressor plant. A too volatile oil will cause ignition."

The following seven replies from manufacturers of ammonia are negative:

"Anhydrous ammonia is not considered an inflammable material. When contaminated with oils, greases and gases, it is the inflammable matter of the contamination that ignites rather than the ammonia."

"We believe that anhydrous ammonia is not inflammable in itself under any conditions, but is, of course, explosive as is any compressed air."

"It is a well-konwn scientific fact that ammonia gas can be burned in pure oxygen, and it will maintain a flame in air if a high enough temperature exists. The reaction is, however, a very feeble one and the tendency of the flame would be to go out.

"**If enough oil or other gases were present to maintain a suitable temperature, the ammonia gas would probably burn and the combustion sustain itself.** The question of the inflammability of ammonia has, to my knowledge, never been brought up before and is not a serious factor in its use."

"Anhydrous ammonia is not inflammable under the commonly accepted term, and is accepted and shipped on the railroads with the non-inflammable green labels."

"Pure ammonia is non-inflammable and is so designated by the bureau of explosives, carrying a green label and accepted by all common carriers."

"Pure NH$_3$ is non-inflammable in air in the sense that it will not sustain its own combustion. If a jet of pure NH$_3$ is blown through the flame of a bunsen burner or other source of heat of high temperature it will ignite and remain burning so long as the bunsen is kept in position. On removal of the bunsen, however, the flame will immediately go out."

"We believe that pure ammonia gas is not inflammable. A Dr. —— claims to have established the fact that a mixture of ammonia gas and air in certain definite proportions is explosive. This we doubt, but even if this statement is correct, it would have nothing to do with the inflammability of ammonia gas.

"Explosions have occurred through the bursting of **cylinder heads on compression machines where ammonia** was spread into the air, intimately mixed with oil from the compressor, **which oil, evidently mixed with air,** caused an explosion and fire."

A well known authority on refrigeration wrote this:

"Anhydrous ammonia is not inflammable except under conditions which are causing it to decompose into elementary gases of hydrogen and nitrogen, the hydrogen component being proportion of three atoms to one of nitrogen which is inert, makes it very inflammable and explosive when combined with the oxygen of the air. The temperature required from decomposition of ammonia under normal conditions is between 900 and 1,000 degrees F. Where catalytic conditions are present it has been known to decompose slowly at temperatures at, or near, 500 degrees F. When contaminated with oil,
greases, etc., it is usually the hydro-carbon gases fro
the oil which is the inflammable element rather th
the ammonia."

A chemical engineering consultant wrote this:

"Ammonia is not combustible. A flame is exti
guished if plunged into a gaseous space containing on
ammonia. If ammonia is mixed with oxygen, the
sultant gas may be ignited and it will burn with
yellowish flame with the production of water vap
nitrogen and nitrogen oxides. The burning of air a
monia gas mixtures is facilitated by contact with va
ous metallic surfaces, such as those of platinum, copp
etc."

The following three replies came from professors
chemistry in prominent universities:

"Mixtures of ammonia and air are inflammable
the same way that mixtures of gasoline and air are
flammable, although not to the same extent. Pure a
monia is inflammable as well as that which may be co
taminated with oil vapors."

"One of my assistants tells me that while taking
course in ——— college, the professor there used
burn ammonia in an ordinary burner similar to tho
used on gas stoves. He would first warm the burner
using illuminating gas in the usual manner. Then
would switch to a current of ammonia gas, which cou
then be burned readily. I have never seen this expe
ment tried myself, however. It is possible that in th
experiment the iron and iron oxide of the burner m
have a catalytic influence in accelerating the oxidati
of the ammonia."

"I have seen a lecture table experiment, in whi
ammonia was used as the second element of a high te
perature blast, which seemed to be a flame fully as h
as that of the oxy-gas blast."

"It seems hardly probable that concentration cou
be obtained in the normal operation of the refrigerati
apparatus which would permit ammonia to burn. T
would seem, however, to be a matter for careful expe
ment rather than "belief," and I do not wish you
place any unusual confidence in my personal opinion
the matter."

The exact meaning of the following, by a promin
chemist, is not perfectly clear to the writer:

"I believe it is safe to state that under suitable c
ditions ammonia can be considered inflammable. Y
understand, of course, that the word 'inflammable' d
not limit the reaction to oxygen combustion."

A large manufacturer of ammonia wrote:

"Ammonia is feebly combustible in atmospheric
and may be seen by holding a taper just within
mouth of an inverted bottle of gas which burns wit
peculiar kind of flickering light around the flame,
will not continue to burn when the flame is removed.

My Own Conclusion.

After carefully studying the above letters, my rep
to my client was that pure anhydrous ammonia carb
burned UNDER COMPULSION in the presence of in
Its combustibility need not be feared, however, un
it is mixed with oils, greases, or some gas that is kn
to be combustible.

And now, Mr. Dairyman, what do YOU think?
you going to be afraid of ammonia hereafter? I'm

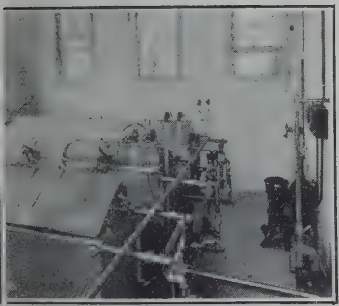
Getting Deep Cream Lines Low Bacteria Counts and Fine Flavor



In the Norwalk Dairy, Norwalk, Conn.

In the Earl E. Blain Dairy, Cleveland, Ohio

Here are some of the plants that are consistently getting deep cream lines, low bacteria counts and fine flavor in their milk. And there's a reason—they are using Burrell-Simplex Spray Pasteurizers.

And why are deep cream lines, low bacteria counts and fine flavor in the milk so consistently obtained with Burrell-Simplex Spray Pasteurizers?

(1) The *Deep Cream Lines* are made possible by the use of *low temperature heating water* and *gentle agitation* in the Burrell. (2) The *Low Bacteria Counts* are secured, first, because of the absence of stuffing boxes or bearings inside the vat, and, second, because the smooth, flat interior surfaces may be easily and thoroughly cleaned. (3) The *Fine Flavor* results from adhering to the latest accepted principles of pasteurization, namely, the combination of low temperature heating water, gentle agitation and simple, sanitary construction.

The use of *low temperature* heating water in theBurrell is made possible, first, because the milk comes into contact with a larger heating surface —25% to 50% greater—than in any other batch pasteurizer; and, second, because the heating water, sprayed against the vat lining, flattens into a rapidly-flowing film and transmits heat to the milk with great efficiency.

The *gentle agitation* in the Burrell is effected by wide, flat paddles which swing to and fro with a long, slow, sweeping movement. This forces every particle of the milk across the *broad heating surfaces* of the lining. Yet, the motion of these paddles is so slow and gentle that no churning action or violent agitation results.

The *simple, sanitary construction* of the Burrell facilitates absolute sanitation. The plain, jacketed milk vat is completely free from all bearings, gears, stuffing boxes and other obstructions. There is nothing below the milk line except *broad, flat, smooth, easy-to-clean* surfaces.

Illustrated catalog, fully describing the Burrell-Simplex Spray Pasteurizer will be sent gladly upon request.

Prof. Burke's Inquiry -:- Department -:-

Correspondence Covering a Variety of Sub- jects of Interest to Milk Distributors

Dear Sir:—Will you please advise me if there are any books on the market in regard to vitamines? Would like to know why they are essential to health, and what effect lack of certain vitamines would have upon the health, and in fact all the information I can get in regard to them.

Reply: A vitamine is defined as a dietary essential. It is a constituent of certain foods which have been found to be essential to health, growth and well-being. There are three vitamines in which we are especially interested.

Vitamine A is found primarily in butterfat, cod liver oil, eggs and the vital organs of animals. This vitamine is growth-promoting, and its deficiency in the diet produces certain eye diseases and general malnutrition. Vitamine B is found chiefly in leafy vegetables and fruits. It also occurs in milk, cheese, yeast, etc. It, like vitamine A, is necessary for growth, but it appears to prevent neuritis and other certain diseases, such as beriberi. The third vitamine, known as vitamine C, is found chiefly in vegetables and in fruit juices. It is readily destroyed by heating, and for that reason may be deficient in pasteurized milk. It is the vitamine which prevents scurvy. There are, at present, two other vitamines which are sometimes listed. Vitamine D being claimed to prevent rickets, and vitamine E necessary for reproduction. However, the latter two appear to be the subject of much discussion and controversy at the present time.

You ask regarding publications on the subject of vitamines. You will find these discussed quite thoroughly in the following texts: "The Vitamines," by Funk; published by the Williams & Wilkins Co., Baltimore, Md.; "The Vitamines," by Sherman & Smith, Chemical Catalog Co., 1 Madison Ave., New York City; "The Newer Knowledge of Nutrition," by McCollum, published by the MacMillan Co., New York City.

Any of these publications should give you full information regarding vitamines up to the time they are printed. You must remember, however, that a great volume of material is published in magazines regarding this subject, as it is of great interest. Therefore, what is accepted as a fact today may be altered tomorrow.

* * *

Dear Sir:—Am going to make ice cream on a small scale. I have got just an ice cream freezer. I will harden my cream with ice and salt. Will have an ice box four by twenty feet for hardening. I have an improved starter can pasteurizer.

Can I keep milk and cream from morning until night before pasteurizing, or will I have to pasteurize twice a day? Will I have very good success pasteurizing without homogenizing? I want to make good cream.

Will the ice box I spoke of, insulated with six inches of cork, three thicknesses of lumber and one of tar paper, made air-tight, do for hardening, and will it keep ice fairly well?

Reply: In answer to the questions regarding the manufacture of ice cream and pasteurization of milk, I beg to state that you can keep both milk and cream from morning until night and then pasteurize, providing the products are cooled very promptly to below 50 degre F. and held at that temperature until they are dumpe in the vat for pasteurization. However, I believe yo would find it more satisfactory to hold the night's mil until morning and pasteurize as the nights are muc cooler than the days, and there is no great difficulty i keeping the product cool. If you find that the milk ca not be handled in this way, it will, of course, be nece sary for you to take the matter up with the dairyme and get them to produce a very sanitary product whic will keep the required period. Otherwise you will hav to pasteurize twice daily. This should not be necessa if the milk is sanitary and kept cold.

I note that you are not planning on homogenizin your mix. This being true, it will be very necessary tha the mix be cooled to at least 40 degrees F., preferabl lower, before you put it in the freezer, otherwise it ma churn. You should be able to make a very good produc for home use and small trade if you are careful wit your manufacturing process and the ingredients whic you use.

The ice box whch you speak of should be satisfactor as a hardening box. I have used similar apparatus i making ice cream and, while utilizing a considerab amount of ice and necessitating extra work, it did ser the purpose for which it was intended.

In pasteurizing your milk, cream or the ice crea mix in the starter can you must be careful to preve steam from striking the heating surface directly. Othe wise, casein will bake on the sides and form a socall "milk stone," which is rather difficult to remove a forms a good insulating coating over the interior of t vat. There is also the possibility that steam striking t heating surface will give the product a slightly cooke flavor. However, if you are careful I believe these di- culties can be avoided and you should obtain satisfa- tory results with the process.

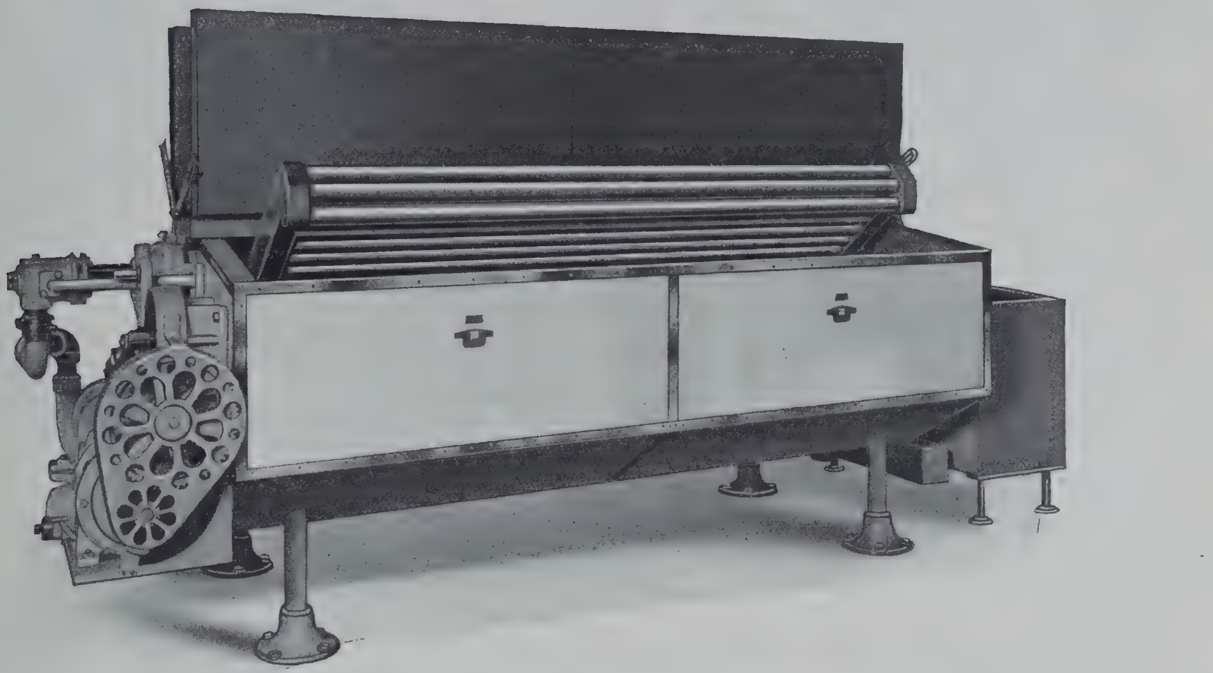
Reply to J. W. B.: Your letter relative to difficulty with milk churning has just been received; also the sample of milk. The milk was sour upon its arrival and I was unable to make a thorough test of the sample.

Perhaps your difficulty is traceable directly to the length of time the cow has been giving milk. Cows which have been milked for long periods and are near the end of their lactation period produce milk which is frequently very difficult to churn and occasionally fails entirely to make butter. If this is the difficulty it will be readily overcome when the cow again freshens.

Still another cause might be that the milk contains bacteria which cause it to curdle without souring. This would be true if cows were permitted to wade through contaminated water. The bacteria would get on their hide and later on might fall off into the milk pail, thus contaminating the milk. Thorough steaming of utensils used in hauling the milk and preventing cows from wading in infected water would tend to overcome the difficulty.

A third possible cause would be feeding the cow too much cottonseed meal or feeds which make a hard but-

"AMERICO" THE PASTEURIZER WITH A PURPOSE



The new "AMERICO" with improved coil control and new flush outlet valve

RECENT "*AMERICO*" INSTALLATIONS

In the purchase of an "AMERICO" pasteurizer, you not only get the value of a well constructed machine but through its improved principles of operation, the "AMERICO" places a greater value on the product it turns out.

Its mild agitation, the use of low temperature heating medium, no stuffing boxes nor bearings in the batch, its flush type outlet valve and the assurance of thorough cleaning made possible by the feature of raising the coils out of the vat are accountable for the wonderful results being obtained with the "AMERICO" Pasteurizer.

Users boast of their cream line and flavor.

terfat. In this case the butter might fail to come or if it did churn, would be especially hard and difficult to make hold together. In this latter case it would be necessary for you to feed the cows some succulent feeds such as beets or good green alfalfa hay. I am inclined to believe, however, that the difficulty is probably caused by the first factor which I mentioned.

* * *

Dear Sir:—I live on a farm and milk two cows. They are fat, have wild pasture and Turkey Creek runs through the pasture. They have tank water pumped from the well every day. Their milk looks all right when drawn from the cows but when separated, the cream is ropy. We can't understand what could be the reason for the ropiness.

Reply: Ropy milk and cream is a common trouble which occurs frequently on different farms and in some milk plants. The ropiness is caused by bacteria which get into the milk and in some cases enables the milk and cream to be drawn out in long threads. The bacteria appears to frequent water and I am led to believe this is what is causing your trouble. If the cows get the water on their hides and it dries it is very easy to brush any small particles of dust from their hides into the milk pail which would, of course, infect the milk. I suspect the cows wading through Turkey Creek have gotten the bacteria on them.

I suggest you whitewash the barn and prevent the cows from wading in the water. While one type of bacteria which usually produces ropiness is harmless, they are rather difficult to get rid of once they get started in a certain location and, of course, milk which is ropy is discriminated against.

The fact that the cream on your milk gets ropy quicker than the milk itself is because as the cream rises it tends to carry with it some of the bacteria in the milk. Therefore, it is more heavily laden with the ropy organisms than the milk. I would suggest the following to enable you to overcome the difficulty:

1. Prevent the cows from wading in Turkey Creek or any stagnant pools.
2. Whitewash the interior of the barn and scatter lime about.
3. All manure piles should be hauled to the field and lime scattered about.
4. Sterilize all utensils with live steam or boiling water.

* * *

Dear Sir:—Please give us some information on the American association test to determine the loss of fat in the buttermilk, as I read in one of your replies in the June issue of The Milk Dealer that it is a better method than the sulphuric acid one.

Reply: The American association test for fat in buttermilk consists in using normal butyl alcohol in addition to sulphuric acid for liberating the fat from buttermilk. The results obtained are considerably higher than those of the regular Babcock method and are considered much more accurate.

The equipment you will need for running the test is as follows:

1. The ordinary skim milk test bottles, preferably reading ½% (50/100%).
2. A 9 c.c. pipette.
3. Normal butyl alcohol. About one-half pint should suffice for approximately 120 tests. (You should be able to obtain this from any chemical supply house).

In operating the test, proceed as follows and add the reagents in the following order:

1. Transfer 2 c.c. of the normal butyl alcohol to a skim milk test bottle.
2. Add 9 c.c. of buttermilk and mix thoroughly.
3. Add 7 to 9 c.c. of sulphuric acid, a few cubic centimeters at a time, and mix thoroughly.
4. Centrifuge 6 minutes and fill the test bottle to the base of the neck with hot water.
5. Centrifuge 2 minutes and fill the large bottle neck with water which serves to bring the fat into the small neck.
6. Centrifuge again for 2 minutes.
7. Remove from the tester and place the bottles in a water bath heated to 130 to 140 degrees F. for 5 minutes. Read as for milk and multiply the reading by 2.

This test conforms closely to the chemical extraction methods.

* * *

Dear Sir:—We are operating a small dairy here in a town of about 5,000, selling pasteurized and clarified milk and are having trouble during summer months in determining whether the milk is sweet or sour. I have tried different tests but never had very much success with any of them.

I was employed for nearly two years at a large dairy as engineer's helper and at this plant they used a pink liquid in the receiving room. They took a small portion (a few c.c.) of milk in a cup then added the same amount of this pink solution, stirred the two together and if the milk turned pink it was sweet and if it remained white, it was sour.

This solution was never used after it was over 30 days old. I have tried different places to get this testing solution or the formula to have it made, but have never been able to get it. I would be very glad to get any information on the testing solution.

Reply: The pink solution which you refer to as being desirable for determining acidity in milk is undoubtedly prepared from Farrington's alkali tablets. These tablets can be purchased from practically any dairy supply house in small boxes of a thousand. From them a solution of alkali of any strength for determining the acidity of milk can be made up.

The solution to which you refer is made up in any quantity desired by dissolving two tablets in each ounce of water. The solution thus made up will show whether or not milk contains more or less than .2 per cent acidity, if equal parts of the milk and solution are mixed together in a white cup. If the milk contains above .2 per cent acid it remains white. If it shows less than .2 per cent it remains pink.

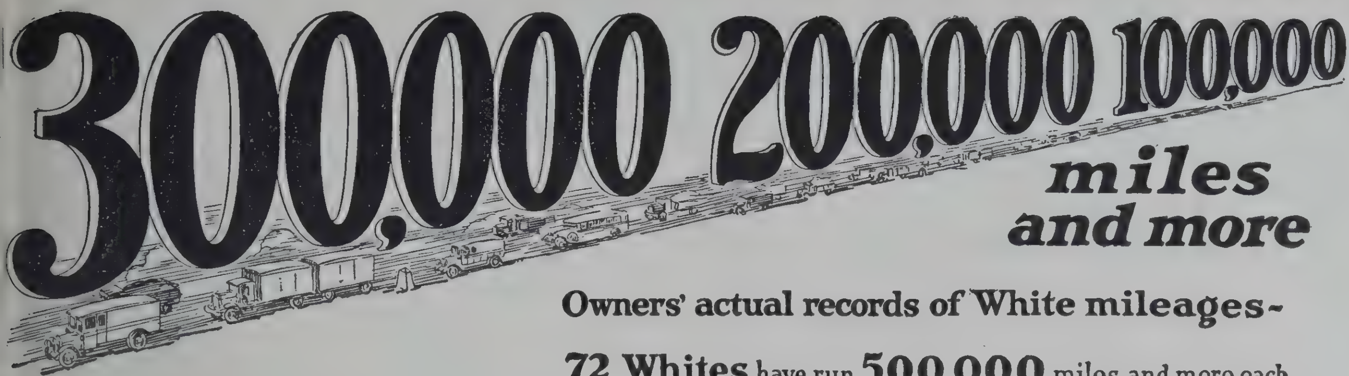
Full directions for the preparation of this solution or a solution of any desired strength are given in the folder which accompanies each box of tablets or you can find directions in practically any dairy analysis book published within the last ten years.

NORTON JOINS BORDEN COMPANY.

M. J. Norton, vice-president and general manager of the Carnation Milk Products Co., at Oconomowoc, Wis. has severed his connection with that company and has joined the Borden company of New York in the capacity of vice-president. Mr. Norton has been with the Carnation company since 1906.

He began his career on the Pacific Coast and when Carnation plans began to develop here in the middle west he was sent East as manager of the Eastern plants.

When the Oconomowoc plant was built, the Eastern offices were moved there from Berlin, Wis., and later it was largely through the influence of Mr. Norton tha the general offices of the company were brought to Oconomowoc from Chicago.



Owners' actual records of White mileages~

72 Whites have run **500,000** miles and more each

384 have run between **300,000** and **500,000** miles each

951 have run between **200,000** and **300,000** miles each

1658 have run between **150,000** and **200,000** miles each

4959 have run between **100,000** and **150,000** miles each

giving the astounding total~

8024 Whites have run **100,000** miles and more each

No owner will operate a truck or bus long enough to run 100,000 miles, unless those miles are *money-earning miles*

100,000 miles—White miles—mean more than an exceptionally long distance; more than an exceedingly durable, well-built, well-serviced motor truck or bus.

They mean unusual profits. They mean net earnings—in excess of all costs. They mean continued earnings long after the original cost has been written off the books.

200,000 miles mean all that—doubled. 300,000 miles mean all that—trebled. So on . . . . Picture the earnings of the scores of Whites that have exceeded 500,000 miles. Then picture what these mileages would mean in your own business, knowing your average mileages for a week or a month or a year.

White 100,000-mile records are not isolated performances, not special achievements under especially favorable conditions. Whites, by the thousand, exceed 100,000 miles with a regularity that makes it standard performance. . . . . All models do it. They do it in all lines of business. They do it everywhere, under all conditions of load, road, weather and climate. They do it in fleets and in single installations.

More than 8,000 Whites have run 100,000 miles and more. More than 1,400 have run 200,000 miles or more. More than 400 have exceeded 300,000 miles. The original cost of most of these 8,024 Whites has been written off the owners' books. . . . . And these mileages are actual owners' figures. They do not include many hundreds of additional Whites that have passed 100,000 miles, but whose owners have not sent us accurate records. Neither do they mirror the splendid earning records of thousands of Whites that have been serving dependably for ten, twelve, fourteen years, carrying their pay loads, without reaching the 100,000-mile mark.

This record, published annually, stands alone. No other truck manufacturer has ever published such a volume of evidence of dependability, long life and continuous earning power. No other truck manufacturer can.

THE WHITE COMPANY, CLEVELAND

Our new "300,000 Miles and More" booklet is just out, with the names of all the owners and the number of Whites each owns in each mileage classification. You will find leaders in all industries, firms in your own line of business, your neighbors, your business associates. We will gladly send the booklet free. Write for it.

Before you buy a truck or a bus see the Whites at any of our 75 factory branches or 500 dealers. There is a White model to meet every transportation need.

Truck Chassis

METHODS OF PROCESSING CHOCOLATED MILK.

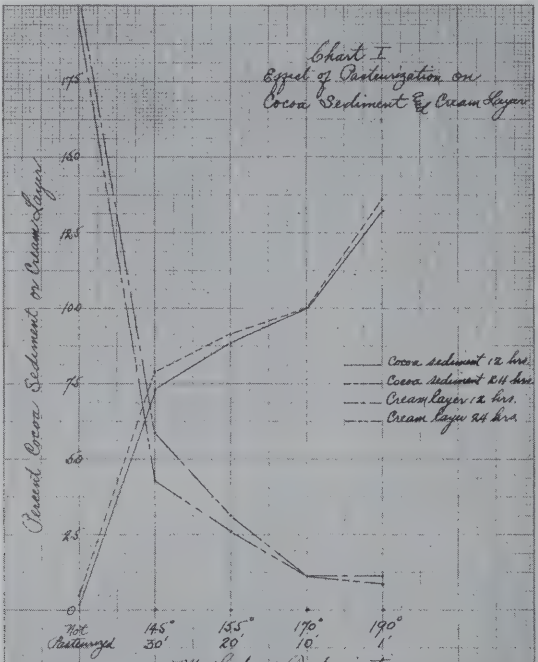
(Continued from page 36)

creased slightly the cream layer. It might be said at this point that the cream layer is dark in color, due to fine particles of cocoa carried up with the fat. In samples where the ability of the fat to rise was destroyed by heat, the cocoa that otherwise would have been absorbed into the cream layer was found in the increased amount of sediment. At the higher temperatures the cream layer was light and appeared more on the order of a cream plug.

Table I—Effect of Pasteurization on Sediment and Cream Layer.

Trial	12 Hrs. at 50° F. Cocoa sediment per cent	12 Hrs. at 50° F. Cream Layer per cent	24 Hrs. at 50° F. Cocoa sediment per cent	24 Hrs. at 50° F. Cream Layer per cent
Sample I raw	0	20	.5	18
Sample I 145°—30′	7	5	8	4
Sample I 155°—20′	8	5	8	3
Sample I 170°—10′	8.5	1.5	8.5	1
Sample I 190°— 1′	12	1	13	1
Sample II raw	1	24	1	22
Sample II 145°—30′	8.5	5.5	8.5	4
Sample II 155°—20′	10	2.5	10.5	3
Sample II 170°—10′	11.5	1	11	1
Sample II 190°— 1′	15	1.5	15	1
Sample III raw	0	17.5	.5	17
Sample III 145°—30′	6	7	7	5
Sample III 155°—20′	8.5	2	9	2
Sample III 170°—10′	10	1	10.5	1.5
Sample III 190°— 1′	13	1	13	1

To show more clearly the effects of heat on the cream layer and on the amount of cocoa sediment the data in Table I has been illustrated by use of Chart I. In making the curves the data for samples I, II and III were averaged so that but one curve is shown for each set of conditions, but this illustrates very well the general effect.



Single Stage Homogenization.

The three brands of cocoa used in the studies on pasteurization temperature were used in the following work dealing with the effects of homogenization on cocoa sediment and cream layer. In making the studies the samples were first pasteurized at 145 degrees F. for 30 minutes and then homogenized at various pressures. The results of these trials are shown in Table II. As the pressure of homogenization increasd the amount of sediment increased, but in all of the homogenized sa
ples, regardless of the pressure used, the cream layer w
entirely destroyed.

Sample number III, in Table II at 4,000 poun
showed no sediment, due to the fact that the high pr
sure partially coagulated some of the milk protei
which were evidently less stable than usual. The cu
was not granular but very smooth and the chocolate mi
was very viscous. In this case the sediment was ov
come but the product was judged of inferior quality d
to the thickness. The product was not satisfying as
drink, it did not satisfy a thirst and left a thick, fuz
taste in the mouth. It will be noticed that the sedime
deposited in 12 hours at low pressures is less in volu
than that at 24 hours; while at high pressures the
verse is true. At high pressures a very floccular con
tion in the cocoa is produced, which causes it to settle
a loose condition. This loose mass of sediment gradua
contracts and mats together on standing, thus decreasi
the volume faster than additional cocoa particles settli
tend to increase it.

Table II—The Effect of Single Stage Homogenization on Cre Layer and Cocoa Sediment.

Sample and pressure used	24 Hrs. at 50° F. Cocoa sediment per cent	24 Hrs. at 50° F. Cream Layer per cent	12 Hrs. at 50° Cocoa sediment per cent	12 Hrs. at 50° Crear Laye per ce

* This sample partially coagulated making a very visc
smooth product which was so thick that the cocoa was hel
suspension almost in total.

Two Stage Homogenization.

Samples were made up as in the previous study, is
teurized and homogenized — using two homogeni
valves instead of one, the two being set at various p
sures. One run was made, using one valve at 10
pounds for comparison. The results shown in Table I
and Chart II indicate that the use of two valves ins
of one tends to reduce the amount of sediment some
where the first valve is set at the same pressure as
in single stage homogenization. Furthermore, the
ment is more compact and darker in color than with
valve; just as the sediment deposited in homogen
chocolate milk is more compact and darker than tha
posited in chocolate milk that has not been homogen
It will be noticed that the maximum pressure rea
(the highest valve) seems to have more influence o

SANITARY·FARM·DAIRIES
Sanitary FARM DAIRIES
REFRIGERATOR MILK SERVICE
Sanitary FARM DAIRIES

This modern Refrigerator unit of the Sanitary Farm Dairies, St. Paul, Minnesota, consists of a tractor-truck and a Fruehauf Semi-Trailer. Truck and Trailer are detachable and interchangeable with other hauling units.

Trailers Will Earn Huge Profits For You

ASK any Milk Dealer who uses Fruehauf Trailers and he will tell you that a Trailer is one of the most profitable investments he has ever made in the Milk business. He can give you figures to back up his statement. He can show you how *three times the load can be carried at half the cost* of old-fashioned methods!

And, if you could inspect the fleets of Milk Dealers throughout the country, you would find that many have standardized on Fruehauf Trailers to bring about low-cost transportation. They have found that the simplicity of Fruehauf design and the ruggedness of Fruehauf construction insure 7-days-a-week service year in and year out.

Fruehauf Trailers increase the productive capacity of the motor truck two and even three times. Heavy Refrigerator bodies that carry tremendous loads can be handled easily by a moderately sized truck. Thermos tanks are also used with equal advantage.

If so many other Milk Dealers are using Fruehaufs with marked success, isn't it logical to believe that you can use them, also, and gain the same advantages? Our Engineering staff is always ready to analyze your hauling requirements, without obligation, and help you find the most efficient solution.

Pioneer Builders of Semi-Trailers, Four-Wheel Trailers and Adjustable Pole Trailers.

liquid had a smoother appearance, a somewhat lighter color and was more uniform in all respects.

A curve showing the effects of two stage homogenization at various pressures has been superimposed in Chart II for comparison with single stage homogenization.

Table III—Effect of Two Stage Homogenization on Cocoa Sediment.

Pressure	Per cent Cocoa sediment 12 hrs. at 50° F.		
	Sample I	Sample II	Sample III
No. pressure	8.5	6	8
1 valve 1000 lbs.	3	2	2.5
2 valves 1000 and 500 lbs.	1	1.5	1
2 valves 2000 and 500 lbs.	2	2	2
2 valves 3000 and 500 lbs.	3	3.5	2.5
2 valves 2000 and 1000 lbs.	3	2	2
2 valves 3000 and 1000 lbs.	4	3.5	3
2 valves 3000 and 2000 lbs.	4	5	3.5

Effect of Homogenizing the Milk Only.

In the previous trials homogenization very materially increased the cocoa sediment deposited as the pressure was raised. It was thought advisable to observe the effect when the milk was homogenized separately and the chocolate syrup added subsequently. Accordingly, the three chocolate syrups were made up with milk which had been heated to 110 deprees F. and homogenized at various pressures. The mixtures were then pasteurized at 145 degrees F. for 30 minutes, cooled and samples placed in cylinders for observation. Comparisons were made with mixtures from the same milk unhomogenized. The results of these trials are given in Table IV and a curve of the average results put in Chart II for a general comparison with the other homogenizing studies.

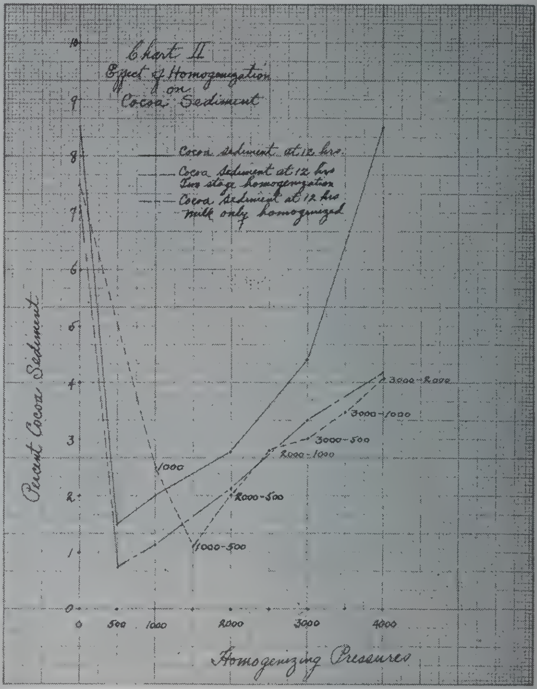
From the data it is seen that, even with the flavoring material absent at the time of homogenizing, the cocoa sediment appreciably increases with an increase of pressure used. From the chart, however, some improvement in the amount of sediment deposited is noted, compared to the results obtained in homogenizing the product with the flavor. The degree of improvement is so little that it would not seem worth the extra work involved in this method of processing.

Table IV—Effect of Homogenizing Milk Only on Cream Layer and Cocoa Sediment.

Description		12 hrs. at 50° F. Per cent cocoa sediment	Per cent cream layer
Sample I	Milk unhomogenized	6	3
	Milk homogenized 500 lbs.	.5	0
	Milk homogenized 1000 lbs.	1.5	0
	Milk homogenized 2000 lbs.	2.5	0
	Milk homogenized 3000 lbs.	3.5	0
	Milk homogenized 4000 lbs.	4	0
Sample II	Milk unhomogenized	7.5	2
	Milk homogenized 500 lbs.	.5	0
	Milk homogenized 1000 lbs.	1	0
	Milk homogenized 2000 lbs.	2.5	0
	Milk homogenized 3000 lbs.	3.5	0
	Milk homogenized 4000 lbs.	3.5	0
Sample III	Milk unhomogenized	8	5.5
	Milk homogenized 500 lbs.	1	0
	Milk homogenized 1000 lbs.	1	0
	Milk homogenized 2000 lbs.	1.5	0
	Milk homogenized 3000 lbs.	3	0
	Milk homogenized 4000 lbs.	5	0

Temperature of Homogenization.

The temperature at which homogenization is carried out was investigated. The three samples of chocolate milk were prepared using a greater amount of syrup than usual, and pasteurized at 145 degrees F. for 30 minutes, after which they were homogenized at 500 pounds pressure at the following temperatures: 145 degrees F., 85 degrees F., and 55 degrees F. Results were averaged and are shown in Table V. The results do not show enough difference to indicate any distinct advantage for any particular temperature, although the lower temperatures may give a slight improvement in the amount of sediment forming. These results cannot be directly compared with the others because of the greater amount of chocolate used in the samples.



Effect of Temperature of Homogenization.

Temperature at which homogenized at 500 lbs. pressure	Per cent cocoa sediment 6 hrs. at 50° F.		
	Sample I	Sample II	Sample III
145°F.	6	6.5	6
115°F.	6.5	5.5	5.5
85°F.	6	6	4
55°F.	4.5	5	4

The accompanying photograph shows visually th effects produced on chocolate milk by various temperatures of pasteurization and various pressures used i homogenization. The unprocessed sample (No. 1) contains the least amount of cocoa sediment but has a ver deep dark colored cream layer. The samples which wer pasteurized (Nos. 2 and 5) contain the largest amoun of cocoa sediment and still have a slight cream layer, no very noticeable in No. 5 because the higher heat seem to prevent the cocoa from being absorbed by the cream The samples homogenized at low pressures (Nos. 3 and 6 do not show any great superiority over those homogenized at higher pressures (Nos. 4 and 7) in this serie Usually the difference in cocoa sediment is more notic able. These four samples, however, present a far bette appearance than Nos. 1, 2 and 5, which were not homogenized. Comparing samples 2 and 5 it is seen tha the use of higher heats than 145 degrees F. for pasteu ization gradually reduces the dark colored cream laye

Tubes of Chocolate Milk Processed in Various Ways after Holding for 12 Hours at 50 F.*

Tube 1—Raw chocolate milk unhomogenized.
Tube 2—Pasteurized (145°—30 min.) chocolate milk unhomogenized.
Tube 3—Pasteurized as No. 2 and homogenized at 500 pounds.

THERMOMETERS

For platform inspection of cold milk, testing in holding tanks, cream ripeners, storage tanks, coolers, and for insulated wall pasteurizers, and coil vat pasteurizers.

In handling milk at the receiving platform and in the various processes through which it passes, it is often important to check the temperature. The handled industrial thermometer illustrated on the right is for that purpose.

On vat pasteurizers having a small hole in the top of the apparatus, the stem handled thermometer shown on the left is extensively used in many of the milk plants of the country.

Tycos Stem Handled Pasteurizer Thermometer

This type of thermometer has an adjustable handle and flange below the scale case. The advantage of this arrangement is that the flange and handle can be moved up or down the stem and be carried in any desired position by means of a set screw, thereby making it possible to adjust the stem lengths to meet the requirements of various applications.

Tycos Handled Cold Milk Inspector's Thermometer

This type of thermometer was designed for, and for years has had extensive use on applications of this kind. The stem is of sanitary construction and of ample length to permit immersing the bulb the proper depth in the milk to give average temperature indication. The scale is protected by a glass front to keep it clean, thus insuring accurate, quick reading. The handle at the top makes it convenient for use and the ring in the top of the handle is for hanging when out of service. This instrument has open reading temperature scale and magnifying glass tube, making it easy to locate the top of the mercury column.

and increases the amount of cocoa sediment settling, even though there is still present a tough skin-like cream layer, light in color and very shallow.

Clarification.

Chocolate milk may be clarified in order to remove the sediment but a large proportion of the flavor is also removed, and so much sediment is deposited in the clarifier bowl that the efficiency of clarification is impaired after only a short run. The first milk through contains much less sediment than the later portions. Clarification, however, is not practical because of the waste of flavoring material. In Table VI is given the results of one trial with the clarifier.

Table VI.—Effects of Clarification.

	% Sediment		% Cream Layer		Color
	3 hrs.	24 hrs.	3 hrs.	24 hrs.	
1. Unclarified	5.5	5	none	4	dark
2. Clarified	.5	1	none	2	medium
3. Clarified and homogenized at 500 lbs.	0	.5	none	none	light

The percentage of sediment was very small in the clarified samples, so small that in milk bottles none could be noticed looking at the bottle from the side.

Gelatine.

The use of gelatine was tried, both in the chocolate syrup and by adding to the mixture before and after homogenization, but no measureable improvement in the amount of sediment was apparent until the amount used was great enough to cause an objectionable thickening of the drink. It is, therefore, assumed that these protective colloids are of little benefit. The size of the cocoa particles composing the sediment is outside the colloidal realm and stabilization is probably not to be had by additions of the so-called protective colloids.

Method of Preparing Syrup.

Several methods of preparing the chocolate syrup were tried, such as boiling the cocoa in water for a considerable time before the addition of sugar and homogenizing the chocolate syrup before adding to the milk. The results regarding cocoa sediment, however, were practically invariable.

Some differences were noted when the formula used for the syrup was altered by substituting fluid skim milk and condensed skim milk for the water. This, of course, increased somewhat the amount of milk solids in the chocolate milk; and, in the main, less sediment occurred in the tubes made from these syrups than in the tubes made from the usual syrup. It is rather difficult to reconcile these results with those obtained using gelatine as a stabilizer and no attempt is made to do so. The data has been averaged and plotted in curves illustrated in Chart III. Chart IV shows the same samples of chocolate milk, but illustrates the effect of these factors on the cream layer.

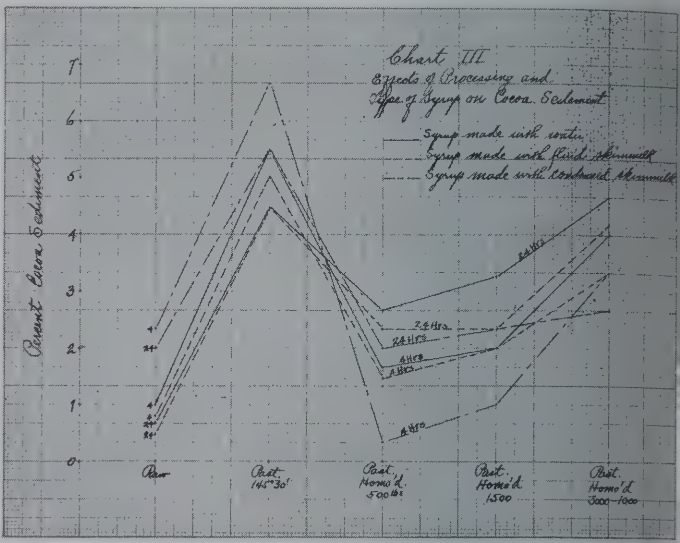
Charts III and IV are rather interesting from a number of standpoints, and, in a way, summarize in diagramatic form the results of all the experimental work covered by this paper.

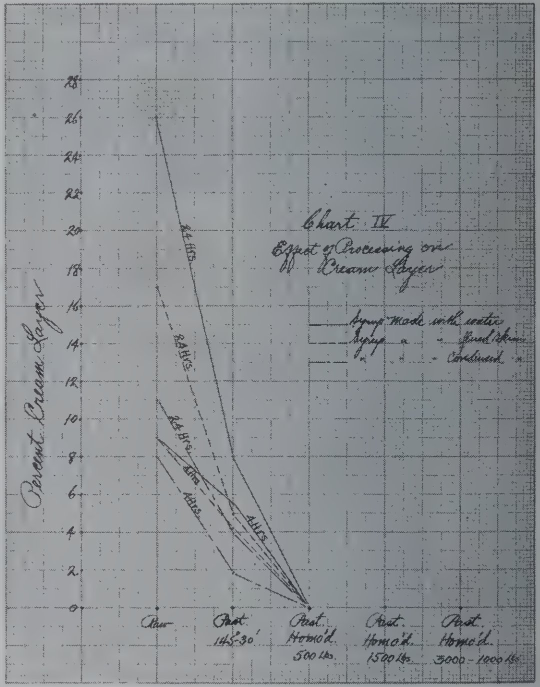
Summary.

Whole milk produces a chocolate milk with a better flavor and "body" than does skim milk or partially skimmed milk.

Different brands of cocoa give somewhat different flavors, but none perhaps can be said to have a bette flavor than another since personal preference varies.

Chocolate milk in the raw state unprocessed has a deep, dark colored cream layer after standing, althoug it shows very little cocoa sediment in most instances.





After pasteurization the cream layer diminishes ve greatly, but the cocoa sediment increases markedly amount. As the temperature of pasteurization is i creased the cream layer becomes less and less pronounc until, at 170 degrees F. and above, only a skin is form but the amount of cocoa sediment increases with the ri in temperature.

Homogenization of pasteurized chocolate milk at l pressure (500 pounds) destroys entirely any cream lay and causes a great reduction in the sediment. In so cases the amount of cocoa sediment is even less than shown by the raw unprocessed chocolate milk. Th

seems especially true where the syrup is made w skimmed milk or condensed skimmed milk in place water.

As the pressure used in homogenization is increa the amount of cocoa sediment increases. This increas shown very pronouncedly at pressure in excess of 3, pounds.

Homogenization, using two valves, gives less sedim than where only one valve is used at a pressure equa the first valve of the two-stage method.

Homogenization of the milk separately before the dition of the chocolate syrup improves the sediment c dition, as compared with homogenization after mixi

Temperatures between 145 degrees F. and 55 degr F., at which homogenization is carried out, have little no effect on cocoa sediment.

Clarification of the chocolate milk is not a satis tory method of reducing the amount of cocoa sedim

The use of gelatine is not of any advantage in impr ing the quality or appearance of chocolate milk.

The use of skim milk or plain condensed skim m as a substitute for water in preparing the chocolate sy is of advantage, since in most cases the product a processing will show less cocoa sediment. This, howe does not hold true unless the product is homogenized

Conclusions.

From the trials made and the data recorded the lowing conclusions seem warranted:

1. Whole milk should be used as a base for chocol milk where possible or practicable.
2. The mixture should be pasteurized, and wh homogenization is not possible a high heat should used, possibly 155 to 160 degrees F. for 15 minutes overcome the unsightly cream layer.
3. The product should be homogenized where po ble at a pressure not exceeding 1,000 pounds.
4. If the manufacturer prepares his own choco syrup he should use a good grade of Dutch process co and should use condensed skim milk or fluid skim m in place of water in the syrup, except where the pro is not to be homogenized. In the latter event wat probably superior.
5. The chocolate milk should be placed in the ha of the consumer as soon after processing as possible.

(A large part of the experimental work quoted in h paper was done by L. D. Zern and H. B. Monier, student graduate student, respectively, in dairy manufactures at Pennsylvania State College.)

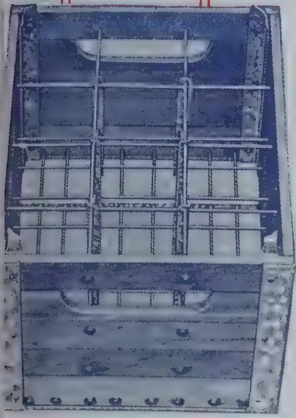
More Trips *and* Longer Wear



More trips—longer life—that's the only way you can make your case investment pay returns.

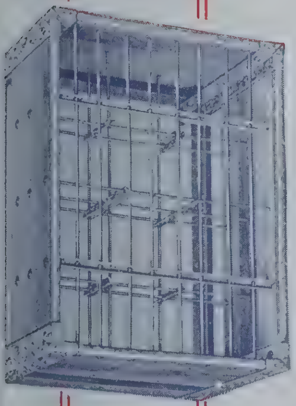
Broken, weak or wobbly cases mean delays—in the plant or on the route.

Using damaged cases to get the very last trip out of them is poor economy. Like going out on a long automobile trip with a worn, frazzled tire that is sure to "blow."

Every large milk plant continually needs new cases. Send in your order now for a dozen Armor Klad Cases. A year or two from now, you'll be more pleased than ever with your purchase. Your first dozen of Armor Klads will mean more dozens later on.

Some excellent territory is still available for reputable Jobbers

Armor Klad Bottle Cases



BUILT *for a* BATTLE OF BUMPS

Crash—bang—bump! That's what the average bottle case goes through many times daily. Armor Klad Cases are built to stand this gruelling wear. They are completely protected and re-inforced, top, sides and bottom, with heavy galvanized iron. They are made with an extra margin of strength for the hardest use and abuse. And they will give you a twenty-four hour service year in and year out. Fewer parts, securely riveted. Nothing to come loose or apart.

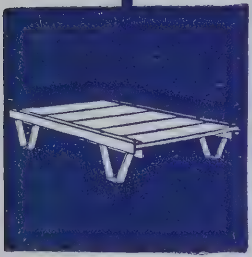
When the largest dairy in Ohio—and one of the largest in the United States—buys ten Stuebing Trucks, every Dairy and Creamery Man should be interested to find out why.

One place they save is in the cooler. Another is in the sterilizing room—still another is in handling boxed products.

There are no waste motions with the Stuebing Method—no unnecessary unpiling, loading, unloading, repiling. Material is piled on portable platforms—the truck backed beneath—the load elevated ready for trucking. At destination the load is lowered automatically and the truck is free for other platform jobs. All excess labor is eliminated. It is more satisfactory than roller conveyors because of the flexibility.

WRITE—PHONE—OR WIRE

Get in touch with us at once. Write—phone—or wire for a free demonstration. We will gladly furnish the necessary equipment for a thorough trial under your conditions, There's no obligation.



Stuebing Steel-Bound Platforms match the Stuebing Lift Truck in strength of build and adaptability of service. They won't wear down or wabble

CLEAN MILK PRODUCTION UNDER WINTER CONDITIONS.

In most parts of the country the conditions under hich milk will be produced during the coming winter onths will be different from those met with during the arm weather. During the summer months the dairy erd is in the open the greater part of the time, the arns being used only for milking and feeding, while uring the winter the cattle will spend the greater part f the time in the barn. Under these changed condiions factors not encountered during the summer will e met. These factors, such as stable conditions and ethods used in feeding, have a direct bearing upon he quality of the milk produced. The flavor and odor f the milk, as well as the health of the cattle, may be ffected by improper methods.

A thorough cleaning of the stables, together with ainting or white-washing, could be undertaken at this ime. It will be much easier and more profitable to have his done before the cattle are in the barn. Walls, ceilngs, floors, stanchions, and windows, when clean, do ore than add to the attractiveness of a stable. Under uch conditions high quality milk is more readily prouced.

Cattle should not be expected to keep in good health vhen housed in dirty, dark, and ill-ventilated stables. Iealth of cattle is dependent upon proper ventilation. itables with either too much or too little ventilation luring the winter are common. Proper ventilation and roper temperature are compatible. Many inexpensive ethods of controlling ventilation and still keeping the roper temperature are available. Farmers' Bulletin 393, Principles of Dairy-Barn Ventilation, gives direcions in this matter. Copies may be procured from the Jnited States Department of Agriculture, Washington,). C.

Under stable conditions more time and labor must e expended in keeping the cows clean than is necessary nder pasture conditions. However, clean cows are imortant if a good quality of milk is to be produced. 'his fact, although well known, cannot be emphasized oo strongly or too frequently.

Certain feeds, such as silage and roots, which are ommonly fed during the winter, may impart undesirble flavors and odors to the milk. To overcome any uch condition feeds of this kind should be fed one hour fter milking.

The proper cooling of milk is another important facor in producing milk of good quality. With the advent f cool weather many producers may have abandoned he use of ice in the belief that the air temperature is ufficiently low. A thermometer will show whether or ot they are justified in such a change. Prompt cooling f milk is important at all times.

These facts are not new, but their importance is so reat that it might be well to bring them once again o the attention of the producers before the change is nade from summer to winter conditions.—Milk Inspecion Letter, Bureau of Dairy Industry, U. S. Department f Agriculture.

BUTTER HAS PLACE IN REDUCING DIET.

In this age of starving, dieting and reducing, when sylphlike figure is the fundamental requisition of stylshness, it is good to note that a recent report of the U. 3. Department of Agriculture states that butter may ave an important place in the dietary of overweight ersons. It is pointed out that some years ago butter vas one of the things that was first taken from those vishing to reduce. Now we are first persuaded to give ıp potato, cereals and sweets.

What and Why Is a Good Milk Salesman

An Inquiry Into One of the Most Important Phases of the Milk Business

By A STAFF REPRESENTATIVE

THREE milk sales managers representing three milk companies in one of the large cities of the country recently gave me some points on selling milk that I believe will cause some new lines of thought in this industry. We know the big thing in the industry is to sell more milk. But it is astonishing how little we are doing to achieve this end, how little we are working with the salesmen.

I obtained three viewpoints.

"How many men on your route?" I asked one sales manager.

"We have —— drivers," he answered, and he doubtless was right; they were drivers and nothing else. General appearances about the plant indicated that. Not that it wasn't a nice, large institution, but there was not that order, that smooth, consistency of operation that you find around a well organized plant where people are selling milk as it should be sold. The plant complies with all regulations as to sanitation; it would get a compliment from any inspector in the city—but it isn't selling milk. That being true, as Ella Cinders would say, the other qualifications don't matter.

"We have —— men trying to sell milk," said one conscientious sales manager with a drawn, worried look on his face, and I'll say for this fellow that he was doing his best; he was trying to get something out of his men, trying hard. He had obstacles. We'll come to them later.

"We have all the salesmen we need," smilingly said the third milk sales manager, thinking the writer was looking for a job. I have more respect for his judgment if he entertained any thought that this individual was looking for that kind of employment, for I learned, after a few minutes chat with this man, that a milk salesman—a real salesman of milk—is a highly specialized professional man.

But this man, who had "all the men needed," interested me greatly. He seemed to be sure of himself, to have a pretty good idea of what it was all about. His place of business indicated that he was following a sure-footed path, and investigation showed he was.

"We have been told," he said, "that we have the best milk salesmen in the Middle West." I had heard the same thing. "We have been given much credit for training them."

That was just the point. "How did you train them?"

He shook his head. "We didn't; they trained themselves. Of course, we had certain procedures, but in the first place, young man, a real milk salesman must be born to his job—must be talented for it just as surely as an artist is talented. With that foundation, then he can make something out of himself at selling milk—but we can't do it for him. Nobody can do anything for anybody else, except keep him guided, so far as is possible, on the right track."

The Trial Horse.

At this juncture a man entered. He wore the white overalls of a milk wagon driver, and such he proved to be—just a driver. Not a salesman.

"Want another horse," he said.

Without looking up the sales manager wrote something down on a sheet of paper. "What's the matte with your horse?" he asked.

"Why," replied the other, "he's just no good- crazy as a bat. Never can handle him. Can't train hi to do anything. Don't believe anybody can train him.

The sales manager nodded, smiled and said, "I'll se what I can do, old man. Wait a bit longer." Then h carefully folded the slip of paper, put it in an envelop and wrote something on the side of it.

"That man," he said, "is just the proof I need t show you that milk salesmen are born, never mad That's the reason we don't fool with them when the are not cut out for this work. It's an injustice—an i justice to us and injustice to our men. Now, that fe low, in the next job he gets, such as plumber's assistan apprentice printer, may be a whirlwind success, an that's no reflection upon those trades; it just mear that certain men are wonderful in certain places, an 'flops' elsewhere."

"But how did you find out so quickly about the ma and his shortcomings?"

The sales manager smiled, pressed a button an leaned back. When a girl entered the office and too the envelope from his hand, one could see what he ha written. The envelope bore the words "CASHIER."

"The gentleman is checking out on payday," h said, turning back to his interviewer. "He has just ha a thorough trial on our trial horse."

"Trial horse!"

"Sure. I know it sounds funny," and he laughe "We're always laughing about so and so being a tri horse, but in this organization we have a real trial hor —a horse that isn't fit for a thing in the world but try out new men, so we can see if they have the rig sort of stuff in them."

"What—what sort of a horse is it?"

"Just the kind that fellow said it is—the crazie, balkingest horse in the world, without a bit of sen without a bit of gumption whatsoever. We figure that two weeks is long enough to punish a man with that horse. If he finishes two weeks with that horse and still comes back for more, without complaining, then we know he's good—very good. That's the only kind f men we want. Now, this fellow who just went out isn't a bad kid at all; he's just too finely drawn. We really could keep him. If we were at all shorthanded, we'd just let this boy stay on, rate him down a bit as a man who would need a lot of care and training. But we don't need men just now—so we stick to those of the very best—no more."

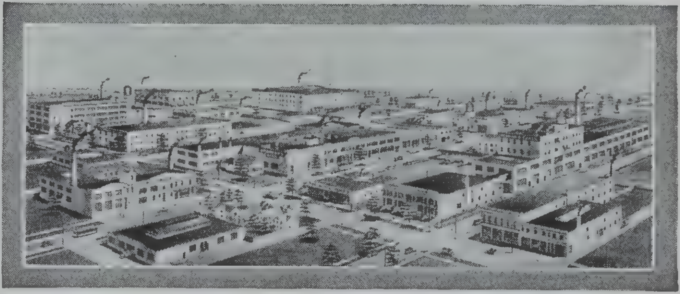
"Now this trial horse," the sales manager resumed, lighting a cigar, "is not an accident. We went out and got him. It was a scheme that I wanted to try out. We figure that real salesmanship in the milk industry calls for patience, patience—PATIENCE! There is nothing in the world that so demands patience of a man as this business. Think of the milk salesman's hours; early in the morning; that is the very hardest time of the day for any man to be sane, normal, sunny-tempered— patient. It is the very time of the day when, snatched out of a sound sleep to begin a hard day's grind, that the average man's nerves are on edge. Now, you, for instance, impress me, upon first glance, as being just ex-

The interior of this new Grennan Bakery at Cincinnati won't need repainting for years. Barreled Sunlight remains white longest, resists dirt, and washes easily

12 *fine plants in one chain* painted with Barreled Sunlight

IN sending us the photograph reproduced above, Mr. K. L. Grennan, President of Grennan Bakeries, Inc., wrote—

> "This is the 12th Grennan Bakery to be painted with Barreled Sunlight. We find that Barreled Sunlight retains its whiteness, can be washed like tile, and can be easily applied, so that it actually costs less than any other paint we have ever used.
>
> "Most favorable comments have come to us from visitors, on the clean, sanitary appearance of every building."



"Grennan Bakeries City"—a composite view showing several of the fine bakeries of the Grennan chain, prominent in the Middle West. All are painted inside with lustrous white Barreled Sunlight

MADE by the exclusive Rice Process, Barreled Sunlight is guaranteed to remain white longer than any gloss paint or enamel, domestic or foreign, applied under the same conditions—also, not to flake or scale if properly applied.

Its surface is so smooth—and so durable—that washing removes the dirt but not the paint.

It flows so easily that it can be applied by brush or spray, *at the lowest cost per square foot covered.*

And the lustrous surface of Barreled Sunlight reflects light of just the right quality, as well as quantity, for ideal working conditions.

Sold in 55- and 30-gallon churn-equipped steel drums, and in cans from ½ pint to 5 gallons. Where more than one coat is required, use Barreled Sunlight Undercoat first.

actly the type of man who could do anything—almost anything in the world perhaps—except sell milk!"

He leaned back and smiled with the assurance of one who feels that he knows what he is talking about.

"You might make good on almost any job that calls for energy, dash, impulsiveness, for you seem to have plenty of fire. But the real milk salesman must have plenty of fire and at the same time plenty of patience. He must keep his fire smothered down, must keep control, keep his gear just right, ready at any moment to change speed, slow down or speed up. Some times a man may be at a point where he must do a lot of speedy work with his hands and feet and at the same time be ready to keep down, keep quiet and deliberative while talking. That is a milk salesman's job.

"We have men in this organization who wouldn't flinch if you were to fire off a cannon under their ears—"

"Training, eh?"

Sales Manager is not a Trainer.

The other shook his head. "Why," he asked, "do all of you fellows place so much store on training? You seem to have an idea that a sales manager is a sort of trade school teacher, a man who can train a man to do almost anything. That is wrong. No sales manager can do much training—I can't, I'm sure. The best thing that I have found out about selling milk is the best training is self-training. The man on the wagon knows a great deal about what he faces; I know something of that and something of other things on the side which he doesn't see, so I can guide him along a bit. But this thing came to me while I was on a route. Just out of college. I had studied salesmanship. Had an idea that all I had to do was go to some company and get a job as assistant sales manager and work up." He smiled reminiscently. "I got a job assisting one of the milk salesman on a route, and in five years I was one of the men in the sales manager's office—just one of the boys, not even assistant to the assistant.

"But I learned something. I noticed that our sales manager was very careful to keep up with his records, his routine—and to keep everything confidential. If somebody in the front of the office said something to him, he almost would throw a fit. He would then sit down and look worried. They probably had given him a little warming up about increasing sales. But his idea of getting action was—well, not my present idea. He got cross and went over his list and balled out all of the men whose work didn't look good. Then he tried to tell them how they ought to be ashamed of themselves, how he knew they could overcome this or that objection just by doing thus and so.

"He acted as though he felt he was a parent of all his men. He showed me just exactly—how not to sell milk.

"One of the first things I did—and still do—is to let my men know that they can see me any time they want to, and that I'm always ready to listen. Notice how that boy just walked in to tell me about that horse—no one to stop him. No one to say, 'Wait and I'll see if he's busy.'

"Furthermore, I let my men use their minds. No two men in the world are exactly alike. You can't lay down a set of rules and regulations governing every man. Some of our best milk salesmen are what people in other lines of business would call 'peculiar.' Possibly that's why they are milk salesmen—this is a peculiar business—a business of peculiar habits and hours—just exactly reverse to every other line of business. They get up just when some people are fixing to go to bed, just when most people are sound asleep. They go to sleep just while some people are getting ready to com to town.

A Rule is a Means to an End.

"I have found that the best rules are no rules. Th best governed people in the world are the least governe people. My boys have a free hand. They know only th general rules—what they call in the army 'genera orders'—the set rules about their hours, general conduc and general attitude toward people. They know tha they are not tried on rules, as to whether they keep ther or break them, but upon what they do, what they sel At the end of a certain period there is no argument; th records speak for themselves. Of course, if a certai man's sales begin to fall off steadily, that's no reaso why I should fire him; the chances are that somebody—some rival company—is 'working' his route in a merchandising drive for new customers. It's my busines to watch these things. I know his records better tha the man does himself. When I see a sales record fa off without any apparent reason, then I investigate Usually I find that the boy needs help; we must brin up some reinforcements to follow along behind and sav the business we have on that route. We have a system there that's all of a story in itself. There is no secret t it, and you might as well know. Here it is:

"My sales chart tells me that Frank Jones, on rout 17, sold less milk in September than he did in Augus Well, that isn't startling, for milk sales are liable t drop off in September, particularly if it gets a bit coo But I look back and see that the percentage of declin was greater than for the preceding September, and th weather is no cooler this year. Then I take a look ove his route, through some of my 'eye' men. My 'eye' me are boys who investigate routes to see if everything go nicely. Surely enough they'll uncover that Fran Jones' route is 'spotted.' Of course, you know wha milk men mean by 'spotted'—they mean 'spotters' a out trying to take away customers.

"Well, then we lay down a barrage of our own. W concentrate a bit of sales literature on this route. W step up a bit on service, send out a lady to advise th housewife about some particular dairy dishes. She take along a little butter and cheese and donate that a certain little party in that neighborhood, while man of our regular customers and prospective customers in. Our lady gives them a nice demonstration of the new dishes, and—well, does what she can by makin these people better appreciate our service.

"But the best milk salesman is the fellow who teaches himself, the fellow who can get along with people, the fellow who can keep from getting mad. He is not necessarily without faults. He can have a wicked temper. He can be just as full of faults as anybody, but he must be a fellow who knows his shortcomings and knows how to sit down upon them—a man with a passion for selling more milk—a man who will make this the greatest aim of his life.

"That, in short, is the only kind of man we can use. If he shows the symptoms, we let him develop them—but we can't do it for him. Neither can anybody else."

⁂

BORDEN COMPANY TO ESTABLISH PLANT IN THE SOUTH.

After several months' negotiations the Bordon Milk Co. has announced that a milk plant will be located in Pulaski, Tenn. The Pulaski chamber of commerce has given every aid to the company in getting a correct census on dairy cattle in Giles county.

The Giles County Co-operative Creamery will become property of the Bordon company in the deal.

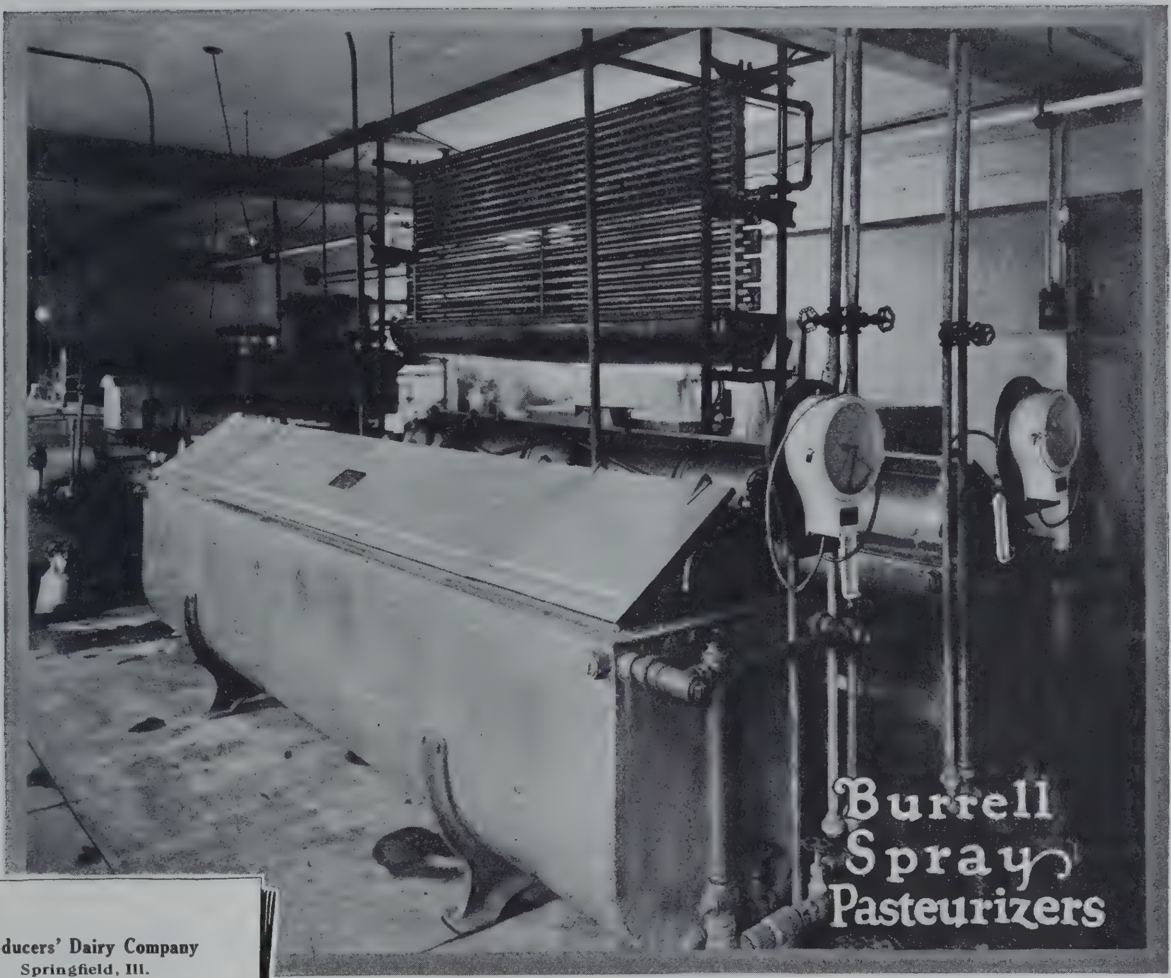
ON DAIRY PRODUCTS ALL THRIVE



Producers' Dairy Company
Springfield, Ill.

Gentlemen:

We are using three of the 300 gallon nickel lined Burrel Spray Pasteurizers and are very much pleased with the results we get from them. We feel that we can secure a better product through the spray pasteurizer and can hold a better cream line than we could over the coil type of pasteurizer.

The simplicity of the machine makes it extremely easy to clean, therefore, we save some labor in the upkeep of the machine.

Very truly yours,
PRODUCERS' DAIRY CO.

"Better Product...Better Cream Line ...Extremely Easy to Clean"

THESE facts from the experience of Producer's Dairy Company, Springfield, Illinois, pretty nearly tell the whole story about the Burrell Simplex Spray Pasteurizer. *Better Product*—because it preserves the natural uncooked flavor, due to the use of a lower temperature heating medium. *Better cream line*—because it avoids excessive agitation. *Easy to clean*—because every inch of the vat is so easily accessible.

Write for complete folder explaining the Burrell principle and the many ways in which it can save time and make money for you.

Is Your Horse Feeding Efficient?

Feed Your Horses the Skim Milk Instead of Running it Down the Drain, Thus Saving on Grain Costs

By J. A. SIMMS*

THE writer recently went through the stables of a large milk dealer who uses about 600 horses. The horses were in good flesh, the stables were clean, well lighted, excellently ventilated and entirely free from any objectionable odors. The barn and the condition in which it was kept were rightly matters of pride to the manager.

This firm can save $60,000 per year in feed bills without decreasing the efficiency of the horses by adopting as up-to-date practices in feeding horses as are used in handling milk provided the information given me concerning feeding methods was correct. The rations used are about as follows:

Timothy hay—30 pounds daily in three feeds.
White oats—16 pounds in three feeds.

Average weight of the horses is 1,550 to 1,600 pounds. Large quantities of skim milk, a valuable horse feed, are either trucked out of this city a considerable distance to be used for calf and pig raising or dumped into the sewers.

Fourteen pounds of hay is ample for horses of this weight and kind of work as proved by carefully controlled tests in this state and elsewhere. Skim milk should be used for feeding the horses instead of being turned into the sewers or carried out on farms. Probably half of the grain can be saved through substituting skim milk when a sufficient quantity of this dairy by-product is available. Corn, barley and wheat bran should be used at present prices as a substitute for oats. This mixture comprises a more nutritious ration than oats and costs less per ton. The rations being used and a good cheaper ration follow:

Present ration	and	cost per horse
Timothy hay	30 lbs.	37.5 cents
Oats	16 lbs.	28 cents
	—	—
Total	46 lbs.	65.5 cents
Cost per year per horse		$ 239.07
Cost per year for stable		$143,442.00

Suggested ration	and	cost per horse
Mixed hay	14 lbs.	15 cents
Ear corn	9 lbs.	12 cents
Crushed barley	4 lbs.	6.6 cents
Skim milk	10 qts.	3 cents
	—	—
Total	48 lbs.	36.6 cents
Cost per year per horse		$ 133.59
Cost per year for stable		$80,154.00

If the saving suggested is made in hay alone this will amount to $49,272 a year. Some feeders will object to the use of clover or alfalfa mixed with the timothy but these hays are superior to the best of timothy for the feeding of horses. Many of the finest stables of race horses in the East are fed at the present time on mixed clover and timothy hay. If the wind of the thoroughbred is not harmed by this roughage it is certain that the milk dealer' horses will not be either. Mixed hay is not only a richer feed than timothy but costs from $2 to $5 per ton less.

Even though no change is made in the kind of hay fed the use of fourteen rather than thirty pounds of timothy will effect tremendous savings. Numerous tests have proved conclusively that horses doing the type of work done by milk dealers' animals cannot use more than approximately one per cent of their live weight daily in roughage. Tests which we are now conducting under careful supervision in this state (Connecticut) may show that considerably less hay can be fed satisfactorily.

Most city horse owners feed straight oats as the only grain. Millions of farm horses in New Jersey, New York, Pennsylvania, through the entire corn belt, and in every Southern state are fed ear corn as either the sole grain ration or ear corn makes up the bulk of the ration Crushed barley because of its higher energy value is being substituted for part of the oats by a number of large city stables with entirely satisfactory results Wheat bran can also be included as a part of the ration if there is any fear that corn and barley are too heavy when bran is selling for a little less per ton than do oats With the present light crop of relatively high priced oats it is doubtful if the most efficiently fed horses will receive any oats in their ration for some months to come

Certainly no milk dealer can turn down the idea of the use of skim milk. This by-product which is often valueless to milk dealers, or nearly so, has showed its excellent qualities as a horse feed in fitting horses for show purposes as well as making up a large part of the regular rations of horses that are on regular milk routes Farmers are occasionally found who sell cream whos sole concentrate feed to their horses while idle or on light work consists of skim milk.

* * *

A COLD WEATHER DRINK.

A hot chocolate drink, "Rossmore," is featured during the colder months by Moores & Ross, well know milk dealers in Columbus, O.

"Rossmore" is made of Rona Dutch cocoa, can sugar, and Gray-Jensen spray powdered milk. The blen is adjusted so that with the addition of one ounce o this powder to a cup of hot water, a delicious hot drin is prepared. It is very soluble, has a smooth flavor an good body. It is not a cheaply prepared product, sinc the cocoa used costs four times more than the ordinar brands of cocoa on the market. Made with hot mil and topped with whipped cream, it is much heavier an a delicious drink.

Moores & Ross supply it in individual envelopes, 10 to the carton, and in 5, 10 and 25-pound tins, as well a in large drums, when required. Jobbers report it to b a great repeater and it is being sold by direct mail campaign and by salesmen. It is a type of product whic responds well to mail selling, since the sample sells itse in comparison with other products of similar type.

Why Some Patents Are Worth So Little

Important Rules for Estimating the Value of a Patent, and Determining the Likelihood of Infringement

By LEO T. PARKER*

THE fact that an article is marked "Patented," means very little except, of course, that some kind of a patent is granted. Perhaps the notification refers merely to a minor improvement, or even to a design patent which is not intended to protect the mechanical or process features of the invention.

Almost every person has had occasion at some time or another to know the broadness or degree of protection afforded by a patent of special interest. However, few persons are inclined to advance the required fee to a specialist in patent laws to obtain the desired information without having definite prospect of profiting by the expenditure.

The result is that almost all of the general information circulating among the people on the subject of patents is "hearsay." And as a rule such information is very unreliable.

For example, many persons believe that a patent is ordinarily renewable—but it is not. The rumor is widely circulated that a "basic" patent is granted for 100 years—but it issues for a term of exactly the same duration as other patents. Many people believe that any person is privileged to make a patented device for his own use, without obtaining permission from the inventor—but such a person is an infringer. Almost all inventors are of the opinion that the patent will be awarded to the person who first files an application—but the established rule of the law is that the government may even **revoke** a patent, where it is shown among other things that someone made the invention before the patentee. Also, many manufacturers believe that there is a penalty prescribed by the law for the unauthorized making and selling of an invention stamped "Patent Applied For" or "Patent Pending,"—but there can be no infringement of an invention thus marked.

And so, it is obvious that much of the "hearsay" information pertaining to patents is very unreliable.

Now we shall assume that a device is marked "Patented," and that a manufacturer or other person desires to become informed of the status of the patent.

The first step of the procedure is to copy the serial number of the patent found stamped on the invention. Then address "The Commissioner of Patents, Washington, D. C.," enclose 10 cents (money, money order, certified check, or New York draft) for each copy of the patent desired, and dispatch the following letter:

"The Hon. Commissioner of Patents,
Washington, D. C.
Sir:—

Please find enclosed ......cents (money, money order, certified check or New York draft) for copies of patents number ....

Very respectfully.

If after the copy is received it is learned that the patent is on a design, then it is merely necessary to compare the drawings of the patent with another device to test infringement. If the two look alike, one infringes the other. But, if the designs are not similar to the eye there need be no fear of infringement. Recently a court explained that a design patent relates only to the exterior appearance of the article, and does not in any sense protect mechanical parts or operations. And, further, that the test for infringement of two designs is whether an ordinary and disinterested observer or pu chaser testifies that the designs are similar. In oth words, in deciding whether one design infringes anoth it is merely necessary to place the two designs before few disinterested persons for examination. If the i spectors decide that the designs look alike, probably i fringement exists, otherwise not. Because it is by th ordinary method of comparison that the court will a rive at a decision.

But let us assume that the copy of the patent r ceived from Washington is on a machine or mechanic device. Then the specification or complete reading ma ter, to the phrase "What I claim as new and desire t secure by Letters Patent is," should be examined car fully so that the investigator thoroughly understand the construction and operation of the invention. How ever, it must be remembered that this portion of th patent **does not** convey information with respect to th monopoly granted the inventor by the patent. As a ma ter of fact, this descriptive part of the patent generall includes a large amount of matter and mechanism c which the inventor has absolutely no protection, as i purpose is **not** to explain the exclusive patented featur of the invention.

After the operation of the mechanism shown in th drawings it is understood attention should be directe to the "claims," which are the only remaining part the patent and being numbered 1, 2, 3, etc., are readi recognized.

Irrespective as to what is contained in the previo descriptive reading matter, the "claims" is the hea so to speak, of the patent. In other words, the monopo granted by a patent is expressed in the claims.

To convey the attitude of the courts, when th validity of a patent is being adjudicated, the followi recent statement of a higher court is quoted:

"The monopoly or strength of a patent is express exclusively by the claims. And although a patentee deserves a stronger patent than is expressed by the clai, he loses the monopoly not described in them."

Also, the Supreme Court of the United States sai, "The scope of the letters patent should be limited to t invention covered by the claims." So, therefore, it i apparent that a person who is desirous of knowing t scope covered by a patent need only read the descripti portion of the specification for the purpose of accumulating sufficient information to be able to comprehen the claims.

The majority of persons labor under the false belief that the longer and more descriptive a claim is, the stronger it is. However, the fact is that a short, brief claim may be much stronger.

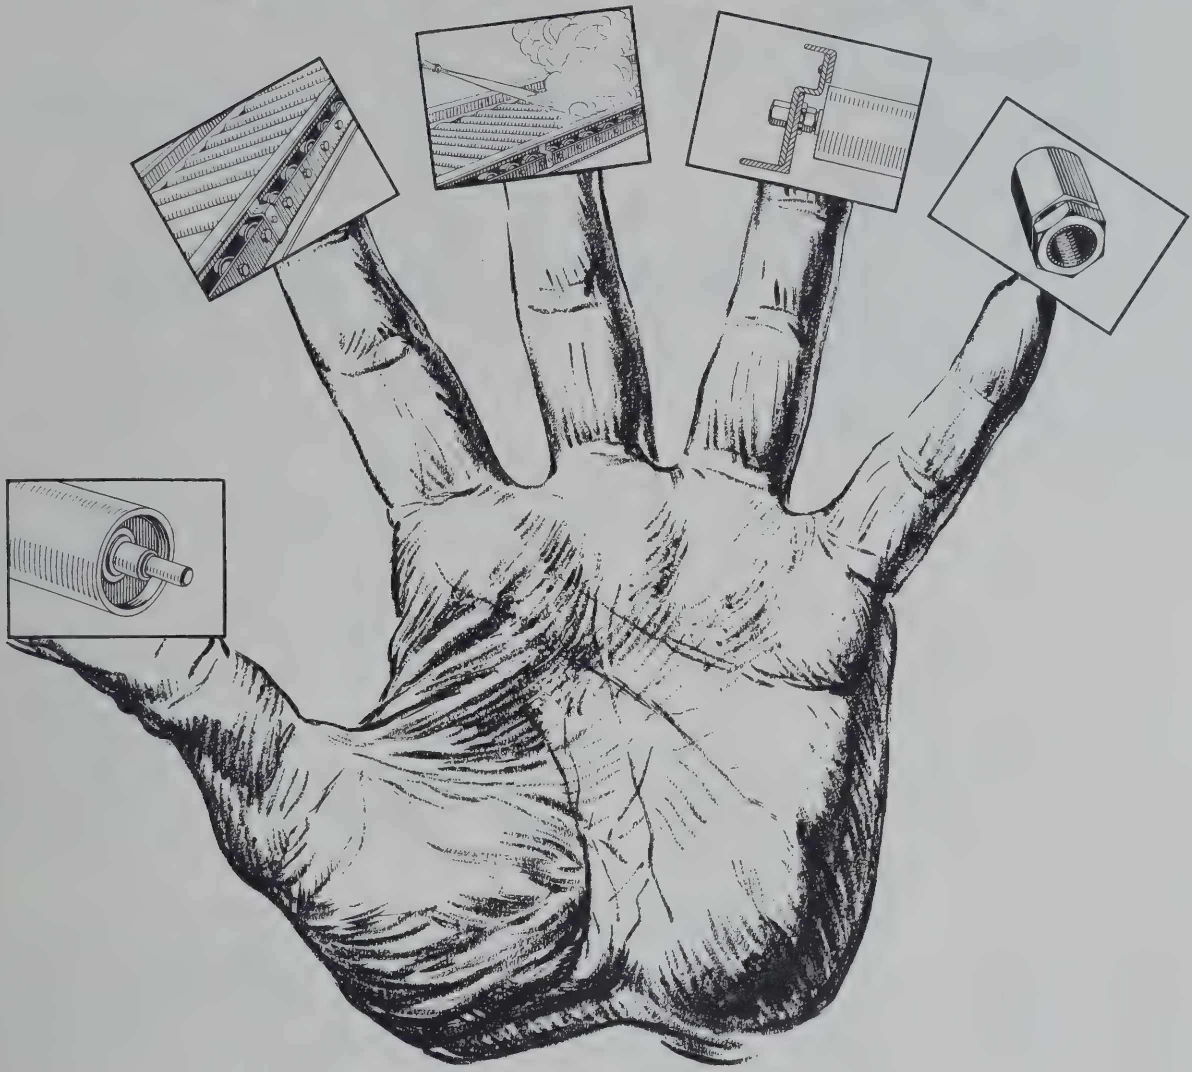
The reason for this is that the rule of the law is well established that any person may manufacture a device which contains **one less part** or element than are enumerated in the claims of a patent, and is **not** an infringer.

For illustration, where a claim reads: "A device comprising a base, a platform, and a support for said platform and connected with said base." The three elements in this claim are: the base, the platform, and the support. And any person may make, use or sell a device in which one of these parts is omitted, provided another part is not included which is equivalent to the

---

* Attorney and counsellor of the U. S. Court of Appeals.

5 Reasons



Why Lamson Sanitary Conveyors Last—

1 *Moisture can't get in.* Corrosion comes with moisture. Keep moisture out and you prevent corrosion. Lamson Rollers, extra-heavy throughout, have heads *welded in.* No joint through which moisture can enter. No inside corrosion. Remember that.

2 *Special guard rail over roller ends.* This heavy angle iron guard rail, setting in over the ends of the rollers, prevents can-chimes from dropping off and blocking the conveyors. *And this saves wear.* Sliding cans over rollers that can't turn wears out the rolls and the cans, both. The Lamson conveyor never stalls or blocks.

3 *Stands up under flushing and steaming.* Turn the hot water on it as often as you please. Steam it often as you want. You can't harm the bearings, you can't force any moisture into any part where it will be harmful. Lamson has designed this conveyor to stand a limitless amount of cleaning.

4 *Practical mounting.* The frame is so designed that it forms a cup-like protection to keep moisture and milk away from the shafts and bearings. This mounting maintains dryness of the moving parts even in conditions where a great deal of moisture is present. It adds greatly to the service of Lamson conveyors, and helps to prevent rolls from sticking.

5 *Non-corrosive bearings of special design.* The bearings are cast of a non-corrosive alloy. They are extremely resistive to all corrosive action. They are hexagonal in shape, so inserted in the frame that they can never turn with the shafts. Consequently, they cannot freeze, and always operate.

Lamson Sanitary Conveyors were specially designed for dairy and milk plant use. They pay for themselves in longer wear and freedom from repairs. Write for statements of users and full details.

THE LAMSON COMPANY, SYRACUSE, N.Y.

LAMSON CONVEYORS

omitted part. For example, where a claim specified gears the court held infringement was not avoided by omitting the gears and substituting sprocket wheels and chain. But where a part is omitted and no other element is substituted, infringement never exists.

By this simple method or rule any person, who understands the thing described in the patent and shown in the drawings, may arrive at a reasonably accurate decision as to whether an invention infringes a patented one.

Therefore, with this knowledge it is easy to realize why some patents are worth so little. Because an inventor may work to perfect a very complicated device or machine, and then file an application for a patent which contains several sheets of drawings, many pages of descriptive matter, and numerous broad claims. But when the application is examined by the patent office officials it may be necessary for the inventor to cancel the broad claims and substitute a few weak ones, particularly if the whole invention is found not to be new. Moreover, a patent that contains claims which describe a previously made invention is void.

Recently the patent No. 1,215,956, for a round box for containing cheese was held invalid, (283 F. 413). The claim of the patent reads as follows: "A round box of the kind described, including a body composed of two thicknesses of veneer bent together into round form, the grain of both thicknesses running in a direction around the body, the entrance being overlaped, and fasteners extending through said overlapped entrance, the said thicknesses lying loosely in direct contact with each other between the fastener ends."

The quite recently decided Bruckman patent litigation between American Cone v. Denaro (297 F. 913) conveys important information with relation to patents.

The facts of the case are that previous to Bruckman's invention of the cone machine in litigation, ice cream cones had been made by baking them in molds from which it was necessary to remove them by hand. This was hot work, and when sugar was used to sweeten the batter the cones adhered to the molds so that removing them was accomplished with great difficulty. Bruckman's invention consisted in making the molds in two sections and the cores are locked into the cones after the batter is poured. When baked, the cores are slightly raised, the mold is unlocked, and the cores are used to force the cones from the molds.

In an endeavor to have this patent declared invalid numerous previously issued patents were brought to the attention of the court, but none were the same, and the patent was held valid.

Practically the same rules apply to mechanical or process patents. And where one of the ingredients or steps specified in the claims is omitted, infringement is avoided.

An example of an invalid process patent is No. 1,356,340 which is for a method of evaporating buttermilk. The court in effect held that the process disclosed in the patent was practically the same as methods previously used. The court said:

"The process described in the specification and embodied in the claims of the patent in the suit......which makes use of a process in the manufacture of buttermilk powder, cannot be distinguished from the process followed and the machines operated by another, the Ekenberg Company, for the same purpose, except possibly, in two respects: (1) the Ekenberg machine was operated under ordinary atmospheric conditions, (2) in the Ekenberg machine the space pipes through which the liquid buttermilk was delivered upon the surface of the heated drum extended across the concave ends as well as along the sides of the drum, while in the Collis machine these perforated space pipes are placed along the sides of the drum and not upon its ends."

Process patents relate to a method of doing something, and a claim specified the acts or steps, instead of elements or parts as in mechanical patents.

In (268 F. 368) is to be found the records of an interesting litigation in which patent No. 860,929 for a process for condensing and pulverizing milk was held infringed. One of the important steps of the process was the admission of heated air through **one slit** into the chamber containing the milk. Another person manufactured the same machine and included **several openings** through which the heated air was admitted into the chamber. However, while infringement of a patent may be avoided by omitting a step, adding to it will not accomplish the same result, and since the patent specified one opening, the person who utilized two or more openings is an infringer.

A SALES BUILDER.

A 32-page recipe booklet, with a beautiful cover, was recently issued to its customers by the Waukesha Milk Co., Milwaukee. Pages and pages of recipes, "delicious when prepared with Waukesha milk," along with several pages devoted to interior views and a description of the milk handling process. A cut of a driver-salesman features the cover page along with:

The milky way is the right way,
It leads to health and happiness.
Digest the recipes within
If you and yours
Good health would win.

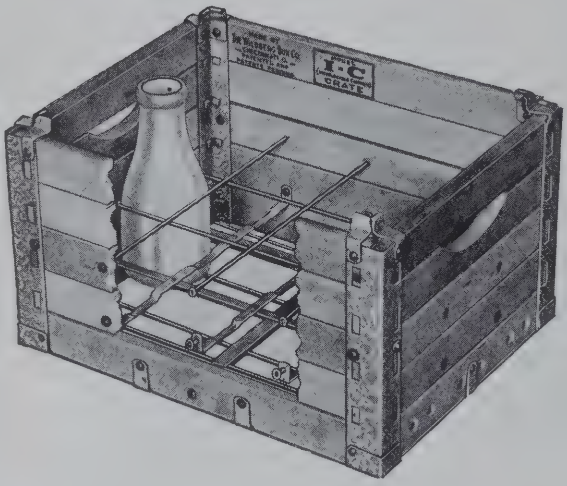
A Milk Bottle Crate

is the HOME of the Milk Bottle

In your desire to keep down your bottle crate bills, be careful to avoid increasing your bottle bills—

The **MODEL I-C (Interlocking Corner) CRATE** will give you the long life and ease of repair you want, *PLUS Maximum Bottle Protection PLUS Ease of Handling*



Our lower row of division wires—twisted flat galvanized steel ribbons—is absolutely rigid and prevents contact between bottles at *Bottom, Shoulder* and *Lip.*

Most strenuous tests have proved that bottles will break easily in any case in which there is "give" in the division wires. Our lower row of division wires is immovable and gives bottle protection found in no other crate on the market.

At the same time, the upper row of division wires is *round* and permits perfect ease of removing two bottles with one hand which is impossible in the ordinary flat ribbon wire crate.

If you have not yet received your free sample of the ➔ fill in the attached coupon.

Carrying charges prepaid and no obligation on your part.

Washed Curd Cottage Cheese

Selling Cottage Cheese a Good Way to Turn Skim Milk Into Money. Make a Better Product and Get More Money For It.

By H. W. VETTERLEIN*

THERE are many kinds of cottage cheese, but so-called "washed curd cottage cheese" is one of the best, in my estimation. This cheese, if properly made, will sell anywhere. It costs a little more to make it, but you can charge more for it, and make a nice profit.

We use a two-hundred-gallon cheese vat. Fill this with sweet skim milk, while separating, and set at a temperature of 82 degrees F., using no starter or rennet. You will have to vary this temperature according to the season, and temperature of the room, in which the vat stands. In very cold weather 88 degrees is not too high, while in hot weather, 78 degrees is high enough.

Let it stand over night and the next day, when it is coagulated all the way through, cut it with regular curd cutters, leaving it in small cubes. Then heat with steam, turning the steam on into the water, in the jacket of the vat. Don't heat too fast, stir constantly, so that the curd on the bottom of the vat doesn't get too hot. Heat to about 120 degrees F., but this temperature depends on the condition of the curd. If heated too high, it gets like rubber. With a little practice, you can tell when it is just right, and it will not be necessary to use a thermometer.

We use a regular cheese strainer, to drain off the whey. When whey is all off, cover the curd with cold water, to which add one pound of baking soda, and thoroughly wash the curd. This removes the acidity, and you have a sweet cheese. Drain off this water, and again cover with fresh, cold water, and again thoroughly wash the curd. Drain again, and sprinkle about two pounds of cheese salt over the curd. Mix well, and add about two quarts of cream, and thoroughly mix again. The quantity of salt and cream can be varied, to suit the trade, but the amounts I have mentioned are just right in this locality. We use forty per cent cream.

We then place it in ten-gallon milk cans and put them in the ice pool, in the cooler, to cool as quickly as possible. The next day, we remove it from the pool, but keep it in the cooler, not allowing it to freeze, which would spoil the flavor.

The soda bath, and cold temperature, insures a low acid cheese that will keep.

We sell some in bulk, and also pack it in one-pound cartons. They are made of paper, and paraffined, making an ideal cheese container. A good plan is to give the cheese a name, preferably a new name coined from the name of the company selling the cheese. For instance, Ohio Valley Dairy—"Ovada." Then have printed on the cheese box covers, "Ovada Creamed Cheese, fresh daily, sold by Ohio Valley Dairy." For this cheese, you can charge two cents a pound more than for common cottage cheese. If you put out a uniform article or product, day after day, you can hold the old trade, and constantly add new business.

The retail milk drivers can deliver it with the milk, and it can also be sold in stores.

Cottage cheese is a good way to sell skim milk, but it requires a careful, conscientious operator, to make it.

---

*Plant superintendent, Sauquoit Valley Dairy Co., Utica, N. Y.

⁂

IOWA TEAM AGAIN WINS.

The 1926 Dairy Products Judging Team, Iowa State College, again won the National Dairy Exposition Cup for team highest in all products.

They won the cup for the third consecutive time this year and Iowa State College, therefore, retains permanent ownership of the cup.

In the various products they were the highest team in milk judging, also the highest team in ice cream judging.

Individual honors were awarded to:

J. W. Tatum was awarded the gold medal for the highest individual in judging all products.

Geo. L. Myers was awarded the silver medal for the second highest individual in judging all products.

J. A. Earle was awarded the bronze medal for third highest individual in judging all products.

Geo. L. Myers was awarded the silver medal for second highest in ice cream judging.

J. W. Tatum was awarded the silver medal for second highest in milk.

Transportation of Milk by Highway

Bureau of Public Roads, United States Department of Agriculture, Studies Milk Transportation Problem and Makes Interesting Comparisons

THE studies of milk transportation were made in the Baltimore, Cincinnati, Detroit, Indianapolis, Milwaukee, Philadelphia, and St. Paul and Minneapolis markets. In all these markets, with the exception of Philadelphia and Baltimore, the studies show that approximately 90 per cent or more of the milk now received is transported by motor truck via highway, instead of by railroad. Philadelphia, which is the largest city surveyed, receives only 20 per cent of its milk by highway; Baltimore 45 per cent, but the latter percentage represents merely the present stage in an increasing tendency which has been marked since 1912, when 20 per cent was delivered by highway. Whereas this 20 per cent was delivered by wagon, the 45 per cent is now delivered entirely by motor truck. The proportion of Philadelphia's total supply which is shipped in by motor truck has been increasing in recent years, but the percentage is low because the city, on account of its heavy demands, must draw its supply from an area so large that the shipping distances become too great for motor-truck hauling.

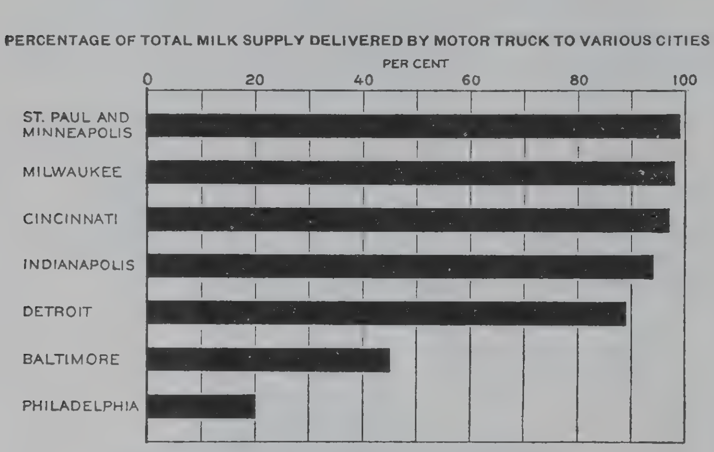

FIG. 46.—The daily transportation of milk into the largest cities is one of the outstanding services of the motor truck and the improved highway. In many cities practically the entire daily supply of milk is received by truck instead of by railroad, as formerly

This distances from which milk is transported to the eight cities by highway and the percentages of the total number of trucks in each market hauling from various distances are show in Figure 48. Only in the Philadelphia and Detroit markets is the longest haul greate than 60 miles. At Baltimore and Cincinnati it is betwee 50 and 60 miles; at Indianapolis it is between 40 and 5 miles; and at Milwaukee, and St. Paul, and Minneapoli it is between 30 and 39 miles.

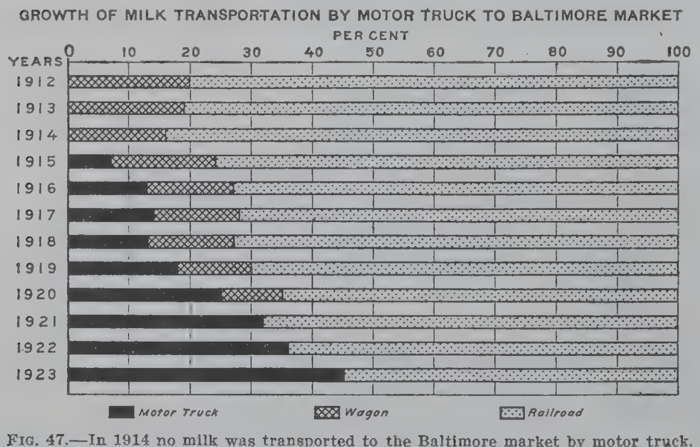

FIG. 47.—In 1914 no milk was transported to the Baltimore market by motor truck. About 17 per cent of the total receipts were delivered by horse and wagon and the balance was shipped by rail. In 1923, 45 per cent of the milk received came in by motor truck

The sizes of trucks used in the Baltimore market fo hauling in the various mileage zones is shown in Figur 49, which indicates clearly that the smaller trucks ar used for the shorter hauls, and the larger trucks for th longer hauls.

The rates charged for transporting milk by moto truck in the Baltimore market conform fairly closely t the rates charged by the railroads. As a matter of fac the rail rates were the basis upon which the truck rate were fixed when the motor trucks first entered the business. No case was found where the truck rate was les than the railroad rate, and in some instances it was foun that the truck rates exceeded the rail rates.

In comparing motor-truck rates with railroad rates however, one must not lose sight of the fact that th motor-truck rates include pick-up service in many case and in all cases delivery service at the city milk plant When shipping by railroad, farmers have to haul thei milk varying distances from the farm to the station and the dairy or city milk dealer is obliged to haul th milk shipped by the railroad from the city terminal t his manufacturing or distributing plant. The dealers i Baltimore estimate that it costs them from 0.5 to 1 cen per gallon for this terminal hauling, which is entirel eliminated where the milk is brought directly to th plant from the points of production in the countr

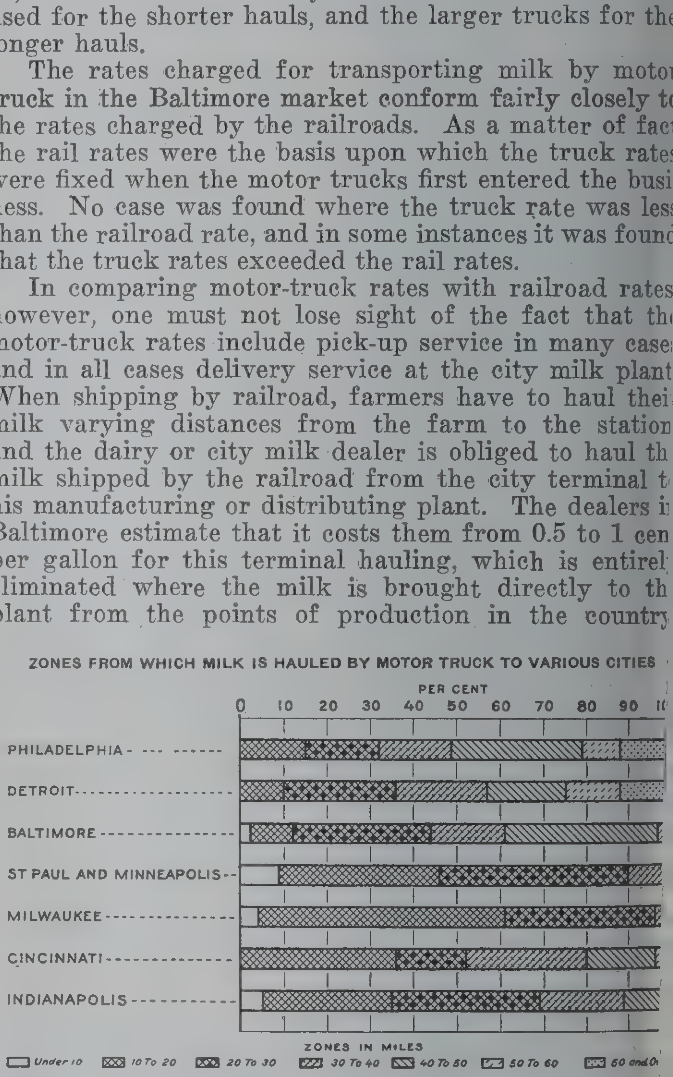

FIG. 48.—The distances from which the milk is hauled to the cities depends so what upon the size of the city and the character of the land immediately arou the city, with respect to its ability to support a dairy industry. Milk is seld hauled by highway further than 60 miles

These costs naturally vary for different dealers, d-pending largely upon the distances they are remov from the railroad terminals. In Baltimore not one the dairies is located directly on a railroad sidetrac, so that in each case trucking, either by horses or motor truck, is necessary to get the milk from the ra-road car or platform to the plant.

The saving in time and expense to producers w ship by motor truck is shown by the following samp data which were secured from questionnaires filled o by milk producers shipping by truck and milk produce shipping by railroad. Forty-eight replies from ea class of shippers were tabulated. Of the 48 shippers truck, 23, or approximately 50 per cent, were located

DOUTHITT MILK POWDER PLANT

GRAY-JENSEN SPRAY PROCESS

DESIGNED AND BUILT BY

DOUTHITT ENGINEERING COMPANY

139 NORTH CLARK ST. CHICAGO

Los Angeles Creamery,	Tulare, Cal.

32 Plants Operating. 6 Plants Being Installed.

WE guarantee to recover on capacity operation milk powder equivalent to 100% of the solids in the milk. No other plant can make such recovery.

No precondensing necessary. No condensing water used. Only water required is for boilers and to wash up plant each day.

Only 1 man necessary to operate plant and pack milk powder in barrels.

The plant is easily kept in absolutely sanitary condition. It can be thoroughly washed and sterilized each day.

Easily and instantaneously regulated to leave any desired percentage of moisture in powder.

½ minute from milk to powder; the shortness of time during which the milk is exposed to heat insures superior quality of powder, entirely soluble in cold water, manufactured at lowest possible cost and sells for highest market price.

The powder is automatically and instantaneously removed from the drying chamber, also cooled as delivered into barrels. Other plants require from 1 to 20 hours to accomplish the same results. Milk powder allowed to remain in drying chamber until the day's run is completed becomes thoroughly mixed while being removed, therefore there is no advantage in grading such powder as the lowest quality made that day governs the grade for the day's run.

The saving in milk powder, fuel, labor and power, as compared to other milk powder plants, is sufficient to pay for one of our plants in from 1 to 3 years. Manufacturers are discarding other types of milk powder plants and installing the Douthitt plant, the life of which is from 15 to 20 years.

We will furnish a guaranteed market for all skim milk powder manufactured on our plants.

We pay traveling expenses of responsible parties sufficiently interested to visit one of our plants.

Write today for booklet describing the Douthitt milk powder plant.

truck routes and did not have to do any hauling. The remaining 25 hauled their milk to convenient points on truck routes, a total of 22.43 miles, or each one hauled his milk an average of 0.86 mile. If these same 48 shippers who shipped by motor truck had all taken their milk to the nearest railroad stations, they would have had to haul a total distance of 117.25 miles. The actual saving to all of these shippers was 94.82 miles, or an average of 1.98 miles for each shipper.

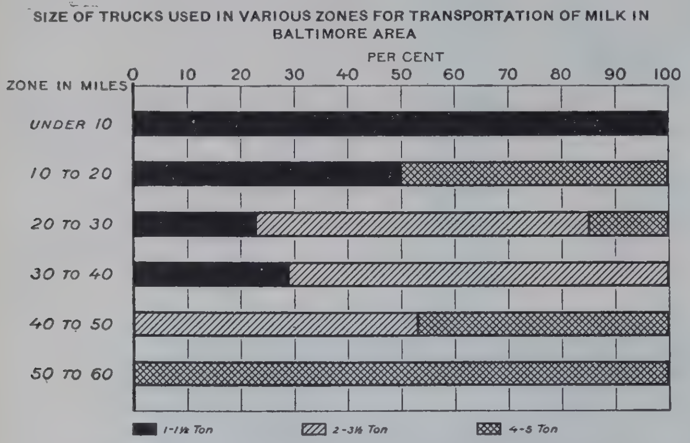

FIG. 49.—As indicated by the practice in the Baltimore market, the smaller trucks are used for the shorter hauls in transporting milk and the larger trucks are kept for the longer hauls

The 48 shippers who shipped their milk by railroad hauled it a total distance of 61.45 miles, or an average hauling on the part of the 48 shippers who shipped by truck was 0.47 mile each. The average saving in hauling distance which the truck shippers enjoyed over the same number of railroad shippers was 0.81 mile each.

It should be noted that this analysis shows also that the milk producers who are most likely to ship by truck are those who are more distantly removed from their respective railroad stations. Shippers who made use of the motor truck were removed on the average 2.44 miles from the railroad, whereas those who shipped by railroad were on the average 1.28 miles distant. To those shippers who are the greatest distance from the railroads and who live on or near roads which are adapted to truck traffic the motor trucks bring the greatest benefits. Through the use of motor trucks operating over improved highways the dairy industry is promoted and developed in regions which hitherto were too far removed from railroads to be developed practically as producing areas for fluid milk destine for the city market.

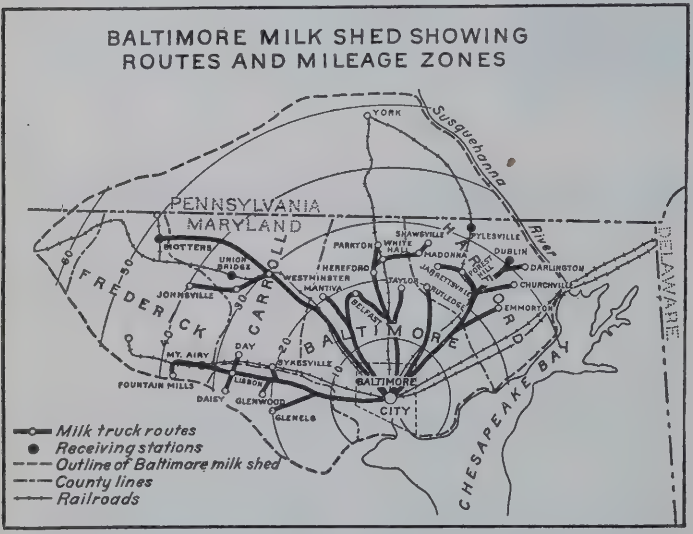

FIG. 51.—The heavy black lines represent regular motor-truck routes. Farmers living on these routes merely place their milk on platforms by the roadside, from which it is collected by the milk truck on its regular trip. Farmers living near the receiving stations deliver to them, and from them the milk is hauled in bulk to the city

The records of the dairy plants in Baltimore show that the motor trucks engaged in this business o transporting milk from the country to the city operate with a great degree of regularity. Snow removal on the Maryland highways is well taken care of, so that the main highways are seldom if ever closed on account o snow. Records are not available for all of the motor trucks as to regularity of operation. It was found however, that for 24 trucks not a single trip had been missed in the years 1922 and 1923. This does not mean that each one of these individual trucks was operated daily. Emergency trucks may have been used at times but no trip was missed on account of unfavorabl weather conditions, and continuous and regular servic was afforded to the shippers and to the public.

Flexibility of operating schedules is an advantag which motor-truck operators claim for their method o transportation. The time of departure in the morning i usually an hour later in the winter than in the summe months, which is a great convenience to the shippers The earlier operation in the summer months makes i possible for the milk to be brought to the city before th heat of the day sets in.

⚜

OUT OF THE SHADOW OF THE COURTS.

It has been a long, hard fight but a complete victor has been won.

The Indiana Manufacturers of Dairy Products w organized in 1917. It has functioned well and has ha not a little to do with the development of the dairy i dustry in the Hoosier state. Creamerymen, ice crea manufacturers and market milk men are organized one trade association and perhaps in no other state h more constructive work been done in the interest dairying. In spite of the splendid work that has bee done, the attorney general of that politically notorio state brought a case against the association and its members, seeking to dissolve the association and drive members out of business.

After a long, hard and expensive fight, the low court decided in favor of the association and gave it clean bill of health.

Under ordinary circumstances this would ha settled the controversy, but things are not done in ordinary way by some Indiana politicians. The attorn general seemed determined to prove the innocent gui and carried the case to the Indiana State Supreme Cou

On October 12th the supreme court affirmed the judgment of the lower court and again gave the India Manufacturers of Dairy Products a clean bill of heal The members of that organization have been put t big expense and a lot of worry just to satisfy political ambitions of a state employee who seemed termined to override the facts as they were unfol during the progress of the trial. He failed and it is w for the industry that he did. There are other associations functioning the same as the Indiana organizat and they are all doing a real service for dairying. Dairymen the country over are under obligations to the m who fought the Indiana case to a successful conclusn.

No Secret

IF anyone has tried to point out to you that Export business is difficult, mysterious and all that, they have had an axe to grind.

¶ All that Export trade requires is:

Suitable Product, Intelligent Sales Plan and Permanence of Effort.

¶ For years American Manufacturers catering to Dairy Industries have had the Product and the willingness to "keep everlastingly at it."

¶ However, the highly specialized, intelligent, *inexpensive,* sales plan was lacking.

¶ After years of continuous research, The Olsen Publishing Company, through its Foreign Department, is prepared to present to you a sales plan ——

o it whatsoever!

—which will bring your product before selected importers who represent the largest buying interests in the world;

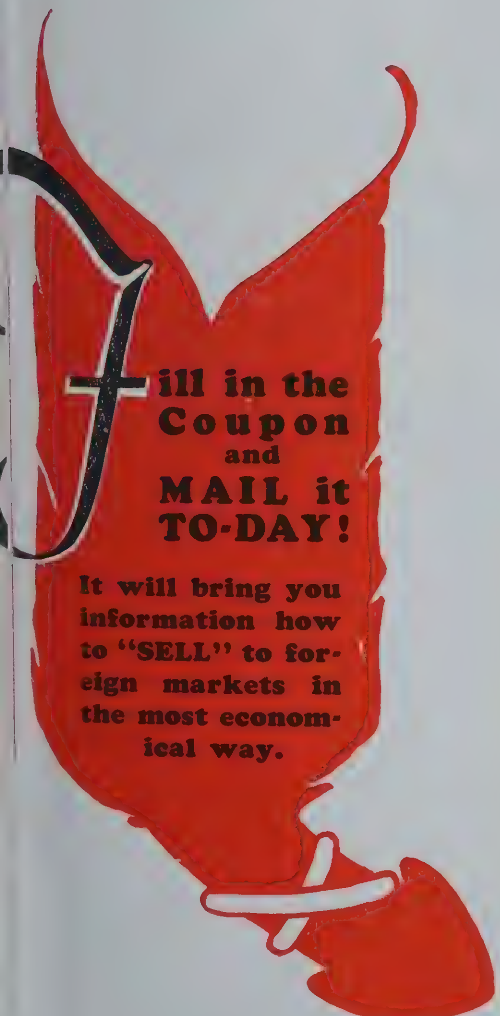
—which will describe your product in the importer's own language;

—will get the attention of these importers—and their orders—more economically than you can do it any other way—it will cost you less than direct mail work—or employing foreign salesmen;

—will bring you larger orders than are usual in this country—because the importer is a long distance away and must anticipate his requirements a long time in advance;

—will bring you business which does away with "open accounts"—business which is financed against bank credits or against trade acceptances;

—will bring you business which is independent of domestic "seasons"—an all year 'round, balanced production, which in itself is one of the best forms of business insurance you can carry.



Fill in the Coupon and MAIL it TO-DAY!
It will bring you information how to "SELL" to foreign markets in the most economical way.

The details of this plan are yours for the asking!

Foreign Department,
OLSEN PUBLISHING COMPANY,
5th and Cherry Streets,
Milwaukee, Wis.

Please tell us all about your plan how to break into the over-seas markets at the minimum possible cost.

A Tom-Pax Filler

for

Cottage Cheese Jars

NEAT, clean, rapid and accurate filling of the popular glass jars for cottage cheese is accomplished with this handy Tom-Pax Filler.

One man can do four times the work with one of these Tom-Pax Fillers.

A creamier, more liquid cheese can be packed without the usual soiling of the outside of the container.

If time means anything to you in filling cottage cheese jars, try out one of these Tom-Pax Fillers. Sanitarily made of durable German silver and Duraluminum that stays bright.

The Determination of Caustic Concentrations of Detergent Solutions Used in Bottle Washing

By MILTON E. PARKER*

RECENT investigation (1) has revealed the necessity for an accurate control of the caustic concentrations of detergent solutions used in bottle washing by automatic bottle cleaners. The active germicidal and cleansing properties of these soaking solutions are determined in a considerabe measure by their caustic strengths—that is, the percentage concentration of caustic soda (sodium hydroxide).

The use of hydrometers or titration with phenolphthalein are not reliable inasmuch as neither method makes it possible to determine the actual percentage of caustic soda as has been shown in recent experiments (2). Therefore, many technicians resort to the method of R. B. Warder for the determination of alkali carbonate and hydrate in the presence of one another (3):

"To the cold solution containing phenolphthalein, hydrochloric acid is added and the liquid is gently stirred with a glass rod. Decolorization takes place when all of the hydroxide and half of the carbonate are neutralized:

(I) $NaOH + HCL$ gives $NaCl + H_2O$

(II) $Na_2CO_3 + HCl$ gives $NaCl + NaHCO_3$

To the colorless solution, methyl orange is added, and the solution is again titrated with acid until the other half of the carbonate is neutralized, when the solution turns brownish-red."

While this method provides an accurate qualitative and quantitative determination of caustic soda in the presence of soda ash (sodium carbonate), its past utility has been confined to the technician. Obviously, the operator of an automatic bottle cleaner does not ordinarily possess the technical training necessary to compute the percentage concentration of his detergent solutions. Inasmuch as investigation has revealed the present methods of hydrometry and titration with phenolphthalein to be inadequate qualitatively as well as quantitatively, it is little wonder that health officers sometimes report the soaking compartments of automatic bottle cleaners in operation to contain as low a percentage concentration of caustic soda as one-tenth of one per cent (0.1%).

With these facts in mind, an automatic caustic testing apparatus has been designed that permits the ready and accurate determination of caustic soda and soda ash by an inexperienced operator. This apparatus has as a special feature, a double scale burette calibrated to give directly the percentages of the two alkalies in detergent solutions.

In operation, the double scale burette is filled to zero with the standard hydrochloride acid solution. A few drops of phenolphthalein is added to the previously measured sample and titration with the acid proceeds until decolorization takes place when all of the caustic soda and half of the soda ash are neutralized as indicated in equations (I) and (II). The point on the right hand (T) scale of the burette registered as the result of this titration is noted. The burette is then refilled to the zero mark and methyl orange is added to the colorless solution. The sample is again titrated with the acid until the end-point is reached, when the other half of the soda ash is neutralized as indicated in equation (III) below.

(III) $NaHCO_3 + HCl$ gives $NaCL + H_2CO_3$

The recognition of the end-point is facilitated by colo standards contained in the stirring rod provided. Th point on the left hand (t) scale reached as the resul of this second titration registers the percentage of sodium carbonate (soda ash) contained in the sample. Th point on the right hand (T) scale registered as the resul of the second titration is subtracted from the readin obtained in the first titration to give the percentage o caustic soda (sodium hydroxide) in the sample.

This testing apparatus also makes it possible to determine the caustic concentrations of washing compounds and by resorting to a simple factor, the analysi of washing powders and detergent solutions containin the bicarbonate (baking soda) as well as the carbonat and hydrate of soda is made possible. This automati caustic testing apparatus has been constructed and assembled by Louis F. Nafis, Inc., of Chicago, Ill.

⁂

IOWA THREE MONTHS DAIRY COURSE.

A three months dairy course is offered at the Iow State College from January 3 to March 18. This known as the winter quarter of the regular six mont course in dairying, but it is taken as a special course a number of young men who do not feel that they a financially able to take a longer course.

Although it is advisable that the students have so practical experience before enrolling, this is not a r quirement. The men who enter for the winter cour are usually, upon the completion of the course, able secure positions in dairy plants. It should be unde stood, however, that inexperienced men taking the wo will not during this short period of time become quafied to take charge of dairy plants in the capacity f managers, head buttermakers or ice cream make They will first be employed as assistants and they w in that way acquire sufficient experience which w enable them to become familiar with the management f dairy plants.

Students entering for work in this course will be cupied in the creamery laboratories six forenoons p week, while the afternoons will be given over to lectu s and recitations. The following subjects will be studi.

Buttermaking
Cheesemaking
Milk Testing
Creamery Management
Judging Dairy Products
Market Milk
Dairy Bacteriology
Dairy Cattle and Management
Farm Crops Production

For further information, address Dairy Departmt, Iowa State College, Ames, Ia.

Only 100 dollars will put in your plant:

A two section soak and rinse tank for bottles,

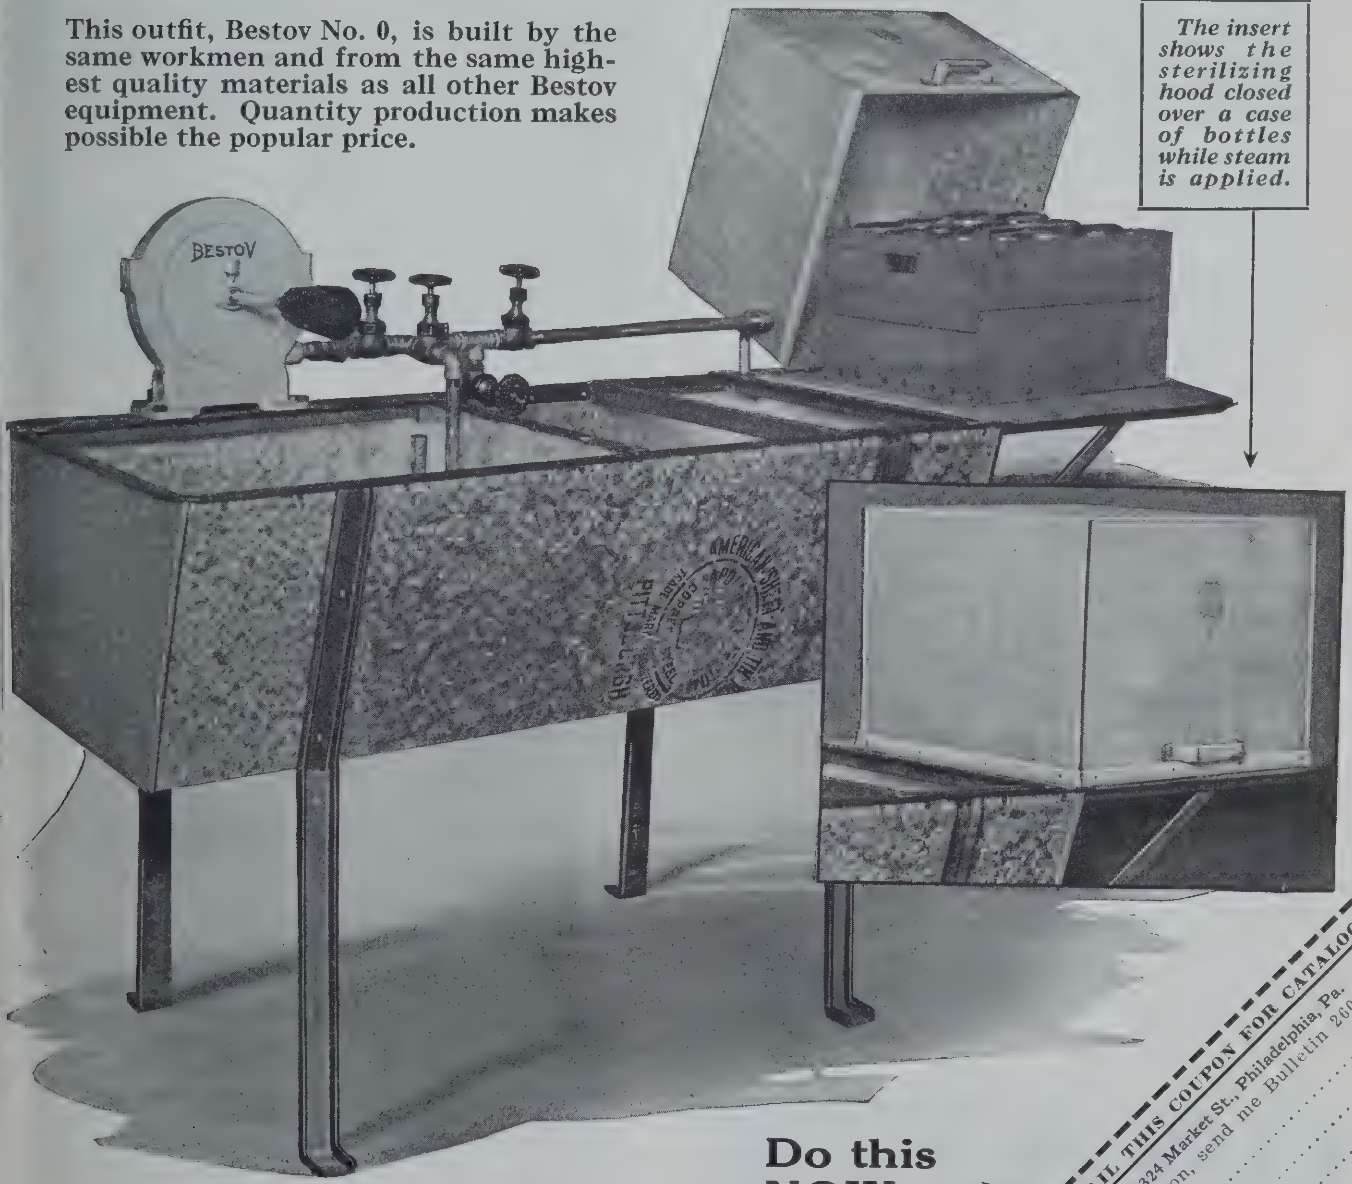
A steam operated bottle brushing unit,

A steam sterilizing unit which handles a full case of bottles at a time,

—all assembled ready to thoroughly soak, brush, rinse and sterilize your daily batch of bottles. An easy job for one man.

This outfit, Bestov No. 0, is built by the same workmen and from the same highest quality materials as all other Bestov equipment. Quantity production makes possible the popular price.

The insert shows the sterilizing hood closed over a case of bottles while steam is applied.



OPTIONAL BRUSHER UNITS
With 1-brush, belt driven $91.00 complete.
With 3-brush, belt driven $112.50 complete.

Quick dissolving!
Effective cleaning!
Free rinsing!

THESE are the requirements you look for in the cleaners you use. And these are *exactly* what you get with OAKITE. Not forgetting the assurance that this modern detergent is SAFE to use.

Here is an easy way to prove this to your satisfaction—

Call in our nearest Service Man. Let him show you the OAKITE way of cleaning pasteurizers, coolers, bottles, cans, and other equipment. Judge the results critically!

First observe how quickly every particle of OAKITE dissolves. Then see how effectively casein is softened for easy removal by light brushing; how completely grease and dirt yield to its quick cleaning action. And note how evenly the rinse water—without a trace of break—flows from surfaces cleaned the OAKITE way.

Write us — we can help you as we have so many others.

Oakite Service Men, cleaning specialists, are located at

Albany, Allentown, Pa., *Atlanta, Ga., Baltimore, *Boston, Bridgeport, *Brooklyn, Buffalo, Camden, Charlotte, N. MILK COMPANY FINDS NEWSPAPERS BEST ADVERTISING MEDIUM.

"Newspapers have been, and will always be, considered the best medium for reaching consumers of food products," it was declared by M. H. Stewart, advertising manager of the Golden State Milk Products Co. of San Francisco in an address given before the Sacramento Advertising Club.

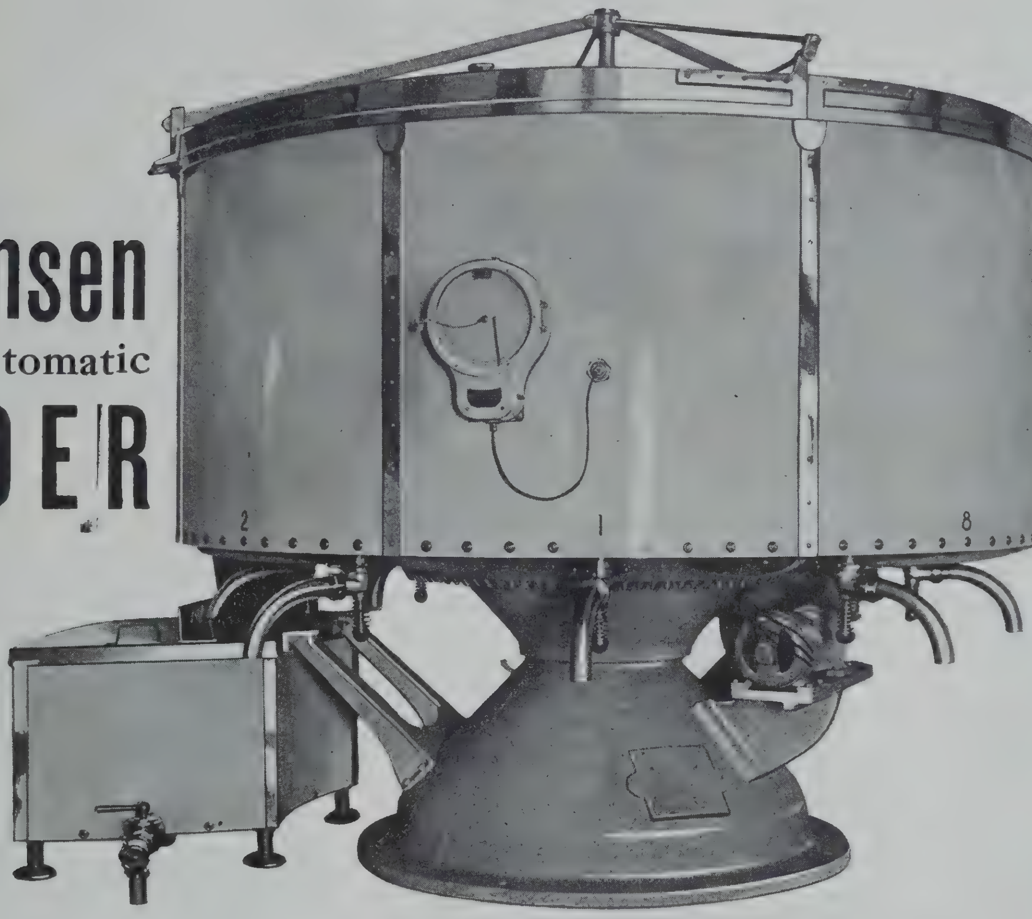
"Newspapers," declared Mr. Stewart, in explaining how the largest creamery company west of the Rocky Mountains does its advertising, "must always be counted of first importance by advertisers who wish to reach the homes."

"The newspaper," said Mr. Stewart, "is the most important medium of any for reaching the housewives. The daily paper goes into the home as an invited guest —it is bought and paid to come in. The advertiser who would reach the people in their homes has no better way of doing so than becoming a part of the daily paper."

It was also pointed out by the speaker that no advertising campaign, no matter how clever, could hope to succeed unless the goods being advertised are satisfactory and of high quality. He attributed a large share of the remarkable success of the Golden State Co. to the fact that its years of consistent advertising have been built upon goods which are rated as being the highest quality dairy products manufactured in California.

Pasteurizing more pounds of Milk per foot of floor space

Mortensen
Positive Automatic
HOLDER



Within a space of 10 feet square you can automatically pasteurize as high as 20,000 pounds per hour. You can handle this volume with greater facility, less labor and at lower cost.

The Mortensen Positive Automatic Holder is proving its economy and practicability to an ever increasing number of users.

Why don't you, in the interests of plant efficiency, make a thorough investigation of this equipment?

REVIEWING THE PAST AND PLANNING FOR THE FUTURE.

(Continued from page 26)

through other sections, such as the production, laboratory and plant. As time goes on we should not fear any step that would tend to increase the value of the association's service to the individual member, so long as we can assure ourselves that such service will be of real value to the members, and a credit to the association.

Accounting Bureau and Controllers' Council.

Our major activity, that of securing the installation of the international cost system as conducted through the cost accounting bureau, has made a splendid showing, considering the illness of so many of our executive staff. Shortly after the convention last year, the manager, Mr. Bolitho, was taken seriously ill and did not recover sufficiently to return to duty until the first part of May. This materially slowed down the accounting work, although he personally was able to complete or to assist in the installation of six additional systems and attend six district meetings.

Shortly after the convention, meetings were held in Los Angeles and Oakland, Calif.; Portland, Ore.; and Seattle, Wash., having solely to do with the accounting bureau. Each of these meetings was well attended and reports of the members on the coast convinced the executive committee that the time and effort was fully justified.

In the late spring of this year, meetings were held at Atlantic City, N. J., and Chicago. A distinct feature of these district meetings is that each one has a larger attendance than its predecessor.

Even with these handicaps, the record shows that to date out of 305 members, we have 146 subscriptions to the system, 19 installed, 24 are in the process of installing, and 21 have made partial changes based upon the manual. Your board is convinced that this work has been of the utmost benefit to the association and the industry at large, but urges as fast as conditions and revenues will permit, a greater amount of field or member plant work.

The board is thoroughly convinced that there is no other one activity that will go as far to create intelligent competition and eliminate vicious comptition as is accounting knowledge, made possible through the international system and the operation of the accounting bureau. We again ask you to pledge it your fullest and heartiest support.

Standardization of Equipment.

H. H. Forster of the Pure Milk Co., Ltd., Hamilton, Ontario, and the chairman of our committee on standardization of equipment for the past several years, rendered such a signal service to his association and to his industry that he has created such a place for himself that each succeeding president has found it impossible to locate a worthy successor. History repeated itself in this respect the past year.

At Mr. Forster's request, the committee that worked with him the previous year was retained and strengthened by adding several other strong plant managers and engineers thereto. This committee the past year included M. Van Antwerpen of the Gridley Dairy Co. Milwaukee, Wis.; F. E. Goldsmith of the Borden's Farm Products Co., New York; O. B. Schier of the Western Maryland Dairy, Baltimore, Md.; and T. N. Westlake of the Sheffield Farms Co., New York. The activities of this committee speaks so loudly for itself, through the chairman's report, that it needs scarcely any comment from the chair, other than to say that they have consisted of (a) very intensive work, in a plan of co-operation with the manufacturers of dairy plant machinery and equipment looking toward the determination of faulty equipment, and the steps to be taken to make such changes as would eliminate those objections—this from the sanitary aspect and design of such equipment. The committee has been most intensively engaged in this work and the chairman's report will be well worth listening to. (b) Continuation of the committee's efforts in agitating the use of the sanitary thermometer connection for vats—and the accompishment of a standard sanitary connection for glass-lined tanks. (c) The continuation of their well devised program looking toward the further elimination of heights of milk bottles and the determination of a plan of co-operation with the bottle manufacturers and the U. S. Department of Commerce for the elimination and prevention of the further adoption of freak bottles.

As the executive committee has observed the activities of the standardization group, they cannot bring t your attention too strongly the unselfishness of the services of these men, and the value of that service to you in your every day business. This is a committee whose activities should be perpetuated and kept in constant service. When a committee such as this one, made up o busy men who are willing to leave their plants for several days at a time to work for your interests, it is a service that should be given fullest recognition.

Agricultural Colleges.

To those who are not closely in touch with the activities of this committee, which was first appointed in 192 for the purpose of co-operating with the heads of th dairy departments of our agricultural colleges, it should be pointed out that a very material service is being performed for your interests by this group of men. work is being done under our fellowships at Wisconsin and Cornell Universities, the splendid spirit of co-operation that has recently developed between the dairy colleges and our industry, and the plans for working programs as between our industry and our several dairy institutions, all are results of the activities of this particular committee.

Dr. F. D. Walmsley of the Borden's Farm Products Company, Chicago, who has headed it for the past two years, has brought a live and definite working program to this committee, that should deserve your very careful attention. His report will be of intensive interest this year.

Transportation.

Those of you who are familiar with the recent agitation of the New England States for an advance in milk and cream rates may not be aware of the splendid work that is being done by your transportation committee under the leadership of H. S. Van Bomel of the Sheffield Farms Co., New York. As the outcome of this case, which is now in progress, will have a vital effect upon the rates of the entire country, his report this year will be of unusual value. I am informed that he will have a very splendid message for you.

Bottle Loss and Breakage.

One of the most important committees that has been called upon to function since the formation of our organization is that of bottle loss and breakage, and your earnest attention will be called to the report of that committee through its chairman, W. J. Kennedy of the Detroit Creamery Company, Detroit.

This committee has just gotten under way in this important work and for the coming year will need your most earnest support and careful co-operation.

Bacteriological Methods.

At the sessions of the laboratory committee last year and following the recommendation of Dr. Breed, a special committee was appointed by Chairman Dotterrer of the laboratory section known as the bacteriological methods committee under the chairmanship of George B. Taylor of the Chestnut Farms Dairy, Washington, D. C., ably assisted by W. B. Marcussen of the Borden Farm Products Co., New York; Dr. William Price of the Detroit Creamery Co., Detroit, and R. C. Fisher of the French Bros.-Bauer Co., Cincinnati, O. This committee was appointed to co-operate with Dr. Breed and other national dairy organizations, looking to the study of bacteriological methods and laboratory control in the plant.

Five of our leading laboratory directors have given unstintingly of their time the past year in this study and bringing in a report of splendid accomplishment, which you will hear Thursday at 2:00 P. M. at the meeting of the laboratory section. From my personal knowledge of the work which they have done, the activities of this committee should be continued.

Better Milk Supply.

The production section at Milwaukee became so interested in the possibilities of this group that they called for the appointment of a special committee to make a study during the year of ways and means for a better milk supply. This committee reported at Indianapolis last year and their work received such approval of the convention that they were instructed to continue their activities.

During the year just closed, H. D. Davis of the Supplee-Wills-Jones Milk Company, Philadelphia, Pa., continued as chairman with his able colleagues: F. J. Capouch of the Bowman Dairy Co., Chicago; and C. R. Nickolls of the Freeman Dairy Company, Flint, Mich. They will submit a report for the adoption of the production section, which should eventually form a material guide for the use of milk dealers throughout the country.

Accounting for Products in the Milk Plant.

The work of the committee on accounting for products in the milk plant in co-operation with a similar committee from the controllers' council was so splendidly performed a year ago that when submitting their report to the membership at large very few criticisms were received. Slight changes have been made to the association's pamphlet on this subject as a result of these suggestions and a joint meeting of these committees was held yesterday.

The revised booklet on accounting for milk products through the plant will go to you shortly after the close of these sessions.

The thanks of the convention are due to Chairman D. S. Adams of the St. Lawrence Dairy Co., Reading, Pa., and his associates, F. H. Kullman, Jr., of the Bowman Dairy Co., Chicago, and Dr. R. J. Carver of Moores & Ross, Inc., Columbus, O., for their splendid work in co-operation with the controllers' council committee.

This pamphlet should be in the library of every milk dealer of this association as a working guide.

Membership.

While there has been no special membership campaign put on this year for securing members, there have been 38 new members admitted and 27 members lost by resignations and other causes, making a net gain of 11.

This is a splendid testimonial of the standing and the impetus this association has gained in its own industry.

At the same time I cannot help but feel there are a number of progressive dealers whose methods of doing business and their own reputations not only entitle them to membership in the association but whose duties to their industry should involve membership. I am going to ask each member of this association to search his mind during the coming year and ask himself the question if there is not some one dealer that he knows who does qualify and should be discharging his duty to himself and to his industry in forming this alliance, and ask the executive secretary for an application blank and see if you cannot bring in at least one additional good man into our group during the year.

Finances.

Our treasurer's report will show that we have no only kept within our budget but that we are in a healthy financial condition, even much better than we had planned to be. This was due, however, to causes which should not mislead us. Unfortunately, our accounting bureau work, as previously commented upon, has suffered a serious set-back during the year, owing to the long and continued illness of our manager of the bureau Mr. Bolitho. Had he been able to carry on as we had hoped, we should have spent considerably more in the promotion of the work of the accounting bureau throughout the country.

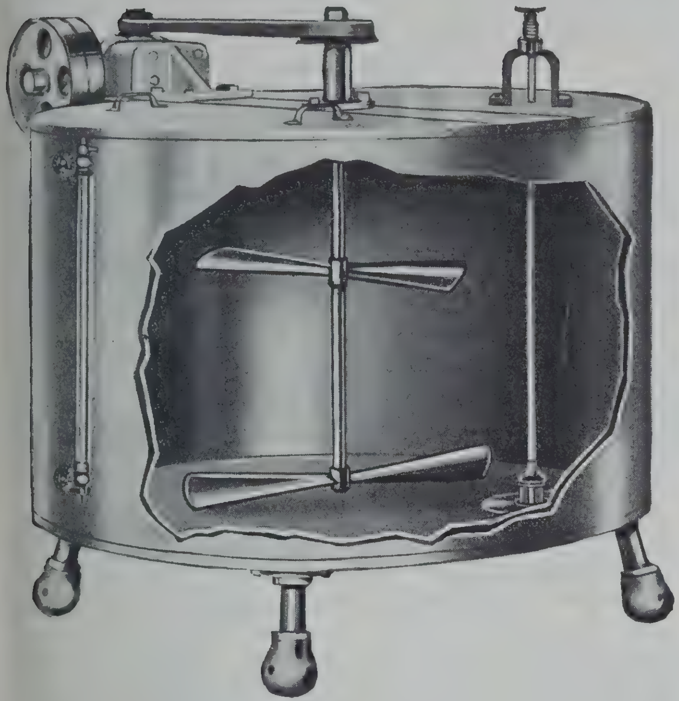
While on this subject the treasurer reports a mos wholesome situation with regard to delinquent dues. A the close of this fiscal year on September 30, there were only 11 delinquent members or a total of $873.83, which is only 1.9 per cent. Our executive secretary informs me that of this amount he feels sure that he can bring in better than 50 per cent, which will leave only abou $400 to write off.

This record of almost 100 per cent collection of dues

"More Than Pleased"

with

CRESCO Pasteurizer



"On April the 15th, 1926, I purchased a Cresco Pasteurizer.

"After giving it a thorough test for the past months, during the warm weather, I find that it does wonderful work. It gives the milk a fine flavor and shows a very good cream line. I am more than pleased with your pasteurizer.

"Since having this pasteurizer installed I find that my trade is more satisfied with this pasteurization than it was in the old way. I have gained considerable new trade during its use."

— Chas. F. Hawker, Elgin, Ill.

The CRESCO Filler and Capper

also does wonderful work in every milk plant using it. Equipped with automatic feed and discharge. Motor or belt drive. Fills and caps milk bottles with speed and economy.

Harrison Station, Newark, N. J.

*Note: The exact amount to use depends on the strength of the Gelatin. If a lower grade is used, more is needed.

can mean but one thing and that is the member dealers must feel that they belong to a wonderful organization and are getting their money's worth many times over.

Of course, I should probably add that this figure does not include those members suspended for non-payment of dues, which amounts to $1,472.83, which would increase this percentage to 3.12 per cent. But even with this figure, we show an unusually low percentage of delinquency in dues.

Code of Ethics.

Our code of ethics in several respects has been put to a severe test during the year. It has in the main not been found wanting. The secretary's office has had not a few cases called directly to his attention of unethical practices that were being indulged in by certain dealers, not necessarily members of the association, but because of the moral influence of our code has caused our own members to refrain from meeting the competition and indulging in similar practices.

In the president's address last year, he pointed out the bribing of managers of apartment buildings and that this practice should receive the condemnation of this body, which it did. The effect of the code so far as this particular instance is concerned has been most wholesome.

Only recently another situation has been called to the attention of the central office where certain dealers are accomplishing an extended cream line, through the homogenization process. This practice is not a new one, and was considered by the code committee in the beginning and frowned upon as doing violence to the ethics of our industry. Let us urge you at this time to renewed pledge in the support of that provision of our code which declared this a reprehensible practice and one not to be engaged in by the progressive and honorable milk dealer. It is a fraud upon the consuming public and, as stated by Past President Ewing, can only lower the dealer's respect for himself.

There has recently grown up within the industry a practice on the part of certain designers and patentees of various devices of more or less questionable value whereby they seek to enter into an exclusive contrac with one dealer in each city, whereby the use of such device is granted to one member and denied to another It should be obvious that such practice can have but on result—the retaliation in one kind or another, and generally the one most vicious of all, and to be feared th most, that of cut-throat competition.

I contend, and I believe in this I have the suppor of the entire assembly, that anything that is good enoug for one member, that in any way spells progress fo that member, should be good enough for all of us an spell progress for all of us. And if it is not good enoug for all of us, it should be rejected by any one of us.

I sincerely trust that the committee on constitutio and by-laws, which has in charge the code of ethics, wi bring in, and I understand it will, recommendations fo the code which will place this assembly unequivocall on record as to these practices, which should merit th condemnation of a progressive and honorable industr

◆

ADDITION TO IOWA PLANT.

Work will be started immediately on the 38 by foot addition to the Charles City Creamery, Charles Cit Ia., which is owned and operated by Hanson & Sorens This improvement will be of hollow tile, with stucco fi ish, and will cost about $15,000.

The addition will house modern equipment for th clarification and pasteurization of milk and cream.

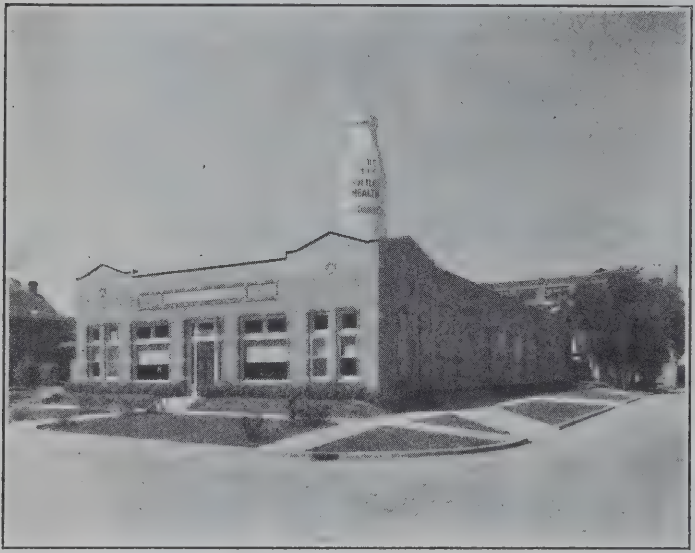
Gaining Efficiency by Proper Arrangement

New Illinois Milk Plant Well Designed for the Economical Handling of Product

BUILT on a famous historical spot in Freeport, Illinois, is the new and modern plant of the Union Dairy Company, erected at a cost of $60,000, at the corner of East Douglas Street and North Adams Avenue, in the same block where the second Lincoln-Douglas debate was held way back in 1858.



The Union Dairy Company's New Building at Freeport, Ill.

The company was founded in 1916 by Messrs. C. F. Kaiser and A. J. Hill and under their careful management the business grew to the point where a new building was a necessity. The plant is certainly a fitting tribute to their efforts, as it is one of the finest dairies in the Middle West. Practically all new equipment was installed, only two machines being moved from the old plant.

The exterior of the plant is an investment in good appearance. The major part of the walls are of light tan colored face brick with warm red face brick and Bedford stone trim, effecting a pleasing contrast. The coping is also of Bedford stone harmonizing with the gleaming white bottle mounted on the roof as shown in the illustration.

The driveway at the rear is covered and is used by the route trucks and farmers bringing in the milk. This protects the platform for incoming milk from the sun and weather.

The small door in the wall on the right side of the building opens directly into the refrigerated milk storage compartment and allows for convenient loading of the milk into the retail route wagons and wholesale delivery trucks on the drive.

There is also a drive on the left of the building from which the empty bottles and returns are unloaded into the washer room. After unloading, the horse-drawn wagons or the trucks follow this same drive to the stables and garage.

This unique arrangement of the three drives for receiving the milk, loading the delivery wagons and return of the empties makes it impossible for one line of vehicles to block the movement of another, which is an important consideration in the erection of a modern plant.

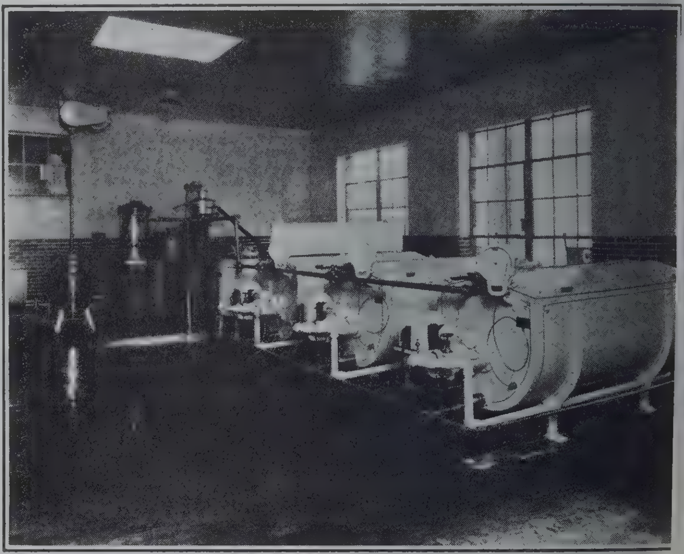
The garage and stable are on the left of the plant, also built of face brick with stone trim. The garage houses three cars. The stable will house 14 head of horses with a loft above large enough to hold the necessary feed.

Factory type windows are used in all parts of the building, except for the front windows in the retail salesroom and offices.

The huge bottle on the roof stands 14½ feet high, and is nearly six feet in diameter at the base. It is built of wood, covered with canvas and protected from the weather by gleaming white enamel. According to the owners, this is the best investment in publicity they have ever made because it does attract the attention of the passers-by.

Entering the front door we step into the attractive retail salesroom and offices.

A door at the extreme left of the salesroom leads to the milk pasteurizing room. The drivers' room is direc ly in the rear of the main office on the left side of th building. There is no door between the two rooms, how ever a counter and window connect the two. Milk dea ers who have wondered how to keep the drivers fro bothering the stenographers and bookkeepers will appr ciate the value of this little feature which makes it in possible for the boys to get into the office.



Where the Pasteurizing and Filtering of the Milk is Done.

The raw milk is received intermittently during th morning at the rear of the plant. Conveyors bring th cans from the trucks to the sampler, who grades an dumps the milk into the weigh can mounted on a su pended type scale.

The can washer is just at the left of the weigh tan It is equipped with a self-righting arrangement dischar ing the cans and covers onto the platform to be load again by the farmer. With this arrangement it is pos ble for one man to receive upwards of 10,000 pounds

---

[**Editor's Note**—We are pleased to be able to present to readers of The Milk Dealer this complete description of the "layout" and arrangement of this modern dairy plant. We are indebted to the J. G. Cherry Company, Cedar Rapids, Ia., for illustrations and descriptive matter, that firm having furnished much of the equipment.]

milk, sample it, weigh it, and wash the cans as fast as the milk comes in.

The milk is conducted from the weigh tank to a 300-gallon receiving vat in the milk room shown at the extreme left of illustration No. 2.

The milk room is a thing of beauty with its shining red tiled floor and brown glazed brick side walls. The room is well lighted with factory type windows and skylights. Ventilators are in the roof. A gutter along the wall in the rear of the pasteurizers allows flushing and draining and does away with uneven floors found about the drains in most plants.

From the receiving vat the milk flows by gravity into a continuous milk pre-heater, driven from overhead. The milk is pre-heated to 110 degrees F. before discharge into the filter shown mounted on the platform. No pump is needed to force the milk through the filter as this is accomplished by the centrifugal pre-heater.

The pre-heated and filtered milk is discharged into three 300-gallon milk pasteurizers, driven by direct motor drive. These machines are equipped with the latest type flush valves conforming to the rulings of the Illinois department of health.

After pasteurization the milk is pumped by a centrifugal milk pump to the tubular cooler shown in illustration No. 3.

The tubular cooler is made up of 14 3-inch tubes, 10 feet long, connected to use both water and brine, equipped with top distributing pipe and a large 12x18 inch bottom trough. The cooler is enclosed in plate glass with a glazed brick wall as the lower portion of the enclosure.

The 100-gallon upright pasteurizer at the left of the milk pasteurizers is used for pasteurizing cream for table use. Sanitary connections bring the milk from the filter to the separator and then to the cream pasteurizer.

Bottles are conveyed automatically from the washer to the bottle filler. A conveyor conducts the filled cases into the cooler through the small door standing open in the right center of illustration No. 3.

On the opposite side of the milk room from the pasteurizers is a direct motor drive churn and butter worker, also a 100-gallon upright mixer and a 100-gallon starter can—both of the latter are motor drive. These two upright machines are used for pasteurizing cream for buttermaking, also making Bulgarian buttermilk and chocolated milk.

It is interesting to note that every machine in the milk room is direct-connected motor drive thus eliminating all unsightly line shafts, pulleys and flapping belts. Note, too, the absence of all sanitary pipe supports from the ceiling, thus giving a full, clear view of the beautiful glazed and tiled room.

The double doors at the foot of the steps in illustration No. 4 lead to the boiler room. In this room is the storage heater for heating the hot water used in the milk pasteurizers. This storage heater is fitted with a controller which automatically holds the temperature of the water at an established point thus giving this plant al the advantages of a low temperature heating medium The water is pumped from this heater to the milk pasteurizers.

The boiler room also contains a 60 h. p. boiler, a 25 ton ice machine, an artesian well and pump, a wate softener and storage tank. The water softener filter

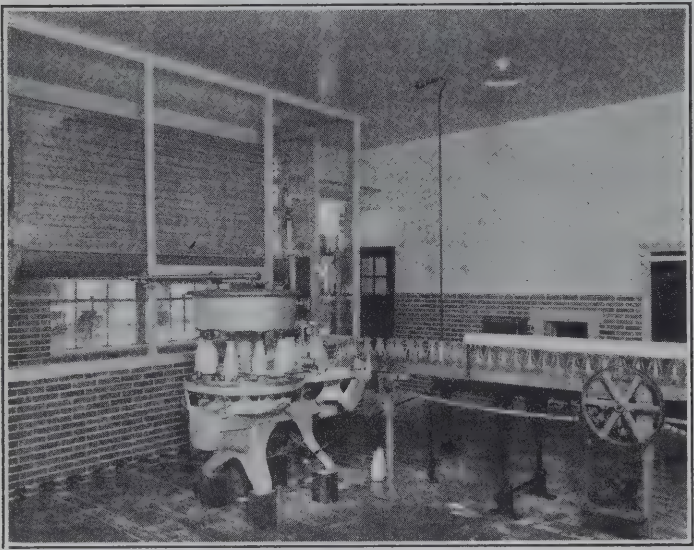
and softens all water used throughout the plant, eliminating scale in the boiler and piping.

The plant is now processing about 5,000 quarts of milk and cream each day. In addition, manufactured buttermilk and chocolated milk are also bottled and retailed. "Wonder" cottage cheese is a leader "to the tune" of about 150 pounds each day. Approximately 500 pounds of "Blue Ribbon" butter is marketed each day.



In the Milk Bottling Department. Everything Direct Motor Driven.

The new equipment easily accommodates the present demands, but as C. F. Kaiser, president and general manager, remarked when interviewed, "We have always wanted to reach out aggressively for new business and now know that we are equipped to handle a greater volume—and we're going after it." Space was planned for an additional 300-gallon milk pasteurizer, which will be installed when needed.

The following paragraphs, clipped from the Freeport Journal-Standard previous to the formal opening of the plant, gives a brief history of the growth of the concern:

"The formal opening of the new and modern dairy products manufacturing plant of the Union Dairy Company at the corner of E. Douglas St. and N. Adams Ave. on Friday, Aug. 27, is the realization of a dream which has ever been in the minds of the proprietors, C. F. Kaiser and A. J. Hill, and marks the result of ten years' effort in supplying 'Blue Ribbon' dairy products to citizens of Freeport and really is a monument to their efforts and industry.

"In 1916 when the partnership was formed both Mr. Kaiser and Mr. Hill were marketing milk from their own herds and conducted their own routes. In those early days only raw milk was handled. The adoption of the pasteurization process as soon as the Union Dairy Company was organized indicates the progressiveness of its organizers.

"Business gradually increased throughout the first thre years. As time advanced and business increased, adde routes were necessary until today the company operate eight horse-drawn retail routes and two wholesale deliver routes covered by motor trucks for the convenience of thei customers.

"Union Dairy products are delivered every day betwee midnight and daylight to hundreds of customers in Freeport In addition to the local business, the products of the company are to be obtained in Forreston, Polo, Aledo, Stockton, Cedarville, Dixon and Sterling. Only milk and crean were handled in the early days. 'Blue Ribbon Brand,' 'Wonder' cottage cheese, Bulgarian buttermilk or chocolated mil have since been added in response to the demands of th trade.

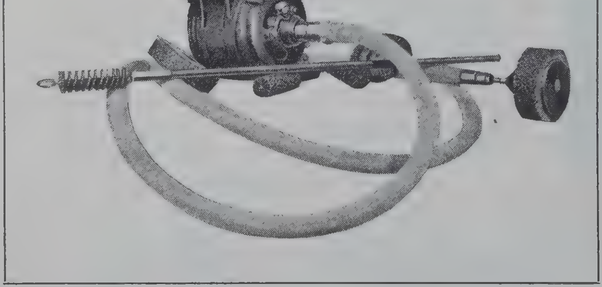
"Milk and milk products are chief among Nature's healthful foods, hence a new plant in this community dedicated t the manufacture of the highest quality products is a welcom asset."

The formal opening of the plant was held on Friday August 27, when several thousand customers and friend visited the plant. To the person attending the opening guessing the capacity in quarts of the huge bottle o the roof of the building was awarded $5 worth of mil tickets free.

Where "Blue Ribbon" Butter, Bulgarian Buttermilk and Chocolated Milk Are Made.

Every customer was invited to attend the opening receiving a personal letter through the mails the d before.

The management served a banquet in the milk roo to the 52 members of the Stephenson County Medic Society on the evening preceding the opening, thus g ing the doctors an opportunity to inspect the plant. A expert lecturer on the value of pasteurized milk in t diet gave the address of the evening.



The King Cleaner *vs.* Steel Wool and Harsh Brushes

RESULTS—Both will keep Sanitary Piping and tubular pasteurizing equipment perfectly clean,—but—the King Cleaner will not ruin the tubing, and requires far less time and effort for the work.

Send us diameters and lengths of tubing in your equipment and we will advise you size and price of Cleaner needed.

THE PERCENTAGE AND CASH SYSTEM.

(Continued from page 27)

own. Each man is paid according to his own ability and progress instead of by the hours he puts in. No salesmen's rate of commission is cut from what they start with and there is no limit to what they can make.

Personally I think it is the best and only way to pay milk salesmen, and I wouldn't care to work under any other system.

By Max J. Gray, Salesman.

My experience working on a percentage basis is more satisfactory because I know that the more I sell the more money I make. It also induces me to work much harder for new business. I have made a rule with myself to solicit at least six prospects every day, besides delivering my regular route.

Selling tickets and collecting in advance for them, or getting the cash each day, is the most satisfactory because it relieves the house and myself of losses in bad accounts, and it also allows me more time to solicit new business.

Under this cash and percentage system I have increased my earnings over 50 per cent in the last 18 months.

By W. W. Rhett, Salesman.

Milk selling on a commission basis is preferable bot to the dairy and to the salesman, especially the latter Each new customer means an increase in his salary Naturally, his efforts will go, first, to the securing o new business and, second, to the retaining of all ol business.

The dairy profits, in that their payroll contains onl what money has been earned, and the more they pa through this medium, the more they receive. Hence, yo have the employer and the employee working hand i hand to gain the goal of larger volume and greate profits.

⁂

TO MEMBERS OF THE NATIONAL DAIRY ASSOCIATION.

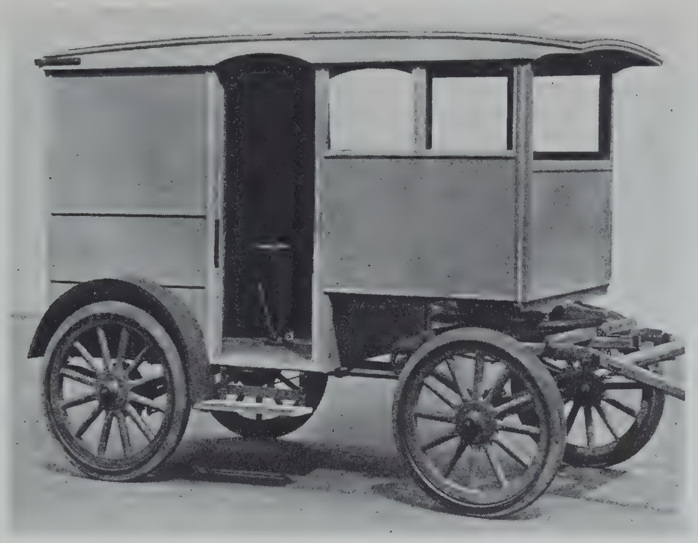
Chicago, Ill., Nov. 1, 1926.

In conformity with the by-laws, a call is hereby issue for the annual meeting of the association for Frida December 3, 1926, at 10 a. m., at the offices of the ass ciation as required by the by-laws, when adjournmen will be immediately taken and the meeting resumed a the parlors of the Auditorium Hotel, Michigan Avenu and Congress St., Chicago, where members are expecte to report directly.

As a leader in an industry that has such a vital bea ing upon successful agriculture, and as a member of a association that is earnestly striving to advance the i terests of the great dairy industry, it is sincerely hope that you will be willing to give of your time to atten the meeting for your own advantage as well as for th good of a splendid work that needs your counsel. Whi it is customary to ask for proxies for such meetings, would be better if it were not so. This year it is pa ticularly important that all members attend who can po sibly arrange it, and take up their responsibilities membership. Matters affecting the future life and us fulness of your associaton will be acted upon at th meeting.

Do not treat this meeting as a perfunctory matte Rather make it one of personal responsibility and give your earnest attention. Let your office know that y will be on hand.

Yours very truly,
CHARLES L. HILL, Pres.



A New Step Forward

Stimulating Milk Sales In Stores

What Kind of Dealer Helps in the Milk Trade? Brand Advertising Should Have a Store Tieup Always

By E. J. CLARY*

AN INCREASING number of dairymen doing regional business through retail outlets are engaging in billboard and other forms of local advertising. They are telling the people to buy and ask for their brand of milk and cream but are doing very little to establish their agencies in the public mind.

This means that there is a decided gap in the merchandising scheme and one that costs the dealer money in the long run.

An increasing number of milk dealers, in seeking retail outlets and advertising their brands locally, are looking into the matter of dealer helps in order to get the full benefit of their advertising.

Where exclusive milk agencies exist, it is not difficult to get the co-operation of the retail dealer though in other cases, it takes some sales promotion work.

Very few delicatessen stores, groceries and confectioneries ever consider the advisability of playing up their milk service through window set, counter cards or streamers and perhaps there is some blame to be laid at the door of the dairyman.

The whole thing may be summed up thus:

Make every retail outlet you have familiar to the buying public so they will know where your brand can be purchased.''

That is why the dealer help idea, which has languished in the milk trade, generally speaking, is of interest to the trade just now.

Get Retailer's Co-operation.

Many of the larger dairies are well equipped to service the retailer of their milk in the way of store signs and window setups and there is no reason why the smaller regional dealer cannot do something along this line to his own advantage.

I find in the East the following forms of dealer helps in use at present:

a. Window displays.
b. Window cards.
c. Store streamers.
d. Counter cards.
e. Store signs.

For the most part, these helps are being given free to the retailer by the milk plant when, as a matter of fact, a better purpose would be served if a nominal charge were made.

Route men are seldom competent nor have they the time to service the retailers they serve. The dairyman would unquestionably find the employment of a sales promotion man to work up dealer interest in milk displays a good paying investment. While the larger dairies do this, very few of the smaller ones have seen fit to do so. Such a man could contact the most important retailers at regular intervals with helps and suggestions that would bring direct returns to the milk plant itself.

It has been found that helps sent to retailers unordered and free are seldom put to good use or any use. When the stuff is sold to the retailer he places more value on it and is more apt to use it promptly and effectively.

Don't Know What Brand.

In buying bottled milk at the corner, the housewife as a rule doesn't question the brand, if she even notices what brand she is getting. ''A good many of my customers seem to think,'' said a chain store delicatessen manager to me recently, ''that we bottle our own milk. It shows they don't even read the cap which bears the imprint of one of the best known milk plants in New York.

''I could change brands overnight and never hear of it from my trade.'' This makes the use of suitable dealer helps by the trade of great importance.

Dealer helps of one kind or another serve to establish the retail store using them for the advertised brand; it completes the chain of advertising from billboard and newspaper to consumer, pointing to the place where the advertised goods can be purchased.

In addition, dairymen are engaging in more direct mail work to back up the co-operation secured through their retailers. I recently saw a form letter sent out by a milk plant in New York which listed 27 retailers handling their brand in a single neighborhood and urging the householder to see them and trade with them.

A grocer's show window certainly is worth a lot to the milk plant whose brand he carries regularly but how often do you see a milk window? Very rarely.

When a brand is considerably above standard and is maintained at that point, the plant has a powerful advertising force to bear on the consumer and in no way can it be used to better advantage than through the retail channels.

''What can we do in the way of dealer helps?'' the plant manager asks.

Milk Selling Displays.

Milk loans itself to attractive though inexpensiv window setups of cardboard.

Novelty houses have many processes by which exaggerated bottles with advertising on them can be displayed in the store.

Streamers are readily used by retailers if they ar attractively gotten up.

Counter cards and wall signs, if hung by the plan agent, will usually be permitted to hang there indefin itely.

The large dairies, we know, furnish these helps i quantity but the smaller plants have not gone into the to the extent that they should do so.

It is very much, after all, like merchandising ic cream. The ice cream people are pointing the way f the milk plant in regard to dealer help service. Yo know, when you step into the average drug store, wh brand of ice cream you are going to get or are gettin in your sundae. The wall signs and counter sig tell you.

Special outdoor sign propositions are usually t costly for the milk plant to offer. The milk sales volu in the average retail store isn't heavy enough to wa rant them.

The fact that some of the larger milk dealers ha made special outdoor sign offers to their retailers doesn mean that it would be profitable to the little fellow.

To build up an over-the-counter trade, the plant h to engage in some sort of promotion along these line

Advertising in local press and on billboards alo won't do it. You have to ''label'' your stores.

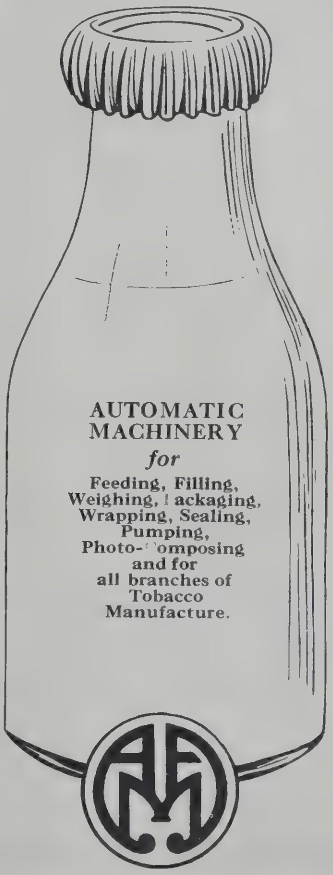
AMF Automatic Milk Bottle Sealing Machine, with Milwaukee Filler.

Seal for Safety

THE new and better way of capping milk bottles is by means of the Westlake one-piece, non-resealable Sanative Seal, as applied by the AMF Automatic Milk Bottle Sealing Machine. This is the most completely protective bottle seal ever devised. It cannot be knocked off or jarred loose in handling, and perfectly guards the customer against contamination from unclean hands, dirty ice, or animals. It requires no wires or other equipment of any kind to keep it in place.

This seal is air-tight and waterproof. A simple turning and lifting movement is sufficient to remove it with ease. It can then be replaced as a dust cover, but cannot be used again as a seal. Write for descriptive bulletin and prices.



AUTOMATIC
MACHINERY

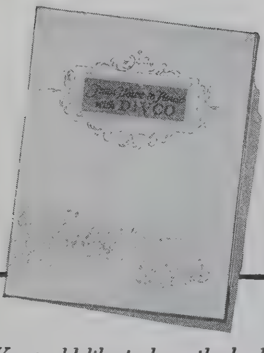
Gasoline Driven — Not Electric

From House to House with Divco

The milk man of the very near future will go from house to house with Divco. Exhaustive tests in actual service prove that. For Divco, the only gasoline vehicle designed purely for milk delivery service, cuts delivery costs, combines three average routes into two, expands the delivery possibilities of the driver and carries as much milk as any man can deliver.

Write for the booklet which tells all about Divco. It not only describes the vehicle fully, but is complete with operating tables which show the big savings effected in the services of large milk dealers.



We would like to have the book, "From House to House with Divco."

We operate ____ milk wagons at present.

Milk Distribution Business Growing In Importance

New Orleans, the Financial and Manufacturing City of the South, Appreciates Its Milk Bottling Industry

By H. VAN R. CHASE*

CITIES like people are judged by the company they keep. Some always are on edge to learn how they can improve themselves. They are progressive and fighting for new methods of building up larger and greater communities. They are quick to take advantage of opportunity as it presents itself, to keep abreast of the age. Whereas, on the other hand, is quite a different class that is content to stand idly by and wait until fortune voluntarily smiles upon them.

New Orleans is firmly intrenched in the first category, It is a city that is growing rapidly but steadily, consolidating its advances as quickly as it makes them. Every part of its life is affected, civic, commercial, industrial and financial.

A glance at the docket of public and private undertakings that are projected for the city—$246,037,901 of them will serve to convince the reader that New Orleans is alive to what the future has in store for it and is not satisfied to rest quietly upon the advantages it presently enjoys.

But all this goes into the story of the city's expansion. New Orleans is the nation's second port. It is the financial center of the South also. Bank debits for the year 1925 amounted to $4,289,342,000, a gain of $333,000,000 over 1924. Its bank resources are in excess of $330,000,000. It has the only bank in the South with resources above $100,000,000.

As the nation's second port and as a distribution point second to none, the splendid facilities offered by 13,000 miles of navigable waterways via ten major trunk line railroads and ninety steamship lines give New Orleans direct connection with all the important markets of the world.

Industrially, New Orleans is making the country sit up and take notice. It now manufactures 900 different articles in over 1,200 large plants. The New Orleans Association of Commerce Industrial bureau has inaugurated a big program of industrial development that calls for an active compaign to attract great national industries to the city in increased volume, because it deems such to form a backbone for the prosperity and general gain of the community.

While New Orleans is forging rapidly ahead, the areas surrounding it are reflecting its growth. On the Gulf coast, the marks of progress are very evident. This stretch of beautiful coastline on the shores of Mississippi Sound, has come to be known as the "American Riviera." Three great hotel projects are included in the $50,000,000 that is being spent for improvements and development.

An important factor in the development of the city has been good roads. The old Spanish Trail passes through New Orleans on the route from St. Augustine, Fla., to San Diego, Calif. It is a fine, smooth surfaced highway with good connections at its eastern and western outlet from New Orleans. The Jefferson highway gives tourists who travel by automobile a splendid international road from New Orleans to Winnipeg, Canada.

"The future of the South is guided by two great industries," says Roger W. Babson, noted business forecaster and statistician. "The first is 'the Motor Industry,' and the last 'the going away winters industry'."

In other words, Mr. Babson foresees the exodus from the bitter climes of the North to the moderately temperatured southern playgrounds when "Old Man" Winter sends his icy blasts upon them.

Automobiles, to a large extent, will be the mode of transportation. New Orleans, which has established a name and reputation throughout the country as a year-round capital for the transaction of business or the full indulgence in pleasure will be the natural mecca for two reasons—one, because of the magnificents system of highways giving entrance to it, and two, because of multiple advantages it enjoys.

New Orleans consumes on an average of 26,000 gallons of milk a day, representing an annual outlay of approximately $5,276,400 for this nourishing food drink.

While the ordinary observer would consider the figures, on their face, of large proportions, it is the opinion of George A. Villere, president of the Cloverland Dairy Products Co., Inc., that there is still plenty of room for greater education of the population to the habit of drinking milk.

He supports this theory by pointing out that New Orleans is a city of some 425,000 souls—nearly a half a million—with a mere 26,000 gallons of milk, which should be the universal draught, sufficing for its needs. In other words, a gallon for every sixteen of the inhabitants, seemingly a poor proportion.

Mr. Villere is the active head of the largest milk distributing plant in New Orleans, or the surrounding country. His company handles daily 12,000 gallons of fresh milk—slightly less than half of the total consumption for the city per day. Retail prices here are 8c per pint and 14c a quart. The plant, itself, is the last word in modern milk depots, complete in every detail and equipped to the last notch for the sanitary pasteurization and distribution of milk.

Three large assembling stations, located in the best dairy farming districts near the city, form the points of contact between the producer and the distributor. Farmers bring the milk to these stations, in this case at Tangipahoa and Slaughter, La., and Wesson, Miss., where it is weighed and then promptly placed under refrigeration that keeps it at a temperature of from 34 to 36 degrees.

Glass-lined and refrigerated tank cars of capacity of 2,000 to 3,000 gallons then pick up this milk at the same temperature under which it has been kept and haul it into the main plant here. It is then pumped from the cars into a weighing bin—checking the weight against the sub-station report—to establish the price due the producer. The latter usually receives about 28 cents per gallon for product on the basis of "four per cent" milk. If it is classed higher, the price rises accordingly. The Cloverland Company handles about four of these cars per day.

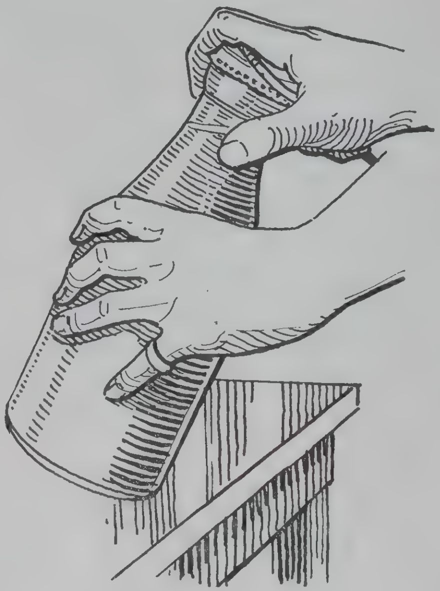
After weighing, the product is pumped to the top floor of the plant into glass-lined tanks of 4,000 gallons

---

* General manager, New Orleans Association of Commerce.

THE
DACRO
METAL CAP

Here at last is the perfect package of Milk or Cream, pure and sweet pasteurized IN the bottle! Made possible by a mechanically perfect closure.



Pure, sweet MILK—delivered under hermetic seal to the home. Handy openers supplied at small cost.

The Dacro Metal Crown—This remarkable cap is made on exactly the same principle as the famous Crown Cork which revolutionized the bottled beverage industry. The Dacro Crown is a hermetic seal. It automatically locks under the glass rim of the bottle. It is scientifically a perfect closure. Sealed with the Dacro Crown, Milk or Cream can be pasteurized in the bottle, an exclusive advantage of this seal. The Dacro Crown covers and protects the pouring lip. It KEEPS clean milk clean! No danger of contamination or tampering with pure contents. And the Dacro Crown can be replaced for temporary covering and seal after opening bottle.

PASTEURIZE YOUR MILK
IN-THE-BOTTLE

THE
Crown Cork & Seal Co.
BALTIMORE, U. S. A.

Inventors and originators of the famous "Crown Cork"

capacity. It is then subjected to 145 degrees F. of hea a part of the pasteurization process. After boiling fo the right length of time, it is then sent through a serie of coils and pipes, at varying degrees of temperature un til it is restored to the original 34 to 36 degrees. It in the meantime standardized into four per cent mill which is a slightly greater percentage than local healt board regulations require.

The pasteurized milk then flows into cooled rese voirs from which it is automatically bottled and cappe Between thirty and thirty-five thousand bottles are use daily. The bottles and the wooden containers used b the distributing forces are thoroughly sterilized ever time they return to the plant and before they are refille

The company maintains a fleet of 86 wagons, eac wagon responsible for an allotted portion of the cit and is not permitted to accept orders outside of its r spective district. Besides it holds some fifteen wagon aside to supply groceries and drug stores and six add tional vehicles to look after the school trade, all in th day time.

From surplus supplies of milk, the Cloverland Con pany manufactures cream cheese, condensed milk an ice cream concentrate, it having a large separate trac in these commodities.

The employed help in the plant proper, including th delivery men, are outfitted in white dungaree uniform that they may change as often as they like.

A demonstration lunch room is located in the buil ing where clubs and organizations may hold forth an listen to lectures on milk while watching the operation the plant through large glass windows. The building the picture of sanitation. All its walls are finished white, glazed tile, making them easily cleanable.

The arrangement and organization of the Cloverlan plant is one to marvel at. It is built so as to permit do ble or triple expansion of capacity without interruptio of business or the usual delays invoked by the proce of acquiring additional property. It has a circulatin air-cooled system throughout; manufactures its own ic has its own emergency power plant, in addition to thr separate power lines of the local public utilities con pany serving it; builds its own wagons, has its ow paint and blacksmith shops; has a large, well clean and kept stable, housing 192 head of mules; mixes its own feed for them, provides them a playground and ve erinary hospital; has spur track facilities and a 20,0 gallon water tank, shaped like a milk bottle, that ca be seen for miles around, the storage water coming fro its own well driven 850 feet into the ground.

Mr. Villere thinks, with all this, that the milk indu try could stand much greater development. He believes the field is still a virgin one and the opportunities ma fold. The "man on the land," or the dairy farm, while being amply repaid for the state of efficiency e has now reached, could be educated and encouraged o broaden his activities, at the same time reducing is expenses, and pocketing the difference. All of this would lead to a more flourishing and affluent condition among the farmers.

Milk Temperature Held Within 1° F. Here

Illustration shows two Burrell Simplex Spray Pasteurizing Vats, in creamery of United Co-operative Society, Maynard, Mass., equipped with:

—American (formerly Honeco) Steam Operated Controllers (marked 2), which automatically hold milk at a temperature of 142° F.

—An American (formerly Columbia) Recording Thermometer (3), which gives a written record of temperature maintained, together with the time inspections were made.

—An American (formerly Honeco) Self-operated Controller (4), to control temperature of the water used for heating milk in the vats.

With this equipment the temperature of the milk is held within 1° F., plus or minus, without the use of air operated controllers. Thus, there is no danger of the milk taking on a cooked flavor or of losing the cream line.

These instruments not only insure perfect sterilization, but speed up production and lower operating cost. Our engineers have made a careful study of the milk industry and may be able to give you some valuable suggestions without any obligation on your part.

Fluid Milk Market Report for United States for Oct., 192

By Bureau of Agricultural Economics, Market News Service, United States Department of Agriculture.

Table I—Producers' Prices for Standard Grade Milk Testing 3.5% Butterfat, Delivered F. O. B. Local Shippin Point or Country Plant.

Prices which appear in this report are secured through the co-operaton of milk distributors, producers' association and municipal officers. Dealers' buying prices unless otherwise indicated, represent prices applying to all milk delivere by producers. For cities where a "surplus plan" is in effect, the prices reported in table III are for "basic" quantitie All per cwt. buying prices have been converted to a 3.5% butterfat basis for comparative purposes.

Sections	Range of October Prices		Prices Compared for Same Markets			
	Number Local Markets	Prices per Hundredweight	Number Local Markets	1926 Average for October	1926 Average for September	1925 Average for Octobe
New England	9	$2.95–$3.82	9	$3.44	$3.44	$3.48
Middle Atlantic	13	2.30– 3.17	13	2.83	2.72	2.67
E. North Central	24	1.89– 3.13	24	2.50	2.48	2.52
W. North Central	18	1.66– 2.75	16	2.22	2.22	2.24
South Atlantic	14	2.80– 5.81	13	3.87	3.75	3.71
E. South Central	4	1.83– 2.75	4	2.39	2.26	2.64
W. South Central	7	1.58– 3.30	7	2.56	2.53	2.86
Mountain	6	1.75– 3.20	6	2.31	2.30	2.57
Pacific	8	1.95– 3.06	8	2.63	2.63	2.79
United States	103	1.58– 5.81	100	2.76	2.72	2.81

Above prices include "basic" prices where a surplus plan or pooling plan is in effect. Cities where prices are base upon current butter quotations not included.

Table II—Prices for Special Grades of Milk and Certain Milk Products.

The following table shows the wholesale and retail prices reported for "special" and "certified" milk and certain oth products delivered at wholesale buyers' places of business and at the home of retail customers.

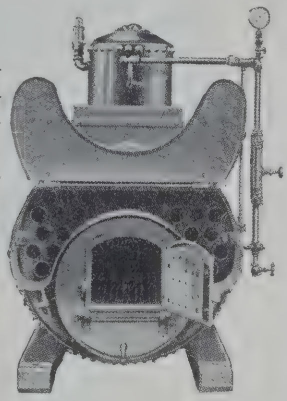
Leffel CREAMERY BOILERS

Save Time Labor Fuel

Surprising economy can be effected by operating Leffel Creamery Boilers in your Plant. They give more power, use less fuel, are easy to clean—and require little attention.

The illustration shows how easy it is to reach tubes, fire box and water chambers.



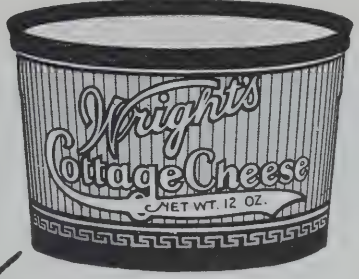
They come complete with all fittings and mounted on heavy wooden skids. Whether your plant is large or small there is a Leffel Boiler that will save money for you.

Sizes from 6 to 150 H.P. Every size fully guaranteed.

Meet all state boiler requirements.

Write for detailed information and prices.

The James Leffel & Co. BOX 330 SPRINGFIELD, OHIO, U. S. A.



The package that increases sales volume with less selling effort. Used by leading milk dealers for longer than 15 years.

Made of snow white paper. Waxed. Keeps the cheese fresh and clean. Your name and brand attractively printed on the package and lid in one or more colors. Send for samples.

Increase Your Sales
BY USING A
"Cream Line" Pasteurizer

Every user of a "Cream Line" Pasteurizer has increased his sales at least fifty per cent in less than a year after installation of our equipment. Many have changed from raw to pasteurized milk without their customers knowing of the change.

There must be Good Reason for this. It will pay you to investigate.

(B) Effective September 16 price to producers will increase 35 cents and to consumer 1 cent per quart.

Novoid Corkboard Insulation

"The Choice of Careful Buyers"

Buy Novoid Corkboard for Your Next Job—

We state it as our honest opinion that NOVOID CORKBOARD is of finer quality, and hence of greater value, than any other corkboard obtainable. And this belief is shared by a great many users of insulation the country over, evidenced by testimonial after testimonial that have come to us extolling the merits of NOVOID CORKBOARD in actual service.

Because of the six basic principles of manufacture employed, NOVOID CORKBOARD gained its following rapidly. Its superiority was instantly recognized, and the standard originally set for it has never varied except in improvement.

Buy NOVOID CORKBOARD for your next insulation job with absolute confidence that its high quality and reasonable price make it, in fact, the choice of wise and careful buyers.

MEET MR. PUBLIC AND FAMILY.

Mr. Public and his family are folks you should know.

He is your neighbor and your neighbor's neighbor. He sits at the dinner table and sees his youngsters grow into manhood and womanhood with mingled pride and anxiety as to their future.

Mrs. Public watches over the household day by day. Hers is the endless duty of keeping Mr. Public in good health and a cheerful frame of mind for his daily tasks. And she must see that Johnny and Mary are given the basic training in health-building habits to make their lives both pleasant and useful.

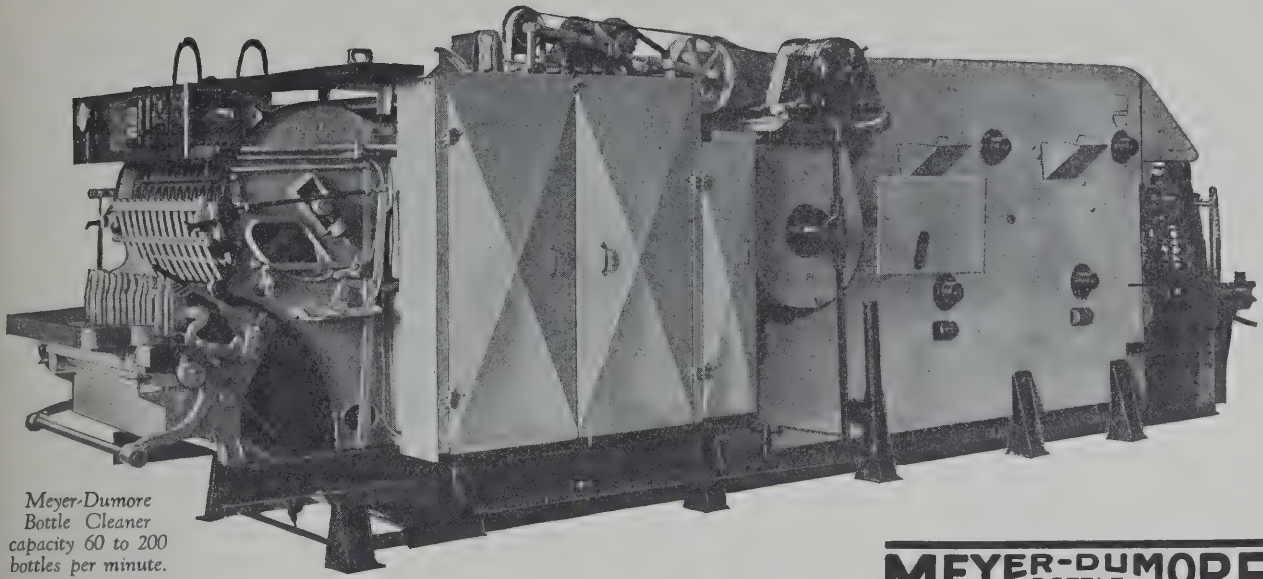
Mrs. Public knows today that she is giving more consideration than ever before to the health of her family. She is being educated by constant reiteration in newspapers, magazines and her social group to the idea that health is, after all, priceless and a jewel to be carefully guarded. She is on the alert for ideas and suggestions.

This little household, in ever increasing amount, is being bombarded on every side by those who seek to direct appetites and habits of living in a commercially profi direction.

Mrs. Public sees so many self-labeled "health cures' "panaceas" that she becomes confused and takes the conservative course of discrediting all of them. She k that she can rely upon impartial authority. So she ru home economics and nutrition schools, reads their wr and watches their demonstrations with eager eyes. S knows that these people are dependable. She knows science and the educational world will tell her, as nea they know, the real truths.

The dairy industry has studiously avoided this ba at Mrs. Public's backdoor. It has placed dairy produ their proper relationship to the right foods for her The result is an increasing welcome in her home an favorable introduction of these products in a balanced program by the very authorities on whom she depends.

So long as each branch of the dairy industry con this course, it will find a ready acceptance of its pr from Mr. and Mrs. Public and their entire family.— Council News.



Meyer-Dumore Bottle Cleaner capacity 60 to 200 bottles per minute.

MEYER-DUMORE BOTTLE CLEANER

What the Dumore means to you!

YOU, as a progressive dairyman, demand dependable bottle-cleaning service day after day, regardless of operating conditions. You cannot afford to employ faulty, inefficient, incapable machinery anywhere in your plant.

Are you sure that the bottle-cleaning equipment you now employ, or are intending to install, will meet every demand you place upon it.

The Meyer-Dumore Bottle Cleaner is worthy of your most careful consideration. As a highly developed piece of machinery for the purpose of producing *absolutely bacteriologically clean* bottles, it is without equal on the market today.

The dependability of its performance is your guarantee of success. Over a thousand Dumores throughout the world are delivering millions of clean bottles every day. The plants operating these Dumores have come to regard this wonderful machine as a tremendously important factor in the successful operation of their business.

Rely upon the Dumore system of soaking, washing, brushing and rebrushing, rinsing and rerinsing, to give you a steady supply of clean, pure bottles at the lowest possible operating cost. Correspondence with us will give our highly developed engineering department an opportunity to explain to you the many advantages of the Dumore. The details mean money to you. Write today.

MAKING THE GAME OF DAIRY HEALTH INTERESTING TO THE "POOR LITTLE RICH KIDDIES" IN SCHOOL.

(Continued from page 28)

picture was furnished by the different business firms of the city.

Various methods were used to keep up the interest of the Health Game Contest. Some rooms would elect two captains and choose sides, and there would be a rivalry to see which side would get the most points in the game.

You will note that we called this a health game contest. Make a game out of it, let the children play. Big folks like some kind of play as a change from the grind of business, just as you can interest the children by a change from their regular studies.

One of the best games played to keep interest in the Health Game Contest was "The Bank of Health," a story of which appeared in the December issue of The Milk Dealer. Miss Reed of the Horace Mann school was the originator of this game, and it worked so well that I shall outline it here again.

The manual training department built a box in the shape of the front of a building. This they painted, and on the front was the letters, "The Bank of Health." Rules were adopted and credits were given for following the various health rules, and drinking milk.

The teacher was chosen president of the bank, and the cashier and other officers were chosen from among the students.

Deposit slips were printed, with a row of figures on each edge. About once a week these slips would be passed out to the children, who would fill in their names and dates, and their deposit slips as to debits and credits were checked and then deposited in the bank.

If they had drunk milk, for instance, the credit side of the slip was punched so many points, if they had failed to drink their milk, the debit side was punched; all of the rules for health were treated the same way.

At the end of a period the bank would be opened and balanced, and, needless to say, but few were in the red, the figures thus obtained, were used in the final score of the health game contest.

Another game played with success, explained by Mr. Corson, was to choose up sides, in each room, with a captain for each side, and every few days the captains would check the points for their side, and the winning side would get to color a block in the milk castle, which was being built.

He told of another feature to stimulate interest:

This was a series plays called, "The Milk Fairies." Each of the intermediate schools drilled a bunch of children for this play and each school put it on three times; twice for the children of the grade schools, and one night performance for the parents of that neighborhood. By the time this series was finished it had been put on fifteen times and every school child had seen it, as well as a great many parents.

The interest created by this contest and series of plays was such that the retail division of the chamber of commerce helped put on a health week and May day parade.

During the health week stores decorated windows on health, and May day there was a large parade of decorated floats, on which were the different characters, in costume, that were in the Milk Fairy play, with bands, children marching, and floats by the baby camp and many others.

Now the question is, Does it pay? Mr. Corson outlined some of the results:

In 1924 the city health department showed a consumption of milk, in the city, of a little over a half pint per person per day, and in July of this year Dr. D. H. Cooper, city physician, found from a survey that the consumption of milk in the city was a small fraction under a pint per person per day.

The report of Miss Genevieve Lill, supervisor of health of the schools, shows that in January, 1924, there were twenty-three per cent of the pupils in the elementary schools who were more than ten per cent underweight, and in May, 1925, this had been reduced to twelve per cent.

This year the health work will have a regular place in the school curriculum.

Mr. Corson received a great many letters from h
little friends, the children, and he quotes a part of or
which was received at the close of the contest:

Wichita, Kansas, June 3, 1926.

Dear Mr. Corson:

The health game contest helped very, very much. M
mother said she was glad that the health cards were give
to every child, because I did not like milk at first but whe
I found out the room who had the most points gets a pictur
my mother said I had better drink milk, if I wanted my roo
at school to get the picture. So I began to drink milk
every meal, etc.

(Signed) LEONA ASHWORTH.

"Put the message to the children and it will get t
the parents," is the advice of this wise merchandiser
milk, the friend of the "poor little rich kiddies."

BEGIN SOUND BODIES IN BABYHOOD, WOMEN ADVISED BY EXPERT.

"Are you in the pink of perfection?" asks Els
Stark, nutrition specialist for the National Dairy Cou
cil, who believes that the time to begin to build a soun
healthy body is in babyhood.

Many women put food which is intended for grow
ups into a baby's stomach and expect the baby to gro
into a strong and healthy boy or girl, she adds. Heal
starts right in the mother's arms. Exercise, the prop
diet and keeping the baby clean and of proper weig
will reward every mother with a handsome boy
grown-up girl who will be surprised to find she does n
need cosmetics and other artificial means of being beau-
ful and healthy.

"Doctors can tell your age by looking at you," sa
Miss Stark, "because your body and its care are reflect
at once and they know that proper foods, plenty of exe-
cise, sleep and a clean body will add many years to yo
life, as well as make you truly beautiful from the insi
out and enable you to enjoy perfect health."

However, if you find you have neglected some
these things it is not too late to begin. Miss Sta
suggests a few simple steps which may help you rega
true beauty and health in your own home and witho
cost to you. Here is a message of real cosmetics with
artificiality thrown out.

"If you want my beauty secrets let me suggest the
beauty products," she says. "Open up Nature's va-
ity case—here are creamy carrots—your lipstick!—o
make your lips red—the kind that won't come off. He
behold the apple's blush: rouge for your cheeks, befe
you go to bed. Complexion cream of spinach or of
cereals smooths the skin and keeps away blemishs.
Look, here are hills to climb and make your flesh fm
and fresh air rays to invigorate the skin. Milk mas
sparkling eyes! Open all Nature's vanity case—he
recipes all arranged waiting to serve you.

"Nature always intended her girls to be beautil.
She even prepared these unsurpassable formulas for yu.
She sits back shyly smiling to see you girls rushig
round agitatedly, looking for hidden beauty reciþs,
while she throws the fruit at your feet, lays green g-
etables upon your table, pours fresh air about you.

"Run, scamper, pick them up! Fill your dressig
table with Nature's products—for health and beay.
Matchless beauty shines with radiating, ruddy heah.
Eat green vegetables and fruit, drink milk and plentof
water, exercise in the fresh air, sleep eight hour a
night—and Nature defies anyone to match the beaty
of your health!"

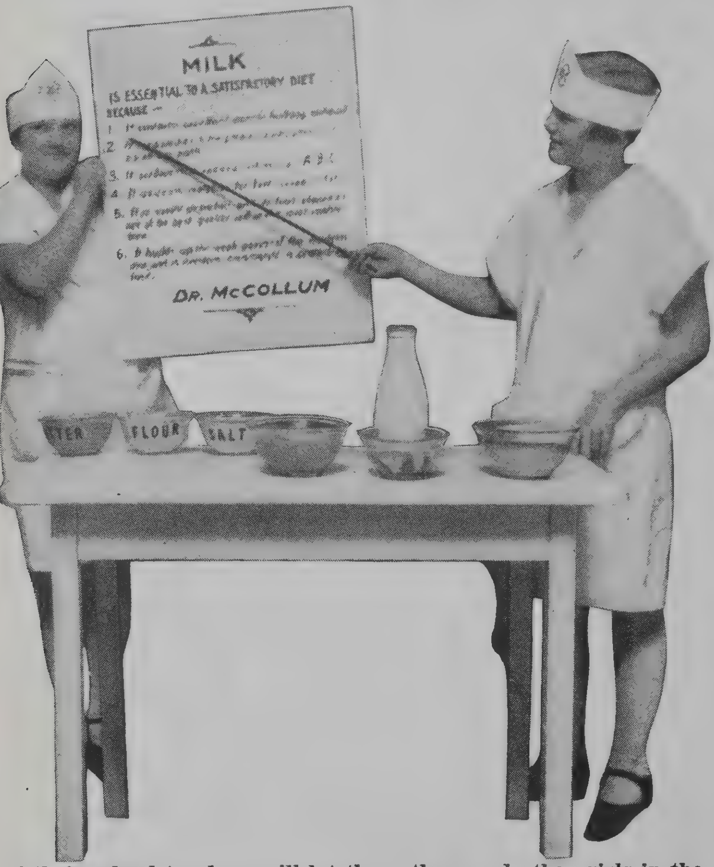
Dairy Leaders to Gather in Chicago

Annual Meetings of Several of the Nation's Dairy Organizations to be Held in the Windy City Nov. 30 and Dec. 1, 2 and 3

FOUR big days chock full of dairy meetings will draw leaders of the industry toward Chicago November 30, December 1, 2 and 3.

Beginning with the annual meeting of the American Association of Creamery Butter Manufacturers November 30, a day will be devoted to each of the four national dairy organizations, including the American Dairy Federation on December 1, the National Dairy Council on the 2nd and the National Dairy Association December 3. Letters from all parts of the country indicate that there will be a record attendance for these annual meetings and those in charge of arrangements assure us that the biggest array of speakers they have ever had for an annual meeting will be in Chicago during this big week.

In addition to business reports of all four organizations and election of officers, the plans for the uniting of branches of the dairy industry into a concerted campaign to increase the consumption of dairy products will be the principal aim of each of these four meetings.



If their school teachers will let them, these and other girls in the Iowa Girls' Club demonstrating team will be at the dairy council annual meeting. This and other treats are promised those who attend the December 2nd meeting in Chicago.

"I am not prepared to announce our full program as yet," stated E. M. Bailey, president of the American Dairy Federation, who called a preliminary conference in Chicago November 4. "Suffice it to say that if our present plans carry we will have speakers on our program that will draw the industry from coast to coast and it will be a program such as the American Dairy Federation has never had before at its annual meeting. Watch the daily papers for announcements later."

In connection with the annual meeting of the National Dairy Council some live features are being planned instead of the ordinary dry business sessions which so many associations are apt to have for an annual meeting. Demonstrations, plays, stories and short talks by those directing the dairy council work will make the program interesting throughout the third day of the meetings.

It is planned to have special demonstrations by state winners in the boys' and girls' "Achievement Day" from Iowa show the people in the annual meeting just how they are using dairy council material in their organization, which is part of the 600,000 boys and girls 4-H clubs throughout the country.

Reports of officers of the dairy council will indicate a steady growth in the council organization, with the addition of one new council unit since its last meeting this being in the Cincinnati territory, and plans for tw new councils being rapidly completed. A steady growth in the personnel of the organization and its influence wil be shown in a summary report at 10 o'clock Thursday Dec. 2, in the Auditorium Hotel, Chicago.

Following the business session and demonstrations a special luncheon will be served, which is always enjoyed by those who attend the annual meeting. Peopl who expect to attend the dairy council meeting are urge to get in touch with the council and let them know ahea of time how many to plan for.

A comprehensive report will be made as to futur possibilities of the dairy industry at the afternoon session of the dairy council meeting. The industry has no reached a point, this report will show, where it has th good will of leading doctors, scientists and health officers and an opportunity will be presented for the industry to check up on the attitude of these people in th report.

On the fourth day a full report of the National Dair Exposition at Detroit, October 6 to 13, will be given an plans made for the future of the organization, which ha just passed its twentieth milestone.

All in all, it will be a big dairy week in Chicago an all leaders in the dairy industry, whether producers dealers, are urged to attend. A detailed report will a pear in the December issue of The Milk Dealer.

⚜

PURDUE CREAMERY SHORT COURSE.

An eight weeks short course in dairy manufacturin will be offered at Purdue University, beginning Januar 17 and closing March 13. It is advisable that young me who wish to take this course should be at least eightee years of age and should have completed a common scho education or have had practical experience in a dai manufacturing plant.

Instructions will be given in creamery buttermakin factory management, ice cream making, dairy m chanics, testing of milk and cream, pasteurizing, mark milk and soft cheese making. Approximately one-ha of the student's time is spent in the Purdue Universi Creamery where butter and ice cream is made dail All students who complete this course satisfactorily a given a certificate.

For further information regarding this course wri the Dairy Department, Purdue University, W. Lafayet Ind.

Milk in Poetry—Song of Life

British Writer, Much Uninformed, Waxes Jocular Over Milk in Manner That Reminds Us the Dairy Industry Needs a Poet Laureate—and He a Dairy Education

FROM our friends in Great Britain, the source of much good writing and considerable more wit than our Yankee friends think exists there, comes a certain jewel on milk that is worth passing along to our readers while it is warm. It was contributed through our friend, P. B. Tustin of United Dairies, Ltd., London, England, likewise a source of much sparkling dairy thought from the other side of the briny deep.

In this article, which appeared in the London Daily Mail, under the rich and racy headline, "At the Sign of the Blue Moon," appeared a discussion of milk that will make all of us smile and wonder with the writer why there isn't more poetry on milk instead of so much on wine. Of course, we must readily recognize, with the writer of this article, D. B. Wyndham Lewis, that milk is not so good a rhyming word as others, yet there are words that rhyme with the lactic fluid, and there are associated words that can be put in the proper position for rhyme and meter. In other words, this article provokes the thought in our mind that the dairy industry needs a poet, a poet-laureate, so to speak, a sweet singer who will lift his voice and lilt the praises of good old foster mother cow and her gracious offering to mankind.

Milk in poetry? Why not? Milk is one of the most poetical words possible; it is of poetic significance, of poetic psychology, so to speak.

But we are running ahead; let's let Wyndham Lewis tell his own story, as he did in the London Daily Mail, under that romantic title, "At the Sign of the Blue Moon." Here goes, and, as Mr. Tustin would say with Shakespeare, "Lay on, Macduff, and be damned be he who first cries, 'Hold, enough!' "

(However, we'd advise Mr. Lewis to learn more of the beverage of which he attempts to write. There is no better way to learn than to drink it, and, no doubt, he needs it.)

Anyhow, here is what he has to say:

"Ah! . . . . . ."
—Ruskin (Collected Works, Vol. V., chap. 25, p. 19).

For the contemplative there are few walks more rich i
matter for meditation than the walk from St. Clement Dane
to Ludgate at about half an hour after noon. To and fr
bustles the many-coloured crowd. From the Law Court
stream the lawyers, dropping off gorged from their prey fo
a moment and avid of a glass of Chablis. Here, in a compac
bunch in charge of their warder, pass the horn-rimmed inhab
itants of Pompton, N. J., and Calaboosa, Mo., gaping at th
tavern of which Tennyson never wrote and making nasa
noises at the tavern where Dr. Johnson never went. An
here, if one is lucky, one may catch a glimpse of Fabian
slinking from their lair down to the drinking-pool.

It was my fortune recently to perceive through the ope
door of an A.B.C. shop in the quarter one of the wildest
hairiest, and most pimply of these Intellectuals in the act o
drinking. Now there are two beverages with which one com
monly supposes a Fabian must refresh himself; one is th
lukewarm water used for washing up dishes, the other is th
sterilised blood of aged hens. This Fabian was drinkin
neither.

He was lapping Milk.

It was then that I determined indignantly within mysel
to write in reparation a panegyric on Milk, which is a drin
noble, immemorial, and of great honour. Why, even befor
old Noah invented the Sacred Vine men were tippling Milk
It is the first drink of babies and the last drink of agen mer
In the Heroic Age it was freely drunk by swaggering stron
men and offered ritually to the gods. "Here," says the shep
herd Menalcas in the Fifth Ecologue, "here be four altar
two to thee, Daphnis, and two to Apollo; and here every yea
I offer twin cups of foaming new milk"—pocula bina nov
spumantia lacte—"and two bowls of rich olive-oil." Th
would be goats'-milk; a thought too rich, perhaps, too full
bouquet, too obvious to please the palate of a connoisseur i
Milk but good enough for agriculturists. A finer vintag
solaced the sweet poet Herrick, immured in his Devon parso
age and surrounded by roaring rustics:

"The while the conduits of my kine
Run cream, for wine,"

—and in many parts of rural England the kindly and hosp
table custom still lingers of handing the traveller, before th
rook him, a glass of warm new Cow's Milk.

It is true that the poets have rarely sung of Milk, where
masses of them celebrate Wine. But I think that is becau
in England there are so few rhymes to "milk"—bilk, ilk, sil
whilk (either the Scottish word meaning "while" or t

Fiddles or Fortunes

ANTONIO STRADIVARI built the finest violins the world has ever known. These almost priceless instruments, known as "Strads," are now the prized possessions of but few of our greatest musicians. While Stradivari worked for months with painstaking care on one masterpiece, other workmen were turning out cheaper instruments in a day's time. He was ridiculed for his slow, careful work, but answered: "Anyone can make a fiddle, but only Stradivari can build a violin."

Ages have passed since the famous statement of the master violin builder was made, but these ages have made the violins of Stradivari famous, while the fiddles of most of his contemporaries have long since gone into kindling wood.

* * *

The milk industry has for ten years been offered a Sales Plan that has stood and will as long as the industry lasts stand the test of time. Like the Stradivarius violins, the Case Plan has been built with painstaking care to meet the needs of those milk dealers who possess the vision to appreciate it. Not all milk companies are efficient enough to get maximum results, but those who are, get from fifty points to one hundred fifty points increase in their daily load average, and their monthly profits are often equal to or greater than their yearly profits before the Case Plan was adopted.

Many milk companies are still using sales plans that are like cheap fiddles—-either of homemade construction, or bought at a price that admits only mediocre value, and the results secured are generally in direct ratio to the amount of care used in their making.

Mr. Milkdealer—Are you satisfied to "FIDDLE" with your sales problems or do you want the FORTUNES born of a masterpiece?

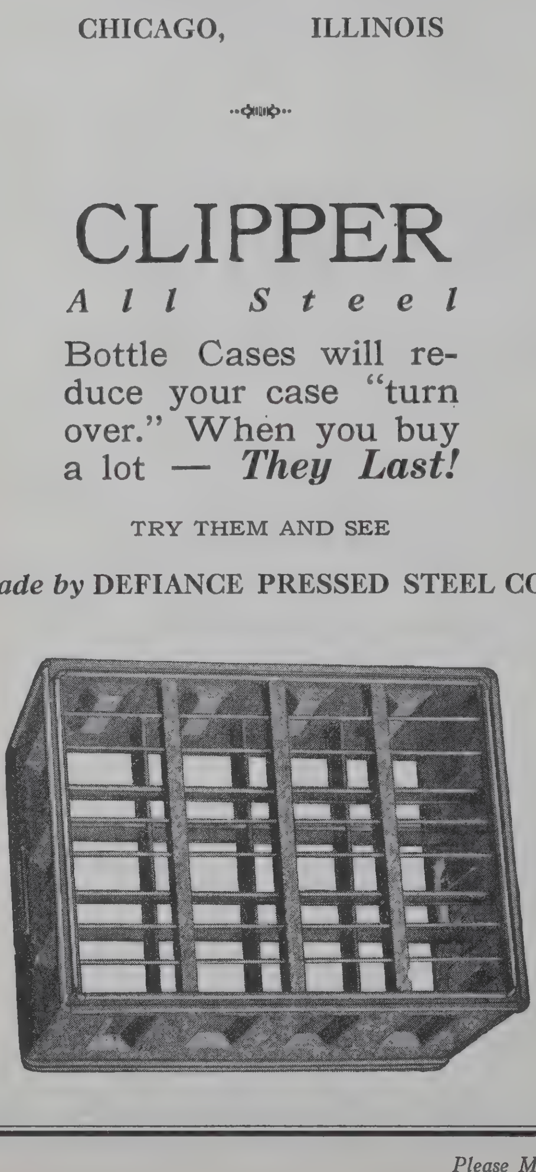
TRY THEM AND SEE

Made by DEFIANCE PRESSED STEEL CO.



Southend word meaning "whelk") are nearly all, and the fir ("bilk") involves introducing a cab into one's poem, whic the Editor of Georgian Poetry cannot abide. Again, few poe have deemed themselves worthy to drink Milk. Byron dran gin, Swinburne bottled ale and burgundy, Burns whisky, Mr Hemans and Cowper weak tea, Addison claret, Milton sma beer, Ben Jonson burnt sack and Canary; and Mr. Boom, notable poet of our own time, will drink anything anybo will pay for, except Milk. I pause here to praise and glori the poet Coleridge, and believe that if the accursed "pers from Porlock" who interrupted him as he was dashing dow "Kubla Khan" had not called we should have had a Rhapso on Milk. Consider the close of that mighty fragment:

"For he on honey-dew hath fed,
And drunk the Milk of Paradise."

This probability seems the more evident if we medita on the three lines:

"A savage place! as holy and enchanted
As e'er beneath a waning moon was haunted
By woman wailing for her demon lover."

It is not too fanciful, I hope, to assume that this was Milkman, for they rise early and are death to women. "G up, Marie, lazy one," sings the divine Ronsard:

"Marie, levez-vous, vous estes paresseuse,
Ja la gaye alouette au ciel a fredonne."

—"already the gay Milkman is tuning his song." That w in springtime in Touraine, where the Milkman leaves his ne before dawn, twittering.

Everything connected with Milk is innocent and good. Christian man cannot consider grass and clover an ideal di, except for Vegetarians; but the Cow does, and devours lar quantities in the scented fields, under the blue sky, with lark singing Tirra-lirra. The lovely Milkmaid,* too, see h she trips afield! "It seems," says Sir Thomas Overbury, "th so sweet a Milk-Press maketh the Milk sweeter or white for never came almond Glove or aromatic Ointment off h Palm to taint it." See, too, the Dairymaid,‡ how sweet s is, among her shining pans! Those happy Milkmen who a already in gaol for relieving their Milk of necessary fats a vested, like her, in white, and sing at the pump.

Out of Milk, I am informed, are made the pretty pap knives which look like ivory, with which I cut with su careful pleasure the pages of Mr. Throstle's last book f Sonnets, but stab and tear with horrible curses at the v and noisome pages of Mr. Howl, that dribbling and glanderl cretin. From Milk, too, is derived Cheese, so multiform a multicoloured, from the suave Norman cheese to P L'Eveque, which Guillaume de Lorris was already singing his Roman de la Rose in the 13th century, to the very gr and terrible cheese of Rocamadour and the Andorran highlands, which is of the Leaping Goat, and the yellow cheese of Cheddar, which is often imported from Osskawoo, Wusk. From Milk, also, comes the Balkan mess cald Yoghourt, which, eaten with powdered sugar, is so delectable and comfortable to men's bodies. Refreshed by his morning bowl of yoghourt the hardy Bulgar goes stamping through the passes, carving old ladies and little dogs into small unequal pieces; on account of which the poet has censoriously observed:

"How beastly vulgar
To be a Bulgar!"

The crux of the eternal Balkan problem, of course, is that obvious ethnologica—

We were, I think, discussing Milk; temperately, reasonably, and (I hope) agreeably to the five principles of the Angelic Doctor when he lectured at the University of Paris—that is to say, with Claritas, or clarity, Brevitas, or brevity, Utilitas, or utility, Suavitas, or sweetness, and Maturitas, or ripening. The vast halls of the University and the Convent of Saint-Jacques were too small to hold the throngs of students flocking to imbibe the Thomist Philosophy from all over Christendom; among them large numbers of our own dear countrymen, lodging in what is still the Rue des Anglais near the Sorbonne: for in the 13th century foreigners were, at intervals, tolerated by the citizens of Paris with something almost approaching fortitude.

The present renaissance in Europe of the Thomist Philosophy to the confusion of the horrible brachycephalous German troglodyte Kant and his hangers-on, is remarkable—

As to Milk, however. It is in its essence and quiddity, its pure natural state, One and Invisible (like the Republic of 1792) and everywhere the same (like the Eternal Verities). Ubi vacca ibi lac—where the Cow is, there is the Milk. By

the Great Tin Churn of Champrosay! the more one meditates on the nature of Milk the more grandiose, transcendental vast, and illimitable appear the avenues of speculation opening on every hand! Milk—

Those who drink the stuff tell me that it is most pleasingly drunk warm and creaming in the pearly hush of a summer dawn near Hartland Point in North Devon. There is no doubt that it is fatal to put it into China tea. Absolutely fatal.

⁂

WASHINGTON DAIRY PLANT OPERATORS' SHORT COURSE.

January 3 to 14, Inclusive.

The short course at the Washington State College of Pullman, Wash., is intended primarily for those who have had experience in plant work and operation and now hold positions of responsibility in dairy plants. The course will consist of both lecture and laboratory work but the emphasis will be placed on subjects of a technica nature and which can best be presented and learned in laboratories, especially planned to give such instruction.

A study of the various dairy products and the factors that determine their quality will constitute the contents of the course. The subject matter will be presented in such a way as to show the application of technica information to practical plant operation, in the handlin and processing of dairy products.

The department of dairy husbandry is especially wel equipped to give such instruction. Twelve separate laboratories in the new dairy manufactures building—Davi S. Troy Hall, are devoted to the giving of instruction i subjects relating to dairy plant operation. Machiner of the latest type and design and of full plant size, fo pasteurization, ice cream making, buttermaking, automatic washing and refrigeration are available for stud and practice. A commercial dairy plant is operated i the laboratories where milk, butter and ice cream for th State College and the city of Pullman are prepared an manufactured.

In addition there are available three separate testin laboratories where the various tests and analyses wi be demonstrated and practiced. A Mojonnier testin machine will also be available for those who desire experience in its operation.

A registration fee of five dollars will be required fo this course, and in addition it is urgently recommende that certain books which will be specified, be purchase by those taking the course.

For additional information write to the Departme of Dairy Husbandry, State College of Washington, Pullman, Washington.

⁂

NEW CUBAN MILK REGULATIONS HELP EQUIPMENT BUSINESS.

At a great many points in Cuba drastic regulations are being formulated for the sale of milk. The old methods that prevailed in the United States years ago must give way in Cuba as they did here. A sanitary handling of milk from the farm to the consumer is the object. Naturally these regulations are developing more than usual interest in modern milk handling equipment, milk bottles and milk dealers' supplies. This is just another indication of the trend in the milk industry in the Latin-American countries.

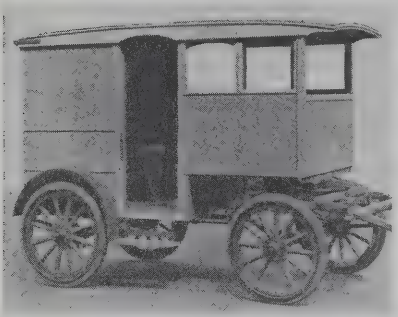
to New Products and New Equipment.

A NEW SEMI-LOW DOWN MILK WAGON.

A new semi-low down milk wagon is being offered by the John Guedelhoefer Wagon Company, Inc., of Indianapolis, Ind., which will create its share of attention in the milk industry.

The frame of the body is of white oak, with plymetl panels. The new wagon is constructed so as to eliminate the commoner necessary wagon repairs, it is claimed by the manufacturer.



Several new features will make this an outstanding wagon in the milk industry. Steps are being featured; fenders made of extra heavy steel, edged with heavy angle iron are a new addition to this wagon, as well as a special automobile foot brake, and a roller bearing fifth wheel. Timken roller bearing axles are being used, which it is claimed require greasing but once a year, and it is further claimed that it is not necessary to renew axles or boxes as is often ordinarily the case, as they will last the life of the wagon. The draft of this wagon is easier on the horse due to the Timken roller bearing axles. The solid pressed-on type of rubber tires it is claimed will outwear three sets of steel tires and a special style wheel is used on the new wagon to eliminate all wagon wheel repairs such as spokes, hubs, rims, setting of wagon tires, etc. The gear is made of hickory with extra heavy springs equipped. Capacity of the job is from 36 to 42 cases.

Literature will be sent to any firm interested in further investigating these new style semi-low down milk wagons.

* * *

OPLER'S AGAIN EXPAND.

E. & A. Opler, Inc., cocoa manufacturers, with headquarters in Chicago, have just completed a transaction whereby it secures large dockage and warehouse facilities in Brooklyn, New York. They have rented a building occupying about 21,000 square feet from the New York Dock Company. This building will be occupied exclusively by them, and will be the firm's headquarters for making Eastern shipments and also for taking care of coastal and export trades. It has complete water as well as rail facilities giving it transportation facilities second to none. This will mean almost immediate delivery to any point in the Eastern section of the country and should be of vast interest to all Eastern buyers.

The building which has heretofore been used for warehousing is being entirely remodeled and made into a wonderful daylight factory. All new machinery is being installed so that the equipment will be the most modern. This plant will be in charge of Miss May Opler who has been associated with her brothers since the early days of the organization and is widely recognized as an expert in the cocoa business.

This makes the second time within two years that E. & A. Opler, Inc., have found it necessary to enlarge their manufacturing and shipping facilities in order to take care of their various branches of business. In a comparatively short time they have become recognized as one of the leading cocoa firms in the United States, mainly because of their close attention to the smallest details of their business.

* * *

PREVENTION OF CORROSION.

Although not in itself a new material, "Krodeproof," manufactured by the Lewis Asphalt Engineering Corp., 30 Church St., New York City, is a new and economical method of applying a well-known material whose value and protective qualities are recognized. Krodeproof is a preventive of corrosion and a new method of applying asphalt as a waterproofing agent. In the manufacture of the product, a carefully selected asphalt is broken into minute particles and dispersed in water, the water acting to suspend the particles to keep them from flowing together and at the same time as a vehicle for spreading the particles. When spread cold on a surface of masonry or steel, the water evaporates and the asphalt particles which were held in suspension flow together and unite. Krodeproof, therefore, does not form a thin fragile skin like paint, but a thick, dense, plastic film of asphalt, exactly as if the asphalt had been applied hot with a mop.

Among its many uses is offered perfect protection against brine drip, acid fumes and corrosive gases generally.

* * *

A NEW MILK DRINK.

Although in use for some time in several Eastern states, Arabian Brand Coffee Syrup, manufactured by D. Abelsen & Son, Providence, R. I., is now being put on the national market. The syrup is made from freshly roasted coffee which is specially selected for flavor, and is highly concentrated.

When mixed with milk, it produces a novel drink with the flavor of coffee which the manufacturers claim will find a wide and popular market. The syrup when once mixed with milk will not go out of suspension and cause sediment on the bottom of the bottle. It needs no shaking before drinking and is said also to keep well after being mixed.

Arabian Brand Coffee Syrup is put up in 12 oz. and 16 oz. bottles for home use which the dealer can also sell to his customers, and in five and ten gallon jugs for milk plant use. The manufacturer offers to send a trial sample to interested milk dealers.

* * *

THE BASE OF GOOD CHOCOLATE FLAVOR.

Contrary to general belief, it is cocoa—not chocolate—that provides the basis for the one flavor in greatest demand.

Cocoa was the invention of C. J. Van Houten of Weesp, Holland, in 1828. Technically, it consists simply of chocolate with the butterfat content reduced from approximately fifty per cent to between eighteen and thirty per cent.

The operations performed by Mr. Van Houten by hand, back in 1828, are nowadays done by machine, of course. Yet, fundamentally, the process is identical to the inventor's.

Theobroma Cocoa, the tree bearing cocoa beans, is very like any other delicate fruit tree. It flourishes in the tropics—grows wild in Africa, Brazil and other parts, but in Java, Venezuela and Ecuador the trees are cultivated and growth is carefully tended. In these latter places, sheltered valleys well watered by tropical rains and brown rivers, are productive of the very finest fruit—cocoa beans that attain the rich, fine flavor so well known to the customer.

In selecting a cocoa for use as a basis for syrup, the fountain manager will secure his desire when he orders a cocoa made from beans unadulterated so far as soda, etc., are concerned and of maximum solubility. If these several features are obtained in the cocoa purchased, it goes without saying that the flavor will be exquisite, the strength unimpaired, and that the working qualities of such cocoa will permit a smoothness and syrup flavor and consistency of the type that will hold old customers and make many new ones.

WHEN IS AN "AUTHORITY?"

By W. F. Schaphorst, M. E.

You yourself are probably an "authority" on som phase of some subject.

If you have a hobby—and we should all have som sort of hobby—you may be an authority on that subjec

However, there are various degrees of authority. hundred years ago James Watt was an authority o steam engineering matters, but if he should come bac to earth today he would have much to learn. Autho ities who died 100 years ago and whose names are r vered now would not be authorities today if they coul learn no more than they knew then.

In the same way authorities of today are mere infan in knowledge or will be so regarded 100 years henc We really know so little that we have no cause f boasting.

There are some people in this world, however, wh are "know-it-alls" and who look into a technical trade publication apparently for the purpose of findi fault rather than to learn something. They find an a ticle that is elementary and is intended mostly for b ginners, and with a gloating "ha ha" the publication thrown aside with the remark, "That paper is no good"

The writer admits that he is writing this largely self-defense because he has frequently been criticis for writing elementary articles and for making mistak There is no question but that I have made mistak some of them seeming very foolish to readers and ve embarrassing to me after they were pointed out to m But then, who HASN'T fallen down? I have fallen mo than once.

The principal function of any serious publication to teach. Every word in the publication from the fi advertisement on the front cover to the last adverti ment on the back cover should be instructive, and it h been my experience that most publications are instr tive. The editorial pages should contain editorial op ions, should contain the results of experiences of reade should contain news items, notices of meetings, notic of new catalogs published by manufacturers, etc. T publishers are doing their very best toward advanci knowledge. Could the scoffer do better, I wonder?

Bearing in mind the fact that future generations wil be amused to some extent at least by our present e-mentary knowledges, how foolish it is for us to pre about our knowledge and how foolish to scoff at te other fellow. Nobody is a real "expert" or "authity," unless, possibly, in an exact science like mathemics. We may think we are authorities but we are nt. Authority is only relative.

The above was inspired by the following whicl I found in the publication Philosophy of Health in wh h the famous Doctor J. H. Tilden of Denver, Colo., wr e as follows:

"If no one is to open his mouth on any subject uil he becomes an expert or recognized as an authorit I fear progress in this world will be at a snail's pace.

"There is not any question but what bigotry—he disposition to assume authority, and to suppress he opinions of others who are novices, so to speak—prevets progress in all branches of learning. Wide-open discsion and free speech is the only door to progress in y educational line."

The right thing for anybody to do when he discors something that he thinks is new and that he feels ill be of value to the world is to write about it and sd the story to the publication covering the subject. Pblications today cover nearly every field.

How to Get Quality Milk

Bacterial and Chemical Tests Valuable in Securing and Maintaining Quality

By N. E. LAZARUS, B. S.*

TO THE purchaser or user, milk is either good or bad. Customers (and especially housewives) base their opinions upon the flavor and odor, depth of the cream line and the visible sediment.

This idea of milk quality may also be expressed in terms of food value, healthfulness, cleanliness, keeping quality.

Milk is so important as a food and affects public health to such a great extent, that it has necessarily been a fertile field of technical research. Consequently, many chemical and bacterial tests have been devised for determining its quality. The four factors of quality can now be easily checked by various simple, well known tests.

The information that is necessary to secure quality milk is:

1. Bacterial condition of the milk as determined by
    (a) Temperature
    (b) The acidity
    (c) The sediment
    (d) Number of bacteria
    (e) Types of bacteria
2. Chemical condition of the milk as determined by
    (a) Butterfat content
    (b) Total solids content
    (c) Freedom from watering or skimming

The control of milk quality logically begins with the raw product. A good raw milk supply will invariably give a good finished product, unless carelessness is shown in plant operation.

In the past, the practice has been to depend solely upon score cards and inspection of dairy farms to determine the sanitary conditions affecting the raw milk supply. While such scoring may give good results from an educational standpoint alone, it will not insure milk of high quality. It often happens that high scoring farms produce poor quality milk.

To obtain good raw milk, it requires a simple system, that can be used as a daily check, if necessary. It is useless to expect the average farmer to produce sweet milk with a low bacteria count regularly, if his place and cattle are inspected and scored only once or twice a year.

Since raw milk varies daily in quality, depending upon climatic conditions and methods of operation, it follows that the milk supply should be frequently checked.

The necessary facts can be obtained easily by any normal person, with average schooling. It merely requires the use of simple standard methods, that are explained in detail in state experiment station bulletins.

Tests for Bacterial Control.

The bacterial condition of the raw milk supply has a direct relation to three factors of quality: Healthfulness, cleanliness and keeping quality. The following tests determined these three factors.

Temperature: Sour milk can be avoided, if the milk is kept at a temperature below 50 degrees F. Since all types of bacteria rapidly increase at higher temperatures, the raw milk supply should be 50 degrees F. or lower when received at the plant. This necessitates the use of a thermometer, and the ideal instrument for this test is a handle top, platform inspection thermometer 18 inches long, with a one degree scale division from 3 to 90 degrees F.

Acidity: The percentage acidity of the milk is an indirect index of quality. Milk with an acidity of .2 per cent is said to be "on the turning point." Acidity is usually produced by lactic acid bacteria and indicates, as a rule, that the milk has been improperly or insufficiently cooled (higher than 50 degrees F.) There are a number of acidity outfits on the market but the type best suited for quick work is the kind that merely requires mixing a certain amount of test solution and milk. If the color remains pink, the acidity of the milk is normal. If the sample turns white, it is too acid.

Sediment: The presence of dirt, manure, cow hair, etc., in raw milk, is evidence of lack of cleanliness, carelessness in handling or both. Examination of such milk usually shows colon and putrefactive types of bacteria. It is just as easy for the farmer to produce clean milk as dirty milk. The sediment test furnishes visual evidence of the lack of care in handling milk. The sediment outfits on the market are designed to make from one to seven tests simultaneously. The degree of cleanliness is determined by comparing the cotton discs with a photographed standard gauge.

Number of bacteria: Bacteria are found everywhere; in the air, soil, etc. They are colorless plant organisms that are invisible to the naked eye. Bacteria require warmth, moisture and a suitable food supply for rapid development; milk furnishing all three, is ideal for their growth. Fortunately, most types of bacteria in milk are not harmful, but as a precautionary measure, health authorities usually set a limit for the number of colonies of bacteria allowable in milk offered for sale. In many cities milk is classified into various grades, upon the assumption that high bacteria counts indicate poor quality milk, while low counts indicate good milk.

For determining the number of bacteria in the raw milk supply, three tests have been devised that give fairly accurate results within a few hours—a necessity for controlling raw milk quality. These tests are the Breed microscopic method, the Frost method and the methylene blue reductase test. The first two tests require the use of a microscope and a trained operator; the last is a method depending upon a change of color, for indication of the number of bacteria. It is easy to use and requires no technical training or skill. For pasteurized milk, the official Petri plate method is recommended. It will necessitate purchasing special apparatus and glassware, and possibly a short training period for the operator, but the results obtained will make it well worth the time and money involved.

Types of bacteria predominating: This is determined by the fermentation or curd test. This test is simple and easy to operate. The outfit required consists of ordinary test tubes, and water at a temperature of 100 degrees F. The test must stand about six hours. The same sample may be used to make a combined fermentation and reductase test.

The condition of curd indicates the type of bacteria predominating.

A jelly like curd, free from whey and watery substances, indicates lactic acid bacteria. This condition is usually due to insufficient cooling.

A curd full of gas and pinholes indicates gas forming

MILWAUKEE, WISCONSIN **WAUKESHA, WISCONSIN**

bacteria, a condition due to manure or dirt pollution.

A curd partly digested or dissolved is characteristic of putrefactive bacteria, usually indicative of improperly cleansed utensils, etc.

Tests for Chemical Control.

The chemical condition of milk is directly related to the food value element of quality and this is determined by the following tests:—

Butterfat test: All raw milk should be bought on a butterfat basis, as it is the important commercial constituent of milk. In recognition of that fact, legal standards have been established for butterfat content by practically all American municipalities and states.

The best known as well as the official butterfat test in the United States is the Babcock test. This requires the use of a centrifugal machine, accurately standardized glassware, heat and sulphuric acid. This test is based on the action of sulphuric acid upon milk solids, whereby the fat particles are liberated. Centrifugal force together with heat completes the separation. The fat is measured directly in standardized glassware.

Total solids by lactometer test: The solids in milk, exclusive of fat, are chiefly casein, albumen, other milk proteins, lactic acid, sugar and mineral salts.

These constituents together with the fat, make milk a most valuable food. Skimming, watering or other tampering, change the proportions of these constituents and thereby affect the food value of milk.

This test is used to determine the weight of a given volume of milk as compared to the same volume of water (specific gravity of milk) and indicates whether the milk has been adulterated by watering or skimming. Milk will vary normally in specific gravity from 1.029 to 1.034. Anything above or below these figures may be assumed to indicate adulteration. Glass instruments known as lactometers have been devised to measure specific gravity. The relative weight of the milk is read from the graduated scale on the stem of the lactometer and this is the specific gravity of the milk.

Tables of figures showing the relations of the lactometer readings, fat content and total solids have been worked out from thousands of chemical analyses. These tables are very reliable and are easily obtained. If, therefore, the lactometer reading and butterfat content are known, these tables will indicate the percentage of solids in the milk.

Even if the raw milk supply is of the highest quality, improper plant operation will quickly decrease its value.

It is necessary that all machinery, apparatus and utensils be thoroughly washed and then sterilized with live steam under low pressure, to keep down bacterial growth. Cans must be washed, sterilized and dried with hot air, otherwise they are a fruitful source of bacterial contamination.

Where the pasteurization process is used, these important facts must be constantly in mind:

1. Pasteurization, to be effective, must destroy all disease germs and reduce to a minimum the number of milk organisms.

2. An expensive pasteurizing outfit becomes nearly useless if

- (a) Employees cut down the holding time.
- (b) The milk is not heated to the proper temperature.
- (c) The outfit is not thoroughly cleaned and sterilized before and after using.

Bacterial control of the operating process by means of the Petri plate method gives a very reliable check for prevention of milk contamination during handling.

The next chapter will point out the proper procedure for securing quality milk from raw supply to finished product.

Important Factors.

Farmers must deliver morning's and night's milk in separate cans.

Morning's milk must not be higher than 60 to 65 degrees F.

Night's milk must not be higher than 50 to 55 degrees F.

As soon as the milk is received, the employee who pours the milk into the receiving vat should run the palm of his hand down the side of each can. If it is warm to the touch, the thermometer should be used to determine its actual temperature.

Once a week, one can each of morning and night milk from every patron's supply should be tested for temperature and a comparative record kept. Each can of milk should be examined daily for off odors before being dumped.

All milk that is too high in temperature or that has an off odor should be rejected. Patrons that are constant offenders should be dropped until they comply with requirements.

Once a week in winter and twice a week in summer, every can of milk received from farmers should be tested for acidity before being poured into the weigh can. Use the instant acidity test method, preparing the test tubes on the previous afternoon. One test tube is required for testing each can of milk. Any can of milk that has too high an acidity should be rejected and the farmer notified immediately.

Once a week, a sediment test should be taken of the total supply of milk delivered by each farmer. This

sample can be taken from the receiving vat or weigh can. If a farmer continues to deliver dirty milk, it should be rejected until clean milk is produced. One seeming objection to this test is the fact that farmers will soon begin to strain their milk at home. The bacteria and fermentation tests will, however, give additional information that will supplement this test.

Twice a week, the test for number of bacteria of all incoming milk should be made. A sample is taken from the weigh can of each patron's milk. Either the Breed microscopic test, or the methylene blue test should be used for this purpose. If a sample of milk is found to be high in bacteria, another test should be made the following day. Farmers should be notified of results and advised to "clean up," with the warning that milk with high counts will be rejected.

Every week a test for types of bacteria should be made. If colon or putrefactive types of bacteria are found, an inspection of the farm from which such milk is received should be made. Milk with these forms of contamination affects the flavor of the finished product and should not be tolerated. They indicate dirty production at the farm, which should be remedied at once.

The entire raw milk supply should be tested for butterfat regularly. Preferably, a sample should be taken daily and this composite sample should be tested at least twice monthly. This is the most satisfactory method of determining the actual butterfat content of the milk that is delivered. Any milk that is below 3.0 per cent butterfat may indicate tampering, and such supply should be carefully watched. Payment for milk on weight and butterfat has proven most satisfactory for both farmer and distributor.

About once every two weeks a lactometer test of

each patron's milk should be made. It will prevent any tendency on the part of the farmer to water or skim the milk.

Dairy Plant Operation.

1. All milk pipes, pumps, valves, vats, pasteurizing outfits, etc., should be thoroughly cleansed with a mild, alkali solution and hot water.
2. The importance of thorough sterilization of all apparatus, machinery and utensils with live steam under moderate pressure for at least five minutes cannot be overestimated.
3. All milk cans should be thoroughly washed, steamed and dried before returning to the farmer.
4. Bottle washing machines should be run at sufficiently high pressure and temperatures to insure proper sterilization of the bottles.
5. Temperature recorders for pasteurizers should be checked daily with an accurate hand thermometer to avoid overheating (cooking) or underheating (insufficient pasteurization). This precaution will help to eliminate poor cream lines.
6. The time of holding milk should be checked once a week if the continuous type of pasteurizer is used. The holding period is an important factor in lowering the number of bacteria.
7. Milk should be cooled at once after pasteurization, to 45 degrees F. or lower, and stored at that temperature or lower. This will prevent high acidity and rapid bacterial increase.

Bacterial Control Check.

In order that no uncertainty should exist as to whether the above instructions are carried out, a test is made of plant operation at least twice a week or oftener as follows:

Sterile bottles are filled with milk at the following points in the plant equipment: (2 samples at each point, marked a and b):

Milk from weigh can or receiving vat.
Milk going into clarifier or filter.
Milk coming out of clarifier or filter.
Milk coming out of heater.
Milk coming out of each holder (if continuous type). (If batch type of pasteurizer, take samples going into pasteurizer and samples after being held for required period).
Milk going into cooler.
Milk from cooler.
Milk into bottling machine.
Milk from bottling machine.
Milk from bottle.

Two samples are taken at each place so that accuracy of results is increased. In addition to this, an empty quart bottle, pint bottle and milk can should each be rinsed with a small quantity of sterile water and a portion of the rinsings should be tested. In this manner an accurate check is kept on every part of the plant equipment. A rise in number of bacteria at any one point, would immediately indicate contamination.

In addition to the above samples, a daily bacterial test should be made of the bottled and can milk when ready for delivery.

The Petri plate method is necessary for making these determinations. Although it will require special apparatus and some training for the operator, the results obtained will amply recompense the milk distributor, because it will enable him to know absolutely the efficiency of his plant operation and to guarantee the quality of his product.

It is also advisable to make a daily butterfat and solids test of the bottle and can milk delivered to the trade.

MILK PLANT LABOR STUDIES.*

Labor Required for Pasteurizing, Cleaning Equipmen and Stacking Bottled Milk and Cream in Storage Room.

Labor for pasteurizing and cooling milk can be use more economically in large plants than in small ones. I the accompanying table are shown the results obtaine from labor studies at 112 plants, arranged according t quantity of milk and cream handled daily. It wi be noted that as the size of the plant increases th amount of milk and cream handled per man in the pa teurizing department also increases. At least one ma must be detailed to this department for plants of a sizes. In small plants this man can do little more tha attend to the pasteurizing machinery during the oper tion. At large plants usually not more than two me are required, so that the quantity of milk handled p man is much greater than in the smaller plants.

In proportion to size, the large plants have mo special men to clean the equipment than do the sma plants. In these the man who operates the pasteuriz often does some cleaning during the last part of th run, which partly accounts for the small amount of mi pasteurized per man and also for the comparative small number of man-hours for cleaning charged to the plants. Large plants generally have a special set of m who spend their entire time cleaning the pasteurizi and cooling equipment. While a special cleaning cre would not be practical for small plants, many lar plants have found this system very desirable a economical.

When the total amount of labor for pasteurizing t milk and cleaning the equipment is considered, it w be noted that there is not so great a difference betwe the amount of milk pasteurized per man hour at t small plants and at the large ones.

In regard to stacking the milk and cream in the st age room, the size of the plant is not an important fact It will be noted that the number of bottles stacked the storage room per man hour is quite uniform fr plants of all sizes. Practically the same system is us at all plants, and one man can handle about the sa amount, regardless of the size of the plant.

Man Hours used at Plants of Various Sizes for Pasteuriz and for Cleaning; also for Stacking the Bottled Milk in Storage Room.

Group	Gallons	No. of plants in group.	Gallons pasteurized and cooled per man hour.	Man hours cleaning pasteurizing equipment.	Gallons pasteurized and cooled per man hour, including cleaning.	Bottles stacked man hour.

PREPARATIONS BEING MADE FOR MICHIGAN CONVENTION, FEBRUARY 7-11, 1927.

Plans are taking shape for a most successful conven- ion, to be held at Jackson, Mich., on February 7 to 11, iclusive, by the Michigan Allied Dairy Association, hich organization embraces the various units in the airy industry of that state.

According to D. W. Shiel, Hillsdale, secretary of the Iichigan Allied Dairy Association, much interest is man- ested in the dairy exhibit to be held in connection with he convention. Mr. Shiel advises that 45 firms have lready made plans to exhibit at Jackson, and he urges ll those interested to write him immediately. Floor lans have been mailed, but if you have failed to receive our copy write for it to Mr. Shiel at Hillsdale, Mich.

Officials of the association predict this will be the best nd biggest exhibit ever staged by the Michigan dairy ndustry.

Hotel accommodations at Jackson are ample, we are dvised, but all are urged to make their reservations ithout further delay. The Hayes Hotel will serve as onvention headquarters, but the Otsego, Delvan and ackson Hotels will house many dairy visitors during he week of February 7.

The tentative programs of the various units indicate hat current subjects of interesting topics will receive tention, and a goodly portion of entertainment is prom- ed by the Michigan Dairy Boosters, the supplymen's ganization, who have the reputation of being among he best hosts in the country.

Martin Seidel is president of the Michigan Allied Dairy Association, with Bert Reed, vice-president, and C. H. Parker, treasurer. The officers of the Michigan Market Milk Dealers' Association, which organization will play an important part in the success of the Jackson convention, are Chas. Babcock, president, and C. R. Nicholls, secretary.

⁂

MERGER ANNOUNCED.

The Springfield Dairy System, Inc., Springfield, Mass., has been merged with the Dairy Systems of Manchester, N. H. This decision was arrived at by the stockholders of the organizations involved and the combine will now be known as the United States System, to be capitalized at $1,500,000. Stockholders in the Springfield system will receive 12½ shares of the United Stock for every 10 shares now held in the Springfield Dairy System.

O. A. Tuttle of Hardwick, Mass., will be president of the new organization.

⁂

FROM ONE THOUSAND TO FIFTY THOUSAND.

In the advertisement of E. A. Kaestner the Baltimore firm that makes the Faultless line of automatic holders, it will be noted that in stating the capacities the advertisement reads from 1,000 to 10,000 pounds per hour. This should read from 1,000 to 50,000 pounds.

WANT DEPARTMENT

HELP WANTED

(Rate: 2c per word)

WANTED—Salesmen to sell as side line to the milk and dairy trade a marvelous new cleaning compound. Better than alkali or soda for cleaning bottles and equipment. Quick sales. Big repeat orders. Liberal commission. Seacoast Laboratories, Sea Bright, N. J. 11-26

WANTED — Middle aged man, married, to go into partnership in dairy business. Must be experienced. Address: D-640, The Milk Dealer. 11-26

WANTED—Strong and healthy man to work in milk distributing plant in Charleston, S. C. Must have experience in making tests, must know butter, cheese and cultured buttermilk making and operation and handling refrigeration. Please make full statement of your experience, furnish reference and state salary wanted. Address Rephan's Sanitary Dairy, Charleston, S. C. 11-26

POSITION WANTED

(Rate: 2c per word)

POSITION WANTED — Am experienced and trained in advertising and selling. Specialized in production and manufacture of dairy products, by-products and product analysis. Age 32 years, married. Graduate of mid-western university and now employed in eastern university as professor in market milk. Desire business connection. Address: D-648, The Milk Dealer. 11-26

POSITION WANTED — As manager or foreman by man with years of experience in evaporated and condensed milk. Will accept other position where chance for advancement offered. Also experienced in plant sanitation and laboratory. Salary and full particulars requested in first letter. Address: D-647, The Milk Dealer. 11-26

POSITION WANTED — As manager or superintendent of market milk plant. Have had years of practical experience. Have executive abiiity and sales experience. Can build up a new or a run down business. Understand the business from the cow to the consumer. Can give references as to past success. Address: D-634, The Milk Dealer. 11-26

"Answers on Refrigeration"

(A practical treatise for the engineer.)
By Gideon Harris and Associates.

This book will assist him in the most economical and efficient operation of your plant.

Read this table of contents:

Introductory.
Underlying Principles of Refrigeration.
Materials Used in Refrigeration.
Heat and Cold.
Mechanical Refrigeration and Ice Making
Ammonia Compression System.
Ammonia Condenser.
Chemistry and Distillation.
"Points" Relating to Water Distilling.
Cooling Towers.
Ammonia Absorption System.
The Ammonia Pump (With Illustrations).
"Points" Relating to the Care and Management of the Absorption Plant.
Carbonic Acid System.
Vacuum System.
Compressed Air System.
Sulphurous Acid System.
Circulation Systems.
Mechanical Ice Making.
Varied Uses of Refrigeration.
Goods Storage.
Storage House Operation.
Measurements.
Cold Storage Houses.
Refrigerating Pipe Lines.
Emergencies and Accidents.
Ice From Raw Water.
Tables and Data.

Want Ads are accepted up to 7th of month preceding date of issue. Forms close on that date.

POSITION WANTED—By married man highly trained in modern milk business and Cornell dairy school. 18 years practical and technical training in all branches, city and country plant management, technical control on all by-products, bacteriologist. Seven years in present position. Excellent references. Any desirable location. $300 to start. Address: D-639, The Milk Dealer. 11-26

FOR SALE or EXCHANGE

(Rate: 5c per word)

BUSINESSES

FOR SALE — Milk plant completely equipped. Operating eight wagons in city of fifty thousand in central Michigan. Good supply of milk. Address: D-615, The Milk Dealer. 12-26

FOR SALE—Milk plant in college town of 3,000 in Ohio. Pasteurizing 250 gallons milk daily. Also jobbing butter and ice cream. Address: D-642, The Milk Dealer. 11-26

FOR SALE — Wholesale milk business, fully equipped. Located in Florida. Doing good business. Good reason for selling. Address: D-649, The Milk Dealer.11-26

FOR SALE—Half interest in wholesale milk business. This is a wonderful opportunity as the business is steadily increasing. Address: D-650, The Milk Dealer. 11-26

MACHINERY AND SUPPLIES

FOR SALE — Type J Milwaukee fille like new, used only eight months. Ha two motors. First check for $350 take it. Address: D-637, The Milk Dealer. 11-2

FOR SALE — Refrigeration Machines — Used—We have several used and new machines of nationally known make, whic we can sell at a big saving to you. Wi erect and guarantee the plants fully. Address: Erecting Engineers Company, 472 West Lake St., Chicago, Ill. 10-26

FOR SALE—Ice making and refrigerating machinery. New and rebuilt. Ou prices on new Waynesboro refrigeratin equipment, delivered and installed ver low. Buy direct from the manufacture All sizes. Get our prices on your requirements. Geiser Manufacturing Compan "Department B," Waynesboro, Pa. 1-2

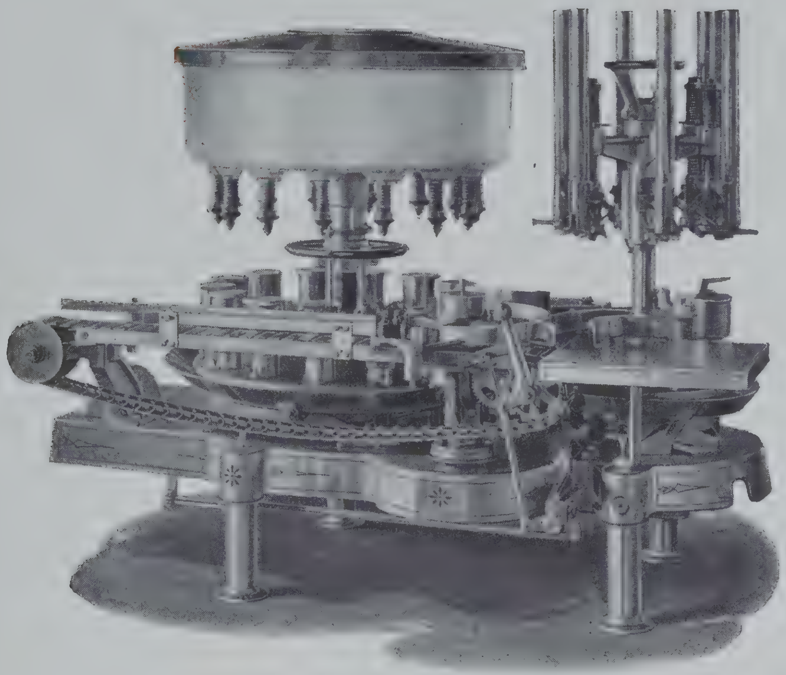
"Straight-Eight" Performance

is characteristic of the Davis



Smooth —Quiet	So smooth does the Davis operate that even at high speed scarcely a sound can be heard. Friction is avoided as all moving parts revolve in a continuous bath of oil.
All Rotary Principle	An exclusive Davis feature. Bottles never stop or make right angle turns when on machine. They are automatically transferred from fillers to cappers without stopping or changing speed. Cappers are never overworked . . . milk is not spilled . . . bottles are never bunched or broken.
Mechanical Simplicity	Entire mechanism consists of one drive shaft which operates the filler, transfer wheel and capper. Conveyor and feeder wheel are operated from auxiliary gear on transfer gear.
Perfect Filling —Capping	Davis Filler Valves are extremely simple, easy to clean and always fill to proper level, not above or below. Six capping heads (No. 5 size) eliminate necessity of frequent reloading.
Dependable —Reliable	Expensive and annoying breakdowns and tieups are permanently avoided as the Davis is built of the finest materials. Heavy duty construction throughout enables users to maintain a definite operating schedule.

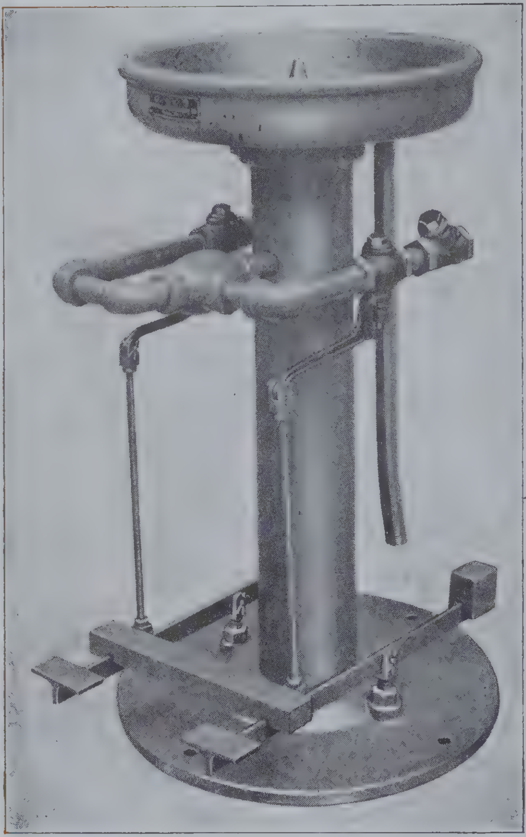
"FOR BETTER MILK HANDLING"

Clean Cans mean more Business for YOU . . .

The YORK Can Washer and Sterilizer will give you clean cans at a minimum cost



The YORK Can Washer and Sterilizer

Press the pedal on the right and you get cold water. Press the pedal on the left and you get steam. Press the cross bar in the center and you get hot water.

The can is inverted over the nozle which sprays in all directions. The hot water washes. The steam sterilizes and the cold water rinses.

Nothing could be simpler or more efficient than the YORK Can Washer and Sterilizer. It does the job quickly and thoroughly.

This piece of machinery is made by us "for better milk handling."

It is fitted with standard plumbing valves and guaranteed to stand up under constant use.

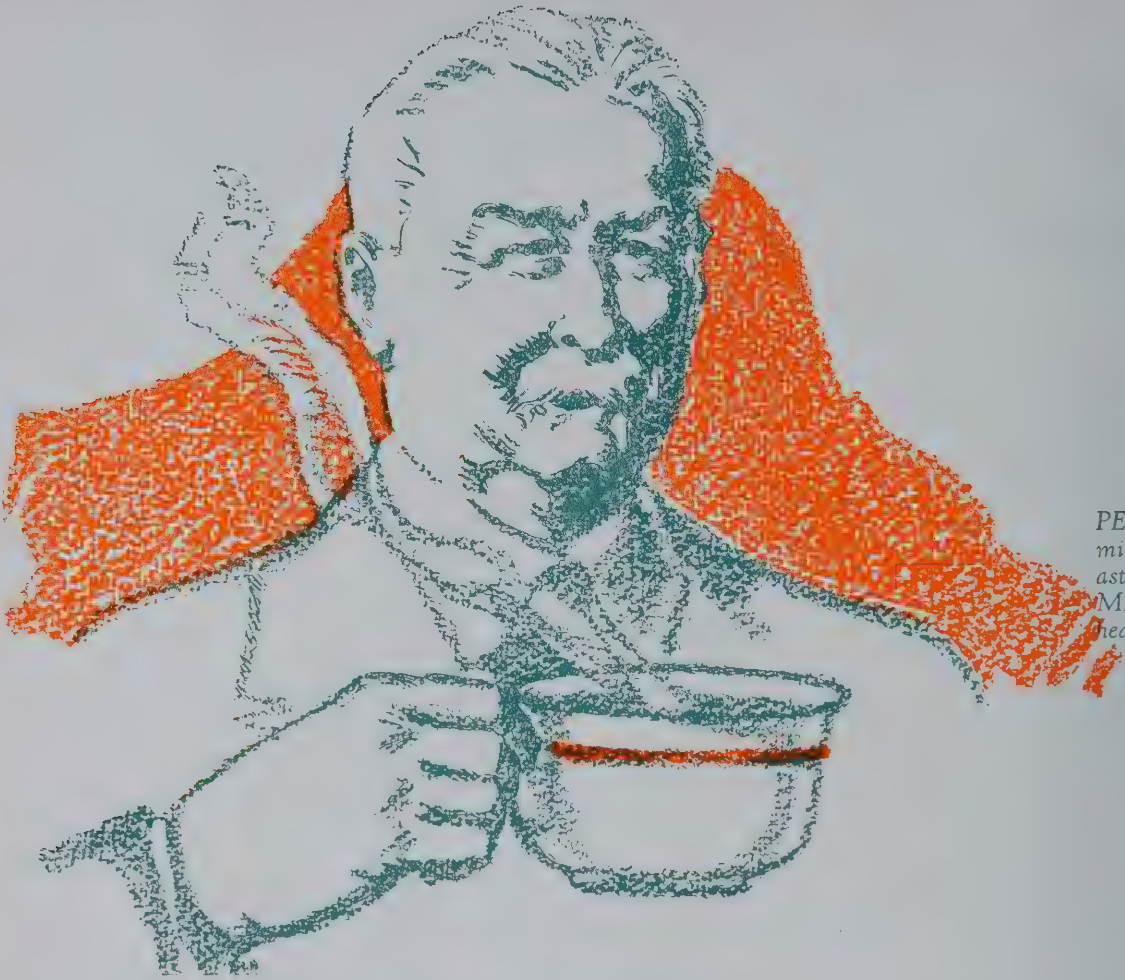
THE MILK DEALER

Volume 16 DECEMBER 1926 *Number 3*



PEOPLE who never drank milk before are enthusiastic about COFFEE-MILK—the invigorating health builder.

A New Way to Increase Your Mil Business

Every day will bring you dozens of new customers for COFFEE-MILK in offices, shops, stores and homes.

To sell Coffee-Milk is to immediately jump up your daily sales. Coffee-Milk combines the refreshing effects of the finest coffee with health-building milk—hot or cold. Some people do not like milk; or chocolate, or both. But everyone likes Coffee-Milk. In many homes it is replacing coffee. This means that you are actually getting new business that didn't exist before.

Made from full flavored, fresh roasted coffee, highly concentrated in syrup form. Easy to mix with milk; no equipment necessary. Never settles at bottom of bottle; no sediment. Write for prices and sample.

Pop Decides Not to Fire the Truck Pusher

TRADITION
PROGRESS

"Here, Lad—

fire that husky in the lower plant—he's too careless! Last night he ran his truck against a motor and broke a foot off it—so we lose that machine's production until they get a new motor on the job."

"No, Pop—

you can't buy common sense in a truck pusher, but you'd at least *expect* it in a motor maker.

There's always something sideswiping motors—and yet your gang of stiff-back motor assemblers stick to cast-iron feet. If they themselves didn't have clay feet they would weld drop-forged feet to a steel frame—just as in the Linc-Weld Motor.

Then your sweeper could do calisthenics with a sixteen-pound sledge and he couldn't 'drop' a motor."

See Page 7 of the Motor Book. Better get yourself a copy from department 25-12.

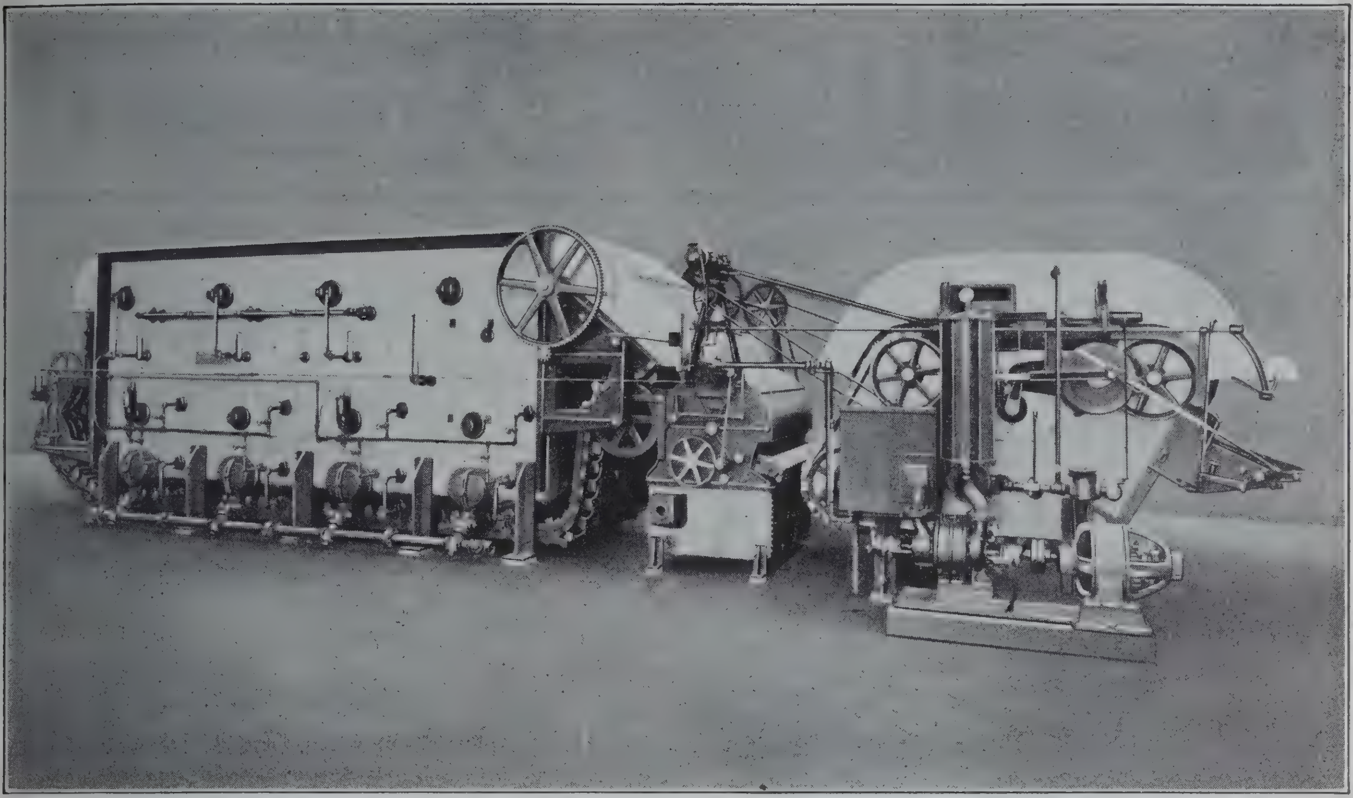
LINCOLN MOTOR



The "ARISTOCRAT" of BOTTLE CLEANERS

Look into our complete Pasteurizing Machine combining in one unit preheating, holding, cooling and refrigerating.

Points of Advantage

Complete separation of caustic soda in Soaker from fresh water in Washer.

No contamination of Washer and Sterilizer by caustic from Soaker.

Thorough cleaning of bottles by caustic solution.

Positive sterilization in Washer.

Maximum soaking volume in proportion to soaking tank space.

Tanks set clear above all floors, keeping plant sanitary.

All tanks closed on top, prevent loss of steam.

No destruction of building by steam and no cloudy bottling rooms.

Handling quarts, pints and half-pints with only one simple adjustment.

Capacity may be subsequently increased by additional compartments added to Soaker.

Mechanical motion of Soaker is continuous.

Patent Soaker buckets operating without friction or breakage.

Soaker compartments completely divided—making each compartment an independent soaker.

Mechanical Washer movement is intermittent.

Double main drives and no high speed operating parts.

Nine automatic safety devices insure continuous operation 365 days per year.

EIGHT complete units adopted and in operation at the Sheffield Farms in New York City.
TWO complete units in operation by United Dairies, London.
TWO complete units adopted by Sidney Wanzer & Sons, Chicago.

Backed up by 25 years continuous experience in building bottle soaking machines.

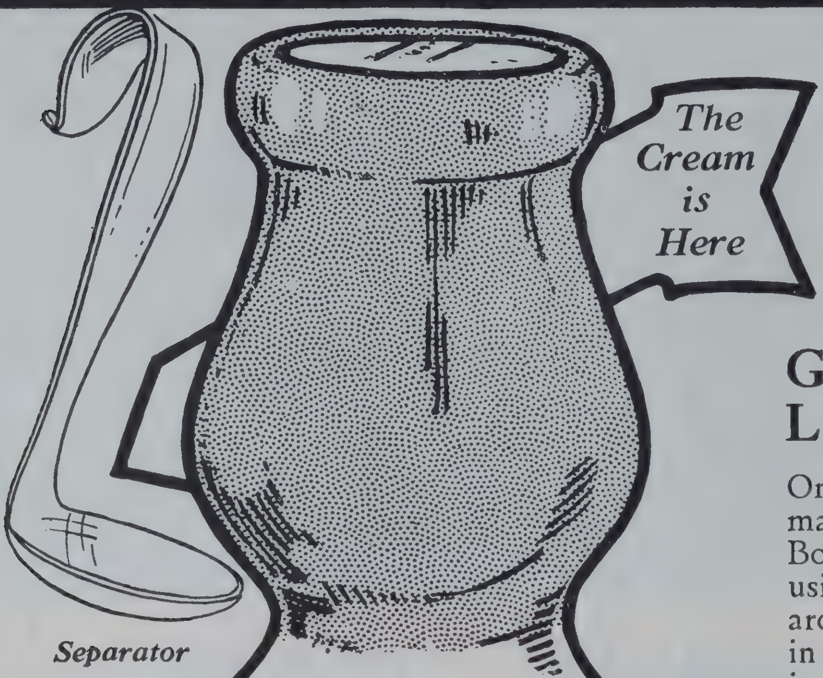
Bottles that Build & hold Business



8 Basic Reasons Why You Should Use Cream Top Bottles

1. Absolutely prohibits use of your bottles by other dealers.
2. Have never failed to produce a substantial increase in business.
3. Develops the cream habit—noticeably increases sales of cream.
4. Shape of bottle prevents use by housewife for preserving.
5. Cream Top Bottles give whipping cream, instead of thin cream, from same grade milk.
6. Instantly recognizable and self-advertising.
7. No extra or new machinery or equipment needed to handle Cream Top Bottles.
8. Cream Top Bottles cost the same as ordinary bottles.

Write for list of dealers using Cream Top Bottles

A Daily Guarantee of Good Faith

Given by 200 Leading Dealers

One of the most significant of the many arguments for Cream Top Bottles is the list of dealers already using them. They set high standards both in quality of milk and in daily service. In over 200 cities in the United States and Canada housewives have enthusiastically rallied to the support of the dairy which put them on, and in each case it has been the leading dairy in the city.

Cream Top Bottles have so many arguments in their favor, we haven't space enough here to explain them all. Write for our present list of dealers and get in touch direct with the one nearest to you. He will tell you what Cream Top Bottles mean to his business.

CLIPPER CASES

Overcome Bottle Case Mortality

Now that the year is about over you will know how many bottle cases "passed out" in the struggle for existence during the previous twelve months.

Ninety percent of this bottle case mortality can be eliminated through the use of Clipper Cases. They do not burn. Your name stamped into them can not be removed without positive detection. They do not split, warp, absorb water or show the effects of time or weather.

Being heavily galvanized, Clipper Cases do not rust and, because of their rugged construction, are practically indestructible.

Tycos Guards $30,000 - $40,000 in Perishable Food Products

Send for Catalog Part 500A for the Milk Industry

D. C. Kerckhoff, President, Pevely Dairy Company, St. Louis, says:

"This plant is practically completely Taylor equipped — having over 40 **Tycos** and **Taylor** instruments installed and six more on order.

"The one most important factor in handling milk and dairy products is temperature. Proper pasteurization is a temperature problem pure and simple.

"All milk, cream and buttermilk pasteurizers are equipped with 12 **Tycos** Recording Thermometers, and the two main pasteurizers have Taylor Temperature Control units operated by compressed air.

"Our 8 holder tanks where the milk is held during the pasteurizing process are equipped with **Tycos** Dial Thermometers.

"**Tycos** Recorders guard from $15,000 to $20,000 worth of dairy products in each of our two cold storage rooms, where an undetected rise in temperature of 5 degrees would cost us thousands of dollars in spoiled butter, cheese, etc.

"Wherever used, **Tycos** and **Taylor** instruments guarantee that the man on the job is on the job."

Chemically Clean Bottles —At the Lowest Cost

IN the Miller Hydro there are no germ-laden brushes to contend with . . . no delicate mechanism . . . no parts that easily wear out with the brushes. Instead, this mechanically perfect soaker year in and year out goes regularly about its business of producing a continuous stream of chemically clean bottles at almost fifty per cent less washing cost.

The Miller Hydro can never wear out. No one has ever discovered a worn-out Miller Hydro even though 3500 machines are in daily use. It is built to give a lifetime of bottle-washing service free from any sort of expensive brush mechanism.

If you consider that the work of a soaker is to polish and scour every dirty bottle to a thorough degree of sterility at the lowest possible cost . . . then you owe it to yourself to install a Miller Hydro. It will soon pay for itself out of wasted profits and the satisfaction it gives will be worth ten times the reasonable purchase price.

Write us today for catalog and names of large dairies who have tested the Miller Hydro under every condition.

Quality Equipment *Reflects* Quality Materials—

Pure Nickel-lined milk storage tank manufactured by The Creamery Package Mfg. Company, Chicago.

The Creamery Package Mfg. Company Adopts Nickel

The Creamery Package Mfg. Company, in using Nickel for pasteurizers, holders and other apparatus, is building the highest quality into its product.

For Pure Nickel reflects quality—it IS quality. It is easily cleaned, and having no coating to wear off, chemical and abrasive cleaners can be used without harm. It is long-lived and permanent because of its toughness and remarkable strength.

But most important of all, it is the safe metal for dairy use. It does not contaminate dairy products and aids in maintaining low bacterial counts.

Being interested in the sanitary and economical production of dairy products, you are interested in Pure Nickel. Therefore, we suggest that you ask your manufacturer or write direct to us for complete information.

Oakland.

IF ANY man in business is justified in feeling that he is contributing to the welfare of humanity it is the man who is supplying city folks with pure milk and pure milk products. The wonderful advancement that has been made in this industry has been an important contributing factor in reducing the mortality rate among children and lengthening the life of man. What a glorious result! Why shouldn't we be proud of our industry?

⁂

PERHAPS the greatest advancement that has been made in the layout of newly erected milk plants lies in more efficient production. Of course, beauty has also been emphasized, but there were beautiful milk bottling plants years ago. Some of them were very poorly laid out. It cost too much money to produce a quart of milk.

Now, in addition to beauty and display, the present designers of milk plants seem to be particularly emphasizing efficiency. Great strides have been made and will continue. It is well. Pronounced increased efficiency will justify the expenditure of big sums of money. It will soon save the cost of a milk plant.

WE SINCERELY hope that the year just drawi to a close has been a very satisfactory one in yo business. If so, and if you are like most folks, you w enjoy the Holiday time more than you would otherwi Of course, there are some folks who can make mer whether business is good or bad, but the most of are not built that way.

Business with most of us is a fight for existence a unless we experience at least a reasonable measure success there is little to laugh at. It's too serious a m ter. We don't mean that we are justified in having t blues every time business slips, but we know that t average mortal is influenced by his ability to meet h obligations and to enjoy at least a few of the luxuri that his heart craves.

So when we express the hope that business is go with you we have in mind the Holiday season just ahea We hope that business will permit you to enjoy it the utmost. We extend our best wishes for a Mer Christmas and a Happy New Year.

⁂

THE big fight for business on the part of many our readers still centers around the pasteurizati problem. In most of the big cities the question has be settled by city ordinances and by popular demand. On pasteurized, certified or inspected milk is sold in mo of the big consuming centers.

In the smaller towns and cities the situation is d ferent. Many consumers still prefer milk brought by nearby farmers. The man in such a city with a mo ern milk pasteurizing and bottling plant often has st competition. He has to fight ignorance and prejudi Every move he makes to educate the consumer relati to pasteurized milk is accepted as a selfish effort to p the farmer-peddlers out of business. Often, too, t farmer offers pasteurized milk, but generally his fac ities are so inadequate that his product is not improv by what he does to it.

Our readers who are confronted with this pasteuri tion problem should never allow themselves to beco discouraged. They should remember that it is not new question. It is as old as the milk bottling busine and that the forces of prejudice and ignorance ha gradually been losing ground year after year. Wh has happened in the big cities will take place ever where. The number of consumers prejudiced agai pasteurized milk is gradually decreasing. Therein li hope for the dealer who would become discouraged. should never deviate from his course. He should pr duce as high quality milk as possible and keep poun ing away.

⁂

WE HEAR a lot about unfair competition in th milk business. This time we mean the editor "we." Lots of folks come to us with their troubl Some of them even want us to "go after" the other f low editorially.

We are dyed-in-the-wool pacifists in this shop—un it is time to fight. We don't like to go after the oth ow until we know that he deserves it. Any investiga- ns we have made only confirm our belief that "the er fellow" is generally just as good a man as his com- itor.

No one familiar with the facts will deny that unfair ctices prevail in the milk business. Salesmen spread ries about competitors that are mean and often rue. They try to poison the minds of housewives inst the products of their competitors.

Do your salesmen do that? Would you admit that y do it? If not, what sort of control do you exercise r your salesmen? Are you prompt to condemn in a petitor what is practiced in your organization?

"Well, we have to meet competition," one dealer l us. Sure you do, and so do your competitors. That where the whole trouble lies.

What's the remedy? Get to know your competitors ter. Go out of your way to treat them well. Meet m around the dining table, in conventions, on the f links, at the summer resort—anywhere, just so you et them often. Learn their problems, agree on a code ethics for your particular territory and then have h that everybody interested is going to live up to provisions.

Give your competitor a chance to prove his worth a man. Then expect the same consideration from n. The chances are you will get it. Boost for the k business, not against it. Help your competitor sell re milk and sell more yourself.

* * *

WHILE you are emphasizing to your truck and wagon drivers the importance of presenting a neat pearance to the trade don't forget to caution them ut being courteous to other drivers. When they nd some other driver they may be offending one of ir best customers.

Drivers of passenger cars are unanimous in their be- that drivers of commercial vehicles think they own streets. They are looking for offense and when it nes even though it may come unintentionally, they sure to note the name of the owner of the offending icle. Why not a course of instruction for your drivers h the thought in mind of gaining a reputation for rtesy on the street?

* * *

WHEN things go wrong in the plant it is pretty hard for a man to keep his mind on the business of the job, the selling end for instance. How to sell e milk is a problem that can wait, but plant prob- s must be solved right away. Some milk plant ners are so fortunately situated that they don't have vorry about their service problems. They have such od organization that somewhere down the line there man, or several men, who can handle these everyday blems better than the boss, or just as well at least. boss, therefore, keeps out of the way and devotes time and energy to the development of his business. This is the ideal arrangement and many, even com- atively small, dealers enjoy such an organization. The owner who feels he must carry the whole load on his shoulders is in a bad fix. No matter how small his organization, he should at least have a man or two in training to assume responsibility. He may think he can stand anything in the way of hard work, worry and long hours, but he is only fooling himself.

* * *

SOME men in the milk business have injured the market milk industry by assuming that pasteurization is a "cure-all" for milk. They hide behind pasteurization, feeling that if the job is properly done in the plant they need not worry about the kind of milk they receive.

The man who adopts such an attitude commits a grievous error. Pasteurization does not make poor milk good. Neither does it make good milk better. It makes good milk safe and keeps it good and safe, that's all. The man who expects more of pasteurization, even when most efficiently done, expects too much.

* * *

YOU men out on the other end of this trade paper business should drop a tear occasionally for the poor editor who is trying to serve you faithfully and well. We can get along without sympathy—we know we can because we have tried it—but just a little tear once in a while would help over the rough spots.

You may think we have no troubles, but if you do, that is because you don't know this job.

We could publish the paper without trouble if we wanted to. We know how it can be done, all right, but we wouldn't get a bit of fun doing it. If we would just fill the pages with wishy-washy stuff that wouldn't stir up any interest, then we wouldn't get a kick from anybody. We could sail along month after month and not know whether anybody reads the paper or not.

Do folks read The Milk Dealer? Well, you would think they do if you could read some of the letters we get. We don't publish all of them, no sir, not on your life. There are a lot of them we could publish, in fact most of them are of that kind, but some we couldn't. The postoffice department would take away our mailing permit if we attempted it.

We can't please everybody, in fact we don't try. If the time ever comes when it is necessary for us to try that we will do the other thing and quit. We are, however, trying to put before our readers information of value to them and to the milk bottling industry. We have made that policy win for us so far and we propose to keep it up.

We like friends. We would like to see everybody happy with each issue of the paper, but we found out long ago that a trade paper, like an individual, can't amount to very much unless it treads on the toes of some people.

Now, what's this all about? Nothing in particular, just generalizing, that's all, but we feel better now. It will help us to forget the loss of a good advertiser who doesn't like some of the good information we passed along to our readers in last month's issue. Folks are that way.

Annual Meeting of the National Dairy Council

"Dairy Industry Must Be United for Future Success," Says Dairy Council Head. Old Officers Re-elected and Plans for the Future Outlined

"ONLY a few years ago the production and marketing of milk was purely a local matter. That time has passed and the dairy industry from farm to family doorstep is now a national problem," said M. D. Munn, president of the National Dairy Council, at the opening address of the annual meeting of the council in Chicago, Dec. 2. "Milk that is produced in Wisconsin, in Iowa, in Minnesota, however it may be marketed, has a direct bearing upon the conditions surrounding the production and marketing of milk in New York City, Philadelphia, Pittsburgh, Boston, Baltimore, Cleveland, or any other city I might name, and likewise the production and marketing of milk in those territories last named have a direct connection with and influence on the same process in Wisconsin and Iowa."

"Every bit of production from the dairy cow, with the exception of what is consumed on the farm, must pass through one of several channels from producer to consumer, either as fluid milk, cream, butter, ice cream, cheese, or other dairy products. Production is absolutely dependent upon the proper relationship of each branch of this industry and it is entirely dependent upon the consumption of dairy products throughout the nation. Producers and consumers and all of the industry which has to do with the preparation of products for market and delivering them in a satisfactory and efficient manner are dependent upon understanding each other and coordinating themselves with each other and realizing that the determination of any one principle that is national in scope by one group without consultation with the others will inevitably have an effect upon the others. Unless we can work out problems of the industry in harmony, with an understanding of the relationship that each bears to the other, we can't hope to have a stabilization of the dairy industry and a proper relationship that will justify continued production and continued consumption. I say what I have about this national aspect because the National Dairy Council has come to realize how important it is, not alone to the industry but to the consuming public and, above all, to the production end of this industry in our endeavor for educational work in the past few years."

"The dairy industry stands more or less alone at the present time, so far as can be determined, in pursuing a broad health program in promoting the interest of the public in its products," reported M. O. Maughan, secretary. "Because the dairy industry has such a vital product in promoting health in both young and old, it has become quite impossible to talk health without talking dairy products. One hundred and seventy-two workers are now spending their entire time in the dairy council in developing and distributing literature, in securing wider publicity in school work, in work with health and welfare organizations, with women's clubs, doctors, dentists and nurses and many other such branches, all of which have a direct bearing on the production and consumption of dairy products."

Dr. E. V. McCollum of Johns Hopkins University, world authority on nutrition, outlined some important recent developments in the scientific world, and especially stressed the present day attitude of health a welfare officials in their efforts to bring about a tr knowledge of the fundamental importance of the diet the health and development of a nation.

"The dairy industry has done very little in an orga ized way to tell the public the necessity of dairy pro ucts in the diet and to support generally this basic scie tific knowledge which it has been handed," said D McCollum. "You have an organization in your dai council that is now recognized nationally. For an indu try the size of yours, receiving about four billion dolla annually to spend so little in such educational work ac ually makes us who have been conducting research wo blush. The American family should be spending per cent of its food budget for its dairy products, whi they now spend but about 20 per cent. We consun more sugar per person today than in the nation's hi tory."

Dr. Carey McCord of Cincinnati told of research wo among factory employees in plants where lead is us in making of batteries, paints and varnishes, where m were subject to lead poisoning, which caused a large pe centage of disability. In many instances, he stated, m were permanently disabled. At the outset of his invest gations two years ago, Dr. McCord advocated the m drinking at least a quart of milk, and in one factory 365 employees the factory has been using 365 quarts milk each day. From his investigations Dr. McCord convinced that the regular use of milk for the men w reduce disability at least 75 per cent, and although is still making detailed studies he believes that the use milk will absolutely prevent lead poisoning among t workmen, when given in connection with other sanita measures, which help to keep down the dust and oth means of inhaling the lead. Dr. McCord recommende that the dairy industry could well afford to investiga and conduct research studies into the decided value milk for factory employees throughout the nation.

During the afternoon, typical dairy council activiti were featured by demonstrations, such as are given the schools and before women's clubs and by the show ing of special Boys' and Girls' 4-H Club demonstratio on the uses of milk, given by a group of girls from Ham ilton county, Iowa, who are members of the Boys' an Girls' 4-H Club.

Officers re-elected were: M. D. Munn, president; A. Walker, 1st vice-president; E. M. Bailey (Pittsburgh 2nd vice-president; M. O. Maughan, secretary; T. A. Bo man, treasurer; C. T. Hays, assistant treasurer.

President Munn's Address in Full.

"I can recall the fact that only a few years ago th production and marketing of milk was purely a loc matter. You men who are engaged in the productio and distribution of milk, if you will recall the position you were in 20 years ago in the purchasing and marke ing of milk, will realize, I think, that at that time you business was entirely a local matter. It was acquirin milk from the farmers surrounding your cities and sellin it to the people in the city, and you were not called upo

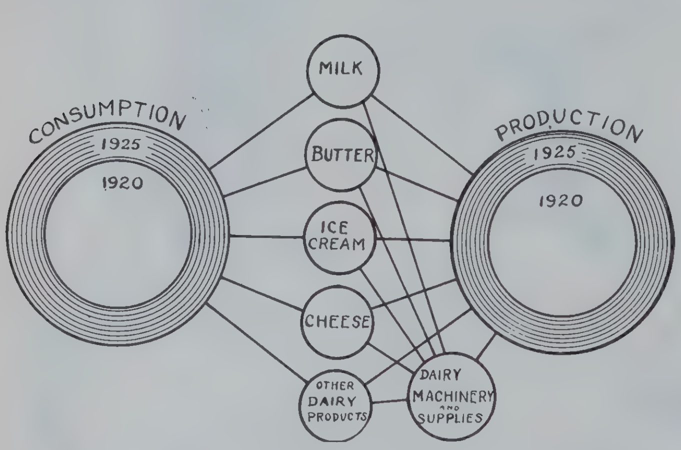
to give much thought to what was transpiring in other places, excepting as you were checking up the conduct of your own business in a purely local way.

"That time has all passed and the production and marketing of milk today is a national problem. Milk that is produced in Wisconsin, in Iowa, in Minnesota, however it may be marketed, has a direct bearing upon the conditions surrounding the production and marketing of milk in New York City, Philadelphia, Pittsburgh, Cleveland, Boston, Baltimore, or any other Eastern city I might name, and likewise the production and marketing of milk in that territory last named has a direct connection with and influence on the same process in Wisconsin and Iowa.

Developing National Organizations.

"The various organizations making up this industry, like the producers' organizations, the milk dealers' organizations, the butter organizations, the ice cream organization, and the cheese organization, of themselves developed into national organizations. Why? Because they had to keep growth with this nationalization of this great dairy industry; so that the problems of the butter man, the cheese man, the ice cream man and the milk dealer are inevitably tied up with each.



"That being the case, this educational work must and has taken on a national aspect, and before I take up that particular subject, I want to picture to you a little more vividly by chart how completely the production, the manufacture, the marketing of milk and its products are interwoven, inseparably interwoven. I have tried to make a very simple chart to picture this.

"Here are two circles that represent the production and consumption of milk and dairy products. That is all there is to it. In 1920 this white area represents the production; the consumption is represented by the white circle of 1920 as well. You see those are substantially of equal size. The red circle represents the increase of 27 per cent that has taken place in both production and consumption of milk between 1920 and 1925. See the magnitude based upon the government figures.

Production Depends on Consumption.

"You will notice those figures are substantially the same size, but we shouldn't forget this thought: the success, the stability, the continuation of activities in circle described as Production depends absolutely upon what takes place over in the circle entitled Consumption, and unless the circle entitled Consumption keeps even with or a little ahead of the circle we call Production, there is stagnation in this industry.

"I shall refer a little later on to how the dairy council educational work helps to keep these two circles in proper relationship.

"What takes place with this great United States a
of production? Everything that comes out of it, w
the exception of what is consumed on the farm, mu
pass through one of these lines indicated on the cha
It either starts for the Consumption circle through flu
milk, through butter, through ice cream, through che
or other dairy products, such as evaporated milk, m
powder and condensed milk, etc.

"These are all absolutely dependent upon the prop
relationship of those two circles, Production and C
sumption.

"The milk man may say, 'What have I to do w
cheese, with ice cream? What have I to do with butte
Do you suppose it is possible to restrict our increas
flow that reaches circle Milk without having some eff
upon the circle Butter? Or vice versc? Those are
pendent upon understanding each other, co-ordinati
themselves with each other and realizing that the det
mination of any one principle that is national in sc
by one group without consultation with the others w
inevitably have an effect upon the others. Unless we c
work this out in harmony with an understanding of t
relationship that each bears to the other, we can't ho
to have a stabilization of this industry and a prop
relationship that will justify continued production a
continued consumption.

"The great machinery and supply group,—see wh
they tie in. They go to production, everyone of the
they go to every one of the activities we call the co
modity or marketing activities, and they in turn are
fected by whatever transpires in the relationship of th
groups. They are interested in both the production a
the consumption, and because their activities are me
ured by what takes place between the relationship
these as it passes through this line of marketing avenu

"I want to get that fact in your mind, because mu
has been said here in the past two or three days of da
meetings, and much discussion has been had that does
perhaps—and you will pardon me for saying it—fu
synchronize with the relationships I have tried to
scribe here.

Industry Will Grow.

"But, this industry in its great national relationsh
is too important for anyone to say, 'we mustn't go
in this endeavor to build,' because as sure as you
something is going to happen to the mechanism of th
relationship. On the contrary, we must and we will
ourselves co-ordinated. We are going to understa
each other better as time goes on, and it's going to co
more or less through this endeavor to stabilize the re
tionship between the Production and the Consumpt
circle.

"That brings me down to this educational endeav
I have said what I have about this national aspect,
cause I feel keenly that we must realize in our work h
important it is, not alone to the industry but to the co
suming public and, above all, to the production end
the industry.

"In our endeavor for educational work, a little o
six years has now passed since we took this work
when we began this work we found somewhat the sa
condition that is confronting the industry today in e
relationship of the various organization activities.
didn't know just which way to go. It took us a ti
to find the avenue of least resistance and best resu
We finally found it but we never lost sight of this id
that this industry by reason of its tremendously impo
ant relationship to child life and adult physical and m

l efficiency, should be placed in a little different posi- on than a mere commercial endeavor.

Building on Fundamentals.

"We felt it was necessary to get this story to the ild in its proper relationship to a health program be- use otherwise we couldn't get the avenues that were ecessary to reach the child nor to reach the mother nor reach the welfare worker. We also realized that the sults which would follow an increased consumption of ilk and its products would be more successful, more ermanent, if it was in a balanced health program be- use milk and its products doesn't have the same re- lt with the child or with the adult who is disregard- g other health requirements. Therefore our preach- ent would be more sound, the future would be more cure, if we could fit into a broad health program where l these agencies and activities could pick up and co- erate with us in helping to put the message over, and has been a great gratification to see how splendidly at program has worked out.

"In the course of six years all suspicion of commer- al endeavor being coupled with educational endeavor health endeavor has disappeared. We have the con- lence of the scientific world and the medical world, the elfare world and the educational world to such an ex- nt that they do not now question our motives but glad- accept our offers of co-operation.

Working With Many Organizations.

"I want to picture to you again here by chart form little of that national aspect. I don't know whether u can all read this chart in the back of the room, but e have grouped together the four great divisions of ucational and welfare activities and we find under e educational institutions we have the schools, the nor- al schools, the universities, departments of agriculture d state colleges, extension departments through Boys' d Girls' 4-H Clubs, women's clubs and camps, home onomic departments,—all falling into the educational oup.

"Then we have the national organizations, like Boy outs and Girl Scouts, Campfire Girls, Federated omen's Clubs, Parent-Teachers organizations, anti- berculosis associations, Y. M. C. A. and Y. W C. A.

"The professional group in public health consists of ctors, dentists, public health officers and public health rses. And then, we have industrial groups—health asses in industrial plants and business organizations d factories, a very important educational activity in is industry, as the industry will learn in the very near ture.

"It is a pleasure to be able to say that there isn't a gle agency named there with which we are not today -operating to a greater or less extent, and largely a eater extent, and solely because of the breadth we gave this broad work we are carrying on as the agency of e dairy industry.

Council Organization Nationwide.

"In the beginning of our unit council work—and ght here let me stop to say that in speaking of the uncil organization, national in its scope, I want it dis- ctly understood that I am not speaking of the Na- nal Dairy Council office alone; I am speaking of all e various unit organizations which, with the so-called tional, makes up this national effort and the council ganization is national in scope because of the fact that various sections of the country these units are organ- d and functioning in a co-ordinated manner, and that ves the national scope and aspect to this work when that is coupled with what we are doing from the central office in the unorganized territory as well as co-operating with the organized territory,—in the beginning we found that our endeavors were confined, to a much larger per cent, to the schools than now. I am speaking now of the council units themselves.

"Why? Because it was new, the teachers hadn't been yet trained nor had they received the vision of what we had in mind. Health work in public schools as a part of the regular curriculum is a matter of recent origin and a large percentage of teachers, when this was put into the school curriculum, didn't know what to do or how to do what they were asked to do.

"We came along with this program which we have never endeavored to superimpose upon the schools but have offered as a suggestive method of carrying on a part of that work. The result was that the schools began to take it up and we had in the beginning to devote a large portion of our activities to schools themselves, and we found as we went along that here and there a teacher became trained, she could then take it up and carry it on herself, using our material herself without any effort on our part to help her other than to furnish the material.

Schools Only Part of Work.

"So today in the organized unit territory we find that the activities in the schools takes one-half of the time of the council unit. This is the average of all the organized units as disclosed by very definite reports from secretaries and nutritional directors of each one of the units, so that today in the organized territory we are devoting one-half of the time of the workers to the schools and then it divides up into the other groups—a part put into administration, a part goes into adult groups, into nutrition classes, supper clubs, women's clubs and organizations of that kind. Then it goes into the industrial group, into the factories, into the stores. Then it goes into new material. We have to spend a lot of time in preparing new material and then other activities of greater or less extent in accordance with the unit such as the playground work, camp work, and so on.

"But we are covering a much larger number of schools periodically that we could before because of this knowledge that has gone to the teachers who themselves can take up the work when we merely present it and explain it to them. We don't have to stay and build it there—the story or the slide talk, or whatever it may be —so that with the same number of workers in any one unit we are able to cover a much larger amount of schools in a given length of time than we could before. I expect that to go on still further so that as these council units in the next five years develop we will find a still greater reduction in the time necessary for the workers to put in the schools and a greater time available for activities in these other groups.

"Whatever is done in the national office is a part of the same program as carried on in each one of the 15 organized units; in other words, this program is national in character because of its uniformity and because of the breadth of its reach. We find ourselves in the national office in an embarrassing position because of the cumulative effect of this effort from the national office, and I want to call your attention to that here.

Started With Few Exhibits.

"In 1925, last year, we started out setting up some exhibits for conventions, welfare gatherings and other places where educators, people get together, as an experiment, really, and we put on what we call 15 planned exhibits, and as a result of the use of these 15 exhibits

Secretary's Report Shows Splendid Progres

Annual Report by Secretary Maughan of the National Dairy Council Covers Record Year in National and Regional Council Activities. "The Future Depends on the Dairy Industries"

THE past year has been the best year in the history of the dairy councils. With more workers, a total of 171, also with added support from the welfare organizations, the schools and other groups interested in health, the dairy council movement has moved forward splendidly.

The Dairy Council Program.

As is well known the dairy council program is a broad one in which is taught the eight fundamental rules of health shown in chart No. 1.

The dairy council workers have felt that it was decidedly advantageous to make the program broad and comprehensive rather than to have it restricted to commercial propaganda featuring only dairy products. We felt that the general public would re-act more favorably if a broad program of health was featured rather than a narrow, selfish one.

Avenues of Publicity.

The dairy industry stands more or less alone at the present time so far as can be determined in pursuing such a course. We are thoroughly convinced that this was and is the right thing to do, because by us featuring this broad program which includes all the fundamental rules of health the dairy industry has been able to carry its message into the schools, into the mothers' clubs, into the factories and into numerous other avenues and important places as no other industry has yet been able to do.

Dairy council work is now recognized by practically all of the school teachers in the United States, as well as by many doctors and dentists and other important groups and individuals as being unselfish in its interests and strictly reliable in its teachings.

Chart No. 3 shows the avenues through which dairy council work is conducted.

Because the dairy industry has such a vital product in promoting health in both young and old it is becoming easier each day to conduct dairy council work in the channels just referred to. With all the information a
hand regarding the virtues of dairy products and thei
important place in the diet it has become quite impo
sible to talk health without talking dairy products.

The Dairy Industry Decidedly Fortunate.

On practically every hand information has accumu
lated to prove the added and superior food value of dair
products in the human dietary. Just recently a very ex
tensive experiment was conducted by the Medical Re
search Council of England in which a colony of boy
(220) was carefully studied. They found, for exampl
that with the addition of one pint of milk a day to
diet, which by itself satisfied the appetite of growin
boys fed upon it, that the boys converted an average an
nual gain in weight of 3.85 pounds per boy into a gai
of 6.98 pounds, and an annual average increase in heigh
from 1.84 to a height of 2.63 inches. In other words
as a result of adding the extra pint of milk to the dail
diet, they increased in weight 81 per cent and in heigh
42 per cent over the average gain. Quoting from thei
report they say: "After eighteen months' observation
casual visitor entering the dining hall, where the boy
of nineteen houses sit at tables, would never fail to recog
nize the table of that house which was alone receivin
the extra ration of milk, the boys of that house bein
obviously more fit than those of any other house."

The report further states that, "During one year o
the experiment there was a complete absence of illnes
among the boys with the milk ration whereas among th
other boys the sickness rate that year was higher than
usual because of outbreaks of influenza, measles an
scarlatina."

This same extensive experiment proved in no unmis
takable terms the superior value of butter over marga
rine. Twenty-six boys received 1.75 ounces of butte
daily in addition to the basic diet, they gained an averag
of 6.30 pounds per boy and increased in height 2.2
inches per boy during the 12 months, which is an in
creased gain in weight of 63 per cent and in height o

per cent over the basic gain because of the addition butter. Sixteen boys were fed the same basic diet d in place of butter they received vegetable margarine, y gained an average of only 5.20 pounds per boy and reased in height only 1.84 inches per boy during 12 nths. This is an increase in weight of 35 per cent, but olutely no gain in height whatsoever. Chart No. 4 strates this graphically.

The basic diet consisted of: Potatoes, bread, beef, k, herring, sausage, dumplings, cabbage, beets, beans, s, porridge, lettuce, cheese, cocoa (10 ounces fluid ice daily containing a total of two to four ounces of k), margarine, jam, raisin suet pudding and rice pudg.

This is only one of numerous experiments which have n conducted during the past few years to prove the nderful value of dairy products.

Organized and Un-organized Territory.

Dairy council work naturally divides itself into two dings—first activities in organized territory and secl activities in un-organized territory. Dairy council ts are now established in Boston, Hartford, Connecit, Philadelphia, Baltimore, Pittsburgh, Detroit, Ciniati, Indianapolis, Waterloo, Ia., and San Francisco. m each of these pivoted points work is carried into adjacent territory. For example, the Pittsburgh ncil works in 51 cities and towns, the Connecticut ncil in 28, while the council located at San Francisco ers the entire state of California, having done work 91 cities and towns in the past year.

The main difference between dairy council work in anized territories and in un-organized territories is degree of intensity of the work. In the places where y councils are located intense work is conducted, e contact is established with the schools and mothers' bs and all other groups interested in health, a perent corps of active works is established in organized s, whereas on the other hand in un-organized terri work is done only occasionally, the staff is not a manent one, in fact the workers are sent out from National Dairy Council headquarters at Chicago. It aturally the desire to get the entire United States nized into dairy council units as rapidly as is pracble.

Finances.

hart No. 5 shows the finances of the various councils ung the past year. Dairy council work is financed he dairy industry, this being the only source of revenue. The milk producers and the milk dealers in the organized territories each pay ordinarily one cent on each 100 pounds of milk handled. All of this money except approximately five per cent is retained locally in the territory in which it is raised and it is expended in that same territory. The five per cent is sent to the National Dairy Council to help cover the expense of national publicity, such as the expense connected with exhibits at the national conventions of school teachers, of doctors, of dentists, at the convention of American Public Health Association and before other important groups and in other national activities.

Money from the machinery branch of the dairy industry is sent to the National Dairy Council office at Chicago, likewise the funds forthcoming from the butter men, the ice cream men and other branches of the industry.

Dairy Council Work Rapidly Expanding.

It is not our intention in this report to go into details and should details be desired they can be secured through the secretaries of the various dairy councils or from the central office at Chicago. Suffice it is to say our workers have been intensely busy during the past year, more than ever before, in carrying the health message to the boys and girls and grown-ups in this great country. We believe strongly in personal contact and as a result a few more than 12,000 demonstrations, stories and talks have been given before audiences totally over 3,000,000. Nearly five million (4,960,003) pieces of literature have been distributed. Nearly 6,000 (5,851) film showings have been recorded and 1,703 plays have been staged. It has been conservatively estimated that 20 million people have heard the dairy council's message of health in one form or other during the past year. However, it must be recognized that the average person must be told a good many times before being convinced, and **he must be appealed to in various ways.** Hence the need of continued work on these 20,000,000 people, also the need of starting work on the remaining 95,000,000, the majority of whom can be reached by enlarging upon dairy council activities.

School Teachers Desire Material.

The school teahers especially have keenly recognized the great value of dairy council work and have made heavy demands upon us. An illustration of the increased interest toward dairy council work on the part of the school teachers is shown in the increased number of

Making the School Kiddies Strong and at the Same Time Saving Money for the Taxpayers

"The Pied Piper of Health" in Wichita, Kansas, is Teaching the Parents of School Children That the Health Problem is a Community Problem. He Makes His Program Pay Out, Too, in Dollars and Cents

IN THE November issue of The Milk Dealer we published a most interesting story about health work in the public schools of Wichita, Kansas, in which the DeCoursey Cream Company financed the first year's work and were joined by all the other pasteurizing plants in the following years.

Back of all such movements can be found a "moving spirit" and in this case that "spirit" is "The Pied Piper of Health," H. T. Corson.

There are some additional conclusions to be drawn from this excellent health movement and in a recent letter Mr. Corson sums them up as follows:

"HEALTH. This should be the first subject taught in our schools, for, without health, education would avail us but little.

"Our educational system has been conducted backwards, and, until recent times, have we given much thought to the question of health in our schools.

"This was supposed to be a question for the homes to care for and, in a great many instances, this is still the opinion, health questions are a subject for home training and not for the schools; however, we are changing our ideas more and more along this line and are realizing that health is a question that must be handled from a community standpoint.

"This fact was very forcibly shown, in the Milk for Health campaign, which has been conducted in Wichita, Kansas, the last few years.

"The school nurses, under the able leadership of Miss Genevieve Lill, supervisor of health of the public schools, weighed and measured each pupil of the elementary schools at the beginning and close of each school year, and the figures for the last three years are very interesting.

"At the beginning of the school year for 1923, there were thirty per cent of the boys and girls who were more than ten per cent underweight.

"Health programs were put on, milk served in some of the schools, with the result that at the end of the school year, June, 1924, the number of underweight children had been reduced to eighteen per cent.

"During the period of vacation, when the children are under the care of the parents, the health work is neglected more or less, and on the opening of school in September, 1924, the children were again weighed and measured, and the per cent of underweight children had mounted to twenty-four and one-half per cent.

"The health program is again taken up in the schools, more schools co-operating, more milk is served and at the end of the school year, May, 1925, shows the number of under-weight children reduced to 12 per cent.

"The vacation period again shows the lack of organized work, with the children returning to school in September, 1925, when the number of under-weight children was found to be twenty-two per cent; again the heal work was resumed and June, 1926, end of school yea there was seventeen per cent under-weight children.

"At the beginning of this school year, the surv showed that there were nineteen per cent who were mo than ten per cent under-weigt.

These figures show very conclusively that the wo of building up the bodies of our boys and girls can done through organized effort, much better than wh left to the individual parents.

"One might say, 'What is the use of building up o boys and girls during the school year, to lose it duri the vacation?' However, if we will ignore the figur showing the loss of ground during the vacation peri and look only at the figures at the beginning of the sch year, I think it will be very encouraging.

"At the beginning of the school year, Septemb 1923, there were thirty per cent of the boys and gi who were more than ten per cent under weight; Septe ber, 1924, twenty-four and one-half per cent; Septemb 1925, twenty-two per cent, and September, 1926, ni teen per cent.

"One of the main contributing factors to these sults is shown in the report of the health commission which shows that since 1923 the consumption of mi per person, per day, has been doubled in the city Wichita.

"To meet the argument of some, who look only at t monetary side of the question, we decided last year try and make a showing, as to what could be saved taxes by health work in schools.

"Every time a child fails in its studies, and must the year's work over, it costs the taxpayer eighty d lars, as that is about the amount it takes to put a b or girl through one year of the elementary school.

"We chose one room in one of the schools where could have full co-operation of the teacher, this room the end of the school year in 1925 had had six pupils fail, and this would cost the taxpayers four hundred a eighty dollars.

"The next school year there were thirty-eight pup in this room and nineteen of them were more than per cent under-weight.

"Miss Mable Forney, the teacher in this room, tered into the spirit of this work wonderfully, Health Game Contest was put on, games were played stimulate the interest in the contest, under-weight c dren served milk and at the close of the school y there was not a single pupil ten per cent under-weig and only one failure, thus saving the tax payers f hundred dollars in this one room, over the amount wh it had cost the previous year.

Collection Methods Which Collect

Suggestions for a Series of Collection Letters that Have "Brought Home the Bacon." How to Get the Money and at the Same Time Make Them Like It

By FRED E. KUNKEL

NOT everybody can sit down and write collection letters which collect, but anybody can use tried and proven plans which have brought home the acon for others, and here is a method which has proven uite successful for one dairyman in wiping out some of e old overdue accounts. He got tired of carrying a t of accounts well in arrears, so he decided to clean em up with a sweeping collection system, placing them suit, or charging them off to profit and loss.

"In the modern age of the budget plan, the installent sale and the deferred payment idea, or whatever uise extended credit may parade," says this dairyman, it is becoming increasingly more difficult to collect overue coin, probably because the over-extension of credit as lent itself to an over-inflation of buying impulse, reilting in a condition where the borrower outjibs the nder.

"More people are buying houses today than ever bere, and automobiles. And so long as we are living in age of 'credit,' it becomes necessary to adjust the ardstick of collections accordingly. While I would like do an all-cash business, yet I find credit a necessity achieve a larger volume of sales. A great many peoe are used to buying everything on credit, and they do t like to pay cash, nor do they like the 30-day plan—ey want 60, 90, or more days—yea, a lifetime, so it ems to me.

"And since every extension of credit involves its ecessary percentage of risk, I found it necessary to ingurate and keep in good running order a good plan r collecting overdue coin. In fact, a successful collecon policy is a paramount necessity if you want to keep d accounts cleaned up.

"I used to rack my brains and scratch my head for st the right kind of an entering wedge into the cusmer's pocketbook, and so one day when I was hard essed for ideas I got together everything I had ever ed in the way of catching old accounts on the wing d bringing them down to earth. I sifted this material til I had what I conceived to be the best plans for winng results.

"Each step in my collection chain is aimed at drawing e from the debtor, either in the form of a promise to y soon or a partial payment, or some tangible evidence which to predicate future action. The first step in e chain is to make the statement-of-account in triplite, just as soon as it runs behind. Then, instead of iting 15 days or a month, I get busy on my delinents just as regularly as clockwork.

"The original of those triplicates is first sent out, th a statement typed on it: 'Haven't you forgotten smething? We have certainly missed it at this end—tat check to cover this account! How about you?'

"If no response comes in ten days out goes carbon cpy No. 1, with another typewritten statement: 'This your second reminder. The original reached you ten ys ago. What do you say to sending us a check in fl, or at least some on account right away?'

"If no response comes to this in another ten days, ot goes carbon copy No. 2, with this typewritten statement: 'This account is becoming mouldy in my ledgers. How about a check and starting a clean sheet?'

"Any one of this chain of go-getters can generally be counted on for some results, but supposing all three statements are disregarded, which happens in about forty per cent of these cases. It is apparent that more drastic action is required when the customer ignores these direct overtures at settlement.

"Now I begin my 'reasonable excuse' letter, which gives the customer an opportunity to pay by hiding behind a logical excuse, and without other embarrassment. I try to warm the patient up and to keep the account from getting chilled, so ten days later out goes this letter:

"Perhaps you have been sick! Or you may have been in Florida or California for pleasure! Or any of a number of things might have happened!

"If so, won't you please tell us about it, so we may know why our statements of account mailed you in the last thirty days have been so neglected.

"A check—in whole or in part, will answer my purpose, but I must get this account cleaned up soon, or at least headed in the direction of an early settlement.

"May we count on that check, be it large or small—by return mail?"

"Generally, this brings a response from the remaining forty per cent. Seldom does this letter go unanswered from that sheaf of stale accounts, for the debtor is given a cloak under which to hide his delinquency. Any reasonable excuse will suffice. What we want is the cash along with it. And if that does not come we keep the debtor warmed up again when the next ten day period rolls around, those who still fail to respond getting this letter:

"Sending you statements of account—

"Writing you letters asking for money—

"It's out of my line—I'm a business man, not a lawyer or a collection agency. I don't like it at all, any more than you like to receive them, but something has got to be done about this account. Either you have to pay it up or I have to pocket the loss—and I'm certainly not going to do that without taking the matter to court.

"Why not save me this disagreeable task of writing you letters or driving me to making actual threats. I don't want to do it. It's not good business. But you are driving me to it!

"Now, naturally, I'm going to do one of two things—but you can save all that by sending me a check now in whole, or in part. What do you say?"

"If no response is received—yet here again we always get our percentage of replies—the time is now shortened to five-day periods, in order to cut down on the psychological paying resistance of that particular debtor. It is only another aggravated case of constant dripping wears away a stone. And it's all done in this same pressing vein—no hard-boiled collection method—no severe business-like tone to it—only friendly conversation, aimed to getting under the skin of that debtor and making him come across.

"The trouble with most business men is that they lose patience, grow exasperated and wax eloquently pro-

The Story of Acidophilus Milk

As Told in a Monthly Bulletin Issued by the Chicago Department
of Health, Herman N. Bundesen, M. D.,
Commissioner and Editor

CIVILIZED man is always on the lookout for something that will keep him young. Once a deluded Spaniard named Ponce de Leon came to this side of the world to look for the fountain of youth, the waters of which would make one forever young. But he failed to find it. There is no such thing. We can no more prevent old age than we can stop the march of Time. But we can defer old age. According to nature's law, man lives an average number of years. The Bible says that three score and ten, or seventy years, is the usual life time of man.

As scentists began to study the human body, however, with a better understanding of the life activities and functions of the vital organs, effort was directed to preventing premature decay and avoiding pain and discomfort rather than to making futile attempts to attain perpetual youth. Medical knowledge today has shown that many ills are due to abuse of our digestive organs, and that if there is any mope for an easy, painless, long life, it lies in preventing the formation of poisons in the bowels.

HERES TO YOUR GOOD HEALTH
ACIDOPHILUS MILK

The Digestve Tract.

Man lives by eating and his condition in life is dependent on food. But he may also die by eating. The process of digestion is one of the most interesting studies to be found in human physiology. A proper understanding of digestion is necessary for a profitable and intelligent consideration of food as a source of health or disease. Let us first then consider the structure of the digestive organs.

The fountain of youth resides within yourself.

Keeping young is a matter of thinking, feeling, and acting.

If you eat rightly and throw off wastes properly you need not go to Florida looking for fountains.

Bad health habits reduce vital resistance.

To those who need it, there is a way of changing the germs of decay to those of youth and health.

Acidophilus milk implants health germs that are normally in the intestines of every person who lives rightly.

Acidophilus milk is also an excellent beverage and a nutritious food.

Extending from the mouth to the rectum, man's digestive or food canal is about thirty feet long. It consists of many special organs. The structure of the various portions is very similar throughout, consisting o supporting tissue, several layers of mucles, nerves an blood vessels. The digestive tract is lined with a specialized membrane in which are thousands of small gland that secrete digestive fluids. The organs of digestion ar five in number, the mouth, the stomach, the liver, th pancreas and the intestines. These organs secrete different digestive fluids that act upon the food and modif it so that it may be readily absorbed into the body.

The intestines in man consist of the small and larg bowel. It is with the large bowel, or colon, that this article is principally concerned. The large intestine is th human sewer; in it is found the waste food material tha is ready to be discharged from the body. The process o digestion still goes on, to a certain extent, in the colo and this organ also has absorptive powers.

The Germs in the Intestinal Tract.

The digestive tract contains enormous numbers o germs. We swallow them with our food, and, whil many germs are killed by the digestive juices, man others pass through to the colon, where, under favorabl circumstances, they increase enormously in number. Mos of the germs found in the intestinal tract of the norma person are not disease producing, or if they are of tha variety, are effectively resisted. The most common (the germs in the large intestines are those that putref the contents of the bowel. Various digestive disturbances may increase the number of bacteria. Excessiv eating brings increased food and a tendency to constipation, both of which favor the multiplication of germs an the formation of poisonous putrefactive substance Since the colon has absorptive powers, it is easy to se that these poisons may be passed into the blood strea to poison the whole body.

Studies of these germs have shown that the harmf germs found in the intestinal tract can be successfull replaced by drinking milk cultures containing a favo able germ called bacillus acidophilus. This germ, (bacillus, is a normal habitant of the lower intestinal tra of man, but under ordinary conditions of modern diet is present only in small numbers. It is present in lar numbers in healthy infants while on a milk diet.

Acidophilus Milk as an Aid to Bowel Trouble.

The bacillus acidophilus, cultured in milk, makes type of milk that is particularly palatable, thus inviti the use of milk by those who might otherwise decline use this wholesome food. The use of milk artificial soured by acid-producing germs is not new. It has be recommended by physicians and practiced among t people for a long time. The question as to whether brings about a beneficial effect is answered by investig tions of Rettger and Cheplin, who state that milk c tures of the bacillus acidophilus have been proved eff tive in changing the types of intestinal germs in ma he bacillus acidophilus has been used with good results the treatment of intestinal troubles and in chronic nstipation.

Aside from its value as a remedial measure, acidophus milk is an excellent beverage, and a food which has l the nutritional properties of milk. It is a complete od and may be used in large amounts, constituting in me cases the entire diet for a few days until the intesnal germs have been changed. Thereafter, its continued se in small amounts will maintain the acid-producing rms of the intestines. The product has a pleasing odor d agreeable taste.

How to Drink Acidophilus Milk.

For adults the amount of acidophilus milk recomended at first is one quart daily. After the first few ys, this amount may usually be decreased, but some ses may require this quantity to be continued, or even creased. The following scheme of dosage has proved eful: Take one quart of acidophilus milk daily for the st three days, and one pint daily thereafter. The milk may be taken at or between meals, according to individual preference. While taking the larger quantities, it may be desirable to reduce the amount of other foods. According to some authorities, the best results are obtained by taking acidophilus milk with the meals, preferably some with each meal. The idea is to mix the living acidophilus germs thoroughly with the food. A glass of acidophilus milk with each meal usually gives good results.

ACIDOPHILUS MILK
DRINK IT DOWN DRINK IT DOWN
KEENAN

Defying Age.

It seems certain that the use of acidophilus milk does no harm and, if the results are favorable, then here is an easy way of prolonging life, preventing disease, and warding off old age. Dr. Arthur I. Kendall, formerly dean of Northwestern University Medical School, is of the opinion that the successful changing of germs of the colon from a poisonous to a non-poisonous type, and thereby preventing putrefaction, would probably add ten years to the average span of life. While the bacillus acidophilus is not held out as the "fountain of youth," or as a cure for all ills of man, nevertheless, if ten years can be added to life, free from pain and discomfort, then by all means let us give it a fair trial.

BREAKAGE OF BOTTLES IN MILK PLANTS.

Milk Plant Letter No. 147, U. S. Bureau of Dairy Industry.

One of the big items of expense in the milk business is the cost of replacing bottles which have been lost or broken. It is well known that the cost of replacing lost bottles is great, but the enormous loss from broken bottles is not so generally realized. Preliminary studies which have been made indicate that the total breakage in the plants in the United States results in a loss of several millions of dollars annually. From five to ten days were spent at each plant, and the glass was collected from various points—as far as possible from such points as would tend to show the effect of various pieces of equipment on the amount of breakage.

The figures in the table are the averages for each plant for the whole period, and are arranged in the order of the average total breakage per 1,000 bottles filled. It will be noted that there is a great variation in the total breakage per 1,000 bottles filled, as well as in the breakage at various points. At each plant a detailed study was made of the arrangement of the equipment, methods of transferring the bottles from place to place, temperatures used in washing solutions, etc. This study was supplemented by a drawing showing in detail the plant layout and the route of the bottles from the receiving platform through the plant and out to the delivery wagons again. From this information we are able to determine what effect, if any, on the bottle breakage is indicated by the plant arrangement.

In plants at the top of the list the bottles passed in a continuous movement from the checking-in platform through the washers and fillers to the milk storage room. Conveyors were used almost exclusively in transferring the bottles from place to place, with only a very small amount of handling in a few plants.

In the plants near the foot of the list considerable trucking and handling were generally done. At plant No. 13, for example, much handling was done between the checking-in platform and the bottle washer, while a good deal of trucking was done between the bottle washer and the fillers. In the cases of plants Nos. 2, 8, 10, and 11, the bottles traveled up and down on more than one floor, while at all the other plants on the list only one floor was used in the passage of the bottles from the checking-in platform to the milk storage room.

Breakage of Bottles in Thirteen Milk Plants.

		No. lbs. broken glass per 1,000 bottles filled(1)					
Plant No.	No. of bottles filled daily	At receiving platform (includes route breakage)	At feed end of washer	At discharge end of washer	At fillers	In milk storage room (includes checking out routes)	Total
1	4.802	1.9	...	2.8	5.5	...	10.2
2	42,369	...	1.2	.3	4.7	4.4	10.6
3	60,968	1.8	3.3	...	3.9	2.3	11.3
4	13,536	...	...	...	... (2)	...	12.0
5	62,096	2.2	2.8	1.7	3.6	1.9	12.2
6	27,719	2.5	.9	...	7.9	1.1	12.4
7	44,463	1.5	4.0	1.7	4.7	3.0	14.9
8	89,805	3.5	3.2	4.7	3.1	3.2	17.7
9	51,197	2.7	3.7	6.0	4.2	1.2	17.8
10	160,540	2.0	9.7	2.4	1.9	3.2	19.2
11	97,983	4.6	3.0	...	11.3(2)	.5	19.4

13	42,227	8.9	1.3	6.1	5.4	5.3	27.0

(1) The number of bottles broken is slightly less than the number of pounds. On the average, the weights of the bottles were 1.6 pounds, 1.0 pounds, and 0.6 pounds for quarts, pints, and half-pints, respectively.

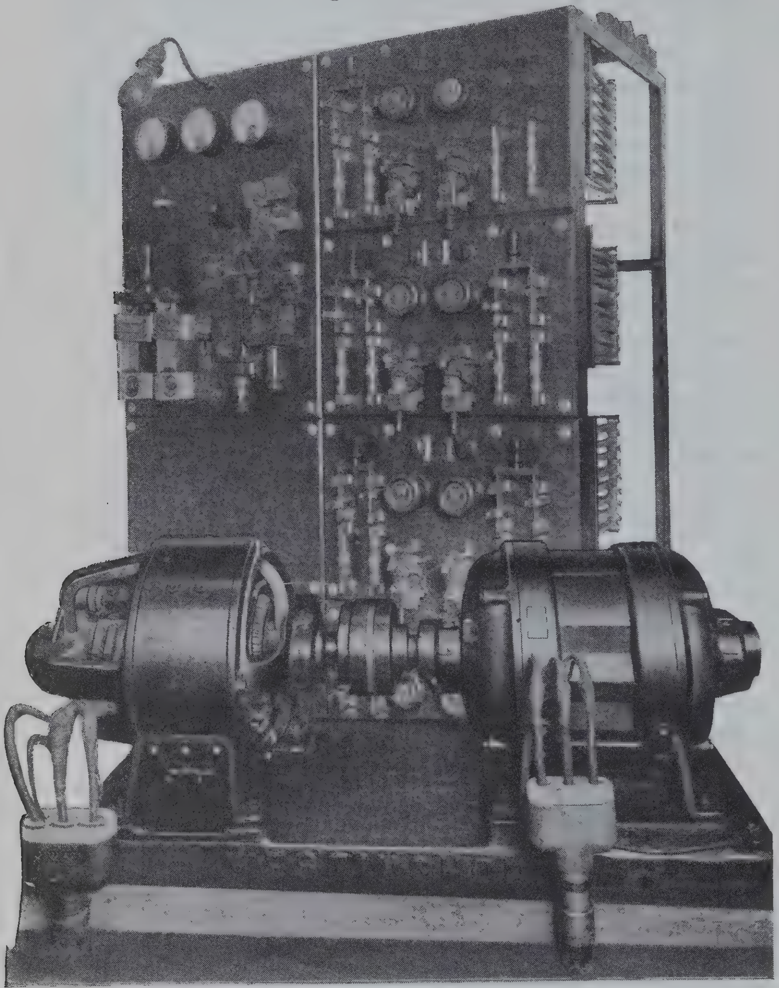
(2) The glass collected at the discharge end of the washer is included in this figure.

Selection and Operation of Battery Charging Equipment

Increasing Use of Electric Trucks in Dairy Plants Makes This An Important Subject. Be Sure Your Plant Superintendent Reads This Interesting Article

By H. E. SHINKLE*

THE steadily increasing use of the electric truck is an indication that the business man is gradually recognizing its economic value. It is a proven fact that in its sphere of operation it is the most economical kind of delivery equipment. The way to handle a study of the electric truck is to consider it as transportation, and analyze every item of expense. It has been the custom heretofore to regard this part of he business as a necessary evil, although it enters as a big factor in the gross cost of doing business.



The self-evident advantage which the electric truck enjoys is frequently overlooked. The life of any machine is measured by its running time and not by its idle time. Depreciation during idle time is small. An electric truck stops in every part whenever the wheels stop—at crossings, in traffic jams, and for each house-to-house delivery. It requires no cranking, starts instantly, picks up very rapidly, and is depreciating only when doing work. The electric truck, with its normal depreciation rate of 5 to 10 per cent, is merely reflecting the advantages of its instantaneous application of power.

Simplicity is one of the outstanding features of electric trucks. This should also be characteristic of charging equipment. Just as the manufacturers of batterie are striving to simplify the operation involved in carin for the batteries, so the designers of charging equipmen are striving to simplify its construction and operation.

There are, in general, three methods of charging storage batteries, i. e., constant current, constant potentia and modified constant potential—constant current an modified constant potential methods finding by far th greatest field of application. While it is generally admitted that either type of battery can be charged by an of the above mentioned methods, when properly applie it is a well-recognized fact that best results are obtained with Edison batteries when charged by the constant current method and with lead batteries whe charged by the modified constant potential metho These particular methods, when applied to their respective batteries, seem to co-ordinate the important facto of time, temperature and charging rate to produce t most economical charging equipment, as well as be service from the battery, both from an operating a maintenance standpoint.

The constant current method of charge is particularly applicable to Edison batteries. When a number batteries are to be charged simultaneously, a variable resistance is placed in the circuit, so that an attenda may adjust the current at least once every hour to value corresponding to the normal charging rate of t battery. This normal charging rate is the same as t 5-hour discharge rating of the battery.

Time Required for Charging.

The length of time required to complete the char to the charging period. A batery which has been o to the charging period. A batteryy which has been o partially discharged prior to the charging period sho be charged at the normal rate until the voltage rema approximately constant for a period of about 30 minu This is particularly true of an Edison battery in wh it is not possible to determine the state of charge other methods, since the specific gravity of the electrolyte does not change from a fully charged to a fully charged condition. Edison batteries may be boosted at rates higher than normal for short periods of time provided the temperature of the battery does not exceed 115 degrees F.

Where only one or two Edison batteries are to be charged at a time, the most satisfactory method or charging is to use a generator with constant current characteristics (differentially wound), which insures practically a constant current from start to finish of charge. These generators are designed so that either one or two batteries can be charged in series.

Lead batteries, when charged by the constant current method, are charged at a fixed rate (known as the start-

n the largest milk plant west of New York —a New Series DeLaval

The new Mayfair plant of the Bowman Dairy Company, Chicago, is said to be the largest milk plant in operation west of New York City. Equipment has been selected with extreme care, especial attention being given to sanitary features, dependability and economy of operation — with past performance in other plants as the yardstick.

A New Series De Laval Separator is installed because

—Reports from operators show that these machines skim to 1/100 of 1% (Babcock) with milk at normal separating temperature;

—They produce high quality cream of exactly the desired density—particularly important features in the milk plant;

—De Laval Separators have for many years been noted for their dependability, durability and low maintenance cost, and New Series machines are further improved in this respect.

If the New Series De Laval is better for this new Bowman plant, it must be better for your plant as well. There is a size which exactly meets the needs of every creamery, cheese factory or milk plant, capacities ranging from 10,000 pounds of milk or 12,000 pounds of whey to 2500 pounds of milk or 3000 pounds of whey an hour.

Write for full details.

Galaxy of Methods Used

Great Number of Methods of Purchasing and Bases for Establishing Market Milk Prices

By PROF. WM. H. E. REID*

THE total volume of whole milk produced during the year of 1925 was 116,505,395,000 pounds, of which amount 46.89 per cent was used in the manufacture of creamery butter, cheeses of all kinds, condensed and evaporated milk, powdered milks, ice cream and several other by-products of milk. Of the remainder of this enormous amount of milk 46.62 per cent was utilized for household purposes, 3.47 per cent was fed to calves, and it is estimated that 3.00 per cent was wasted. The 46.62 per cent of the total volume of milk utilized for household purposes was marketed in quarts, fractions of quarts, or in bulk. The total number of possible consumers of whole milk produced who reside in the United States, be it consumed as fluid milk or in the form of a milk by-product, was 115,378,094.

The production and marketing of whole milk, especially when the volume produced is almost unbelievable, represents a vast economic problem. One of the outstanding phases of this problem is the methods practiced in the purchase of the product.

Primitive Methods.

When this country was sparsely populated many families kept cows of their own, a practice which continues to prevail in many of the small towns of today. Many of these families who did not own a cow of their own would procure the small amount of milk needed from a man who lived in the country, and who would deliver his milk in town, his patrons coming to his vehicle with their own receptacle to obtain the mlk. This procedure of marketing milk could not be said to be conducive to a large consumption of milk of a high quality. The most undesirable feature of this practice was that it was often difficult for people to obtain a satisfactory milk supply. As a result of this difficulty new methods of marketing and methods of payment for milk were inaugurated and developed. Some of the more progressive people who kept cows and sold their surplus of milk soon saw the advantage of marketing their product at a profit and began to deliver their milk to the neighbors instead of causing them to come for it. From this primitive beginning our present day milk dealers and distributing plants, having innumerable routes, have been established.

The question of arriving at prices satisfactory to all concerned has been the cause of more trouble, misunderstandings, and ill-feeling than any other one question in the entire milk industry. The basis on which dealers and producers proceed with their business relations varies, as there may or may not be a written or verbal contract between the two parties.

The former practices which invited considerable friction between the dealer and producer have been almost entirely eliminated, particularly among the larger buyers of milk. Many smaller plants continue to a limited degree to tolerate methods which are quite one-sided. The old practice of the dealers notifying the producers either by mail or by simply posting the price in a conspicuous place in the plant or at the station and giving the producers a limited time in which to sign the contract has, in a large measure, been discontinued. More modern procedure is for the representatives of the dealers and p ducers to meet at definite intervals when the price f the succeeding period of time are to be carefully det mined.

How Milk Prices Are Determined.

The number of systems used in buying milk and arr ing at prices throughout the country is innumerab However, the different bases followed can be said to few. Without question the basis, as set forth by t bureau of markets, and which limits itself to sev classes, is very practical and is to be recommended. Th are as follows:

1. Agreements based on consideration of probal cost of production and the available supply in relati to the estimated market requirements.

2. Prices based on previous months' price of chee in some primary cheese market, with an additional allo ance for the extra cost of production of a high qual of milk, plus the estimated value of whey for farm fe ing purposes.

3. Prices based on previous months' price of butt in some important butter market, either with or with separate allowance for special quality of milk, and som times an arbitrary allowance for variations in seaso cost of production.

4. A combination of two and three prices beg based on both butter and cheese prices as shown by agreed-on quotations for a period of a month preceding the date of the announcement of prices to be paid milk in the ensuing month.

5. Same as No. 3, except that the current prices of butter is used instead of the previous months. For this reason the milk prices cannot be determined until sev- eral days after the end of the month in which delivery of milk is made.

6. Prices based on net return to dealer.

7. Prices contingent upon the prevailing prices of milk in some large centers of consumption, or at various condenseries, cheese factories or milk stations supplying some large market.

Basis of Payment.

The practicability of these classes is apparent when one realizes the frequency of their use. They are impartial and assure justice to those parties who may be concerned. Several of the classes require that the dealer and the producer, or their representatives, must familiarize themselves with the butter, cheese and condensed milk markets, in addition to their knowledge of market milk. The estimable value of all of these classes lie in the fact that almost regardless of the location of a market milk plant one or more are applicable.

Milk prices paid in different parts of the country can be compared only with difficulty because for the most part the basis of payment is for the different unit in the different sections. In past years the system most commonly practiced was to purchase milk by the an. gallon or quart, but this practice, having been proven inaccurate, has been almost entirely superceded by systems that are more reasonable and have assurance of issuing justice.

Good Housekeeping Institute
Good Housekeeping Magazine

DOWNING BROS., Rock Island, Ill., have been using Thatcher Superior Quality Milk Bottles for over ten years and Thatcher Posters on wagons and windows for over two years. Did this policy pay? Read the following:

> *"By increasing the public interest in milk from a health standpoint, Thatcher National Advertising in The Saturday Evening Post and other magazines has proved a valuable aid to us. The best proof of this lies in the fact that our sales last year increased 25% over the preceding year!"*

The above is typical. Everywhere, dairymen are finding that Thatcher advertising helps build greater milk sales. Make your sales "jump" by tying-up to Thatcher.

"MORE TRIPS PER BOTTLE"

The most important item in buying milk bottles, is the final cost per bottle to you. The first cost or purchase price means little or nothing to you. From the actual experience of dairymen and from exhaustive laboratory tests, it has been definitely proved that Thatcher Superior Quality Milk Bottles will give you more trips per bottle. For Thatcher Bottles are tougher, more uniform in quality, have a better distribution of glass, and consistently perform better in actual service than any other bottle made.

Specially designed lehrs, used exclusively by Thatcher, help to give Thatcher Bottles that Superior quality and wear-resisting toughness not found in ordinary bottles. The Thatcher Trade-mark is blown on every Thatcher Bottle for your protection and guarantee.

Then too, millions of milk users see and read the celebrated "A Bottle of Milk Is A Bottle of Health" advertisements of Thatcher Bottles in The Saturday Evening Post and Good Housekeeping Magazine. If you want to increase your milk sales, fill in and mail the attached coupon. It will pay you to act at once.

A question of Battery Characteristics

Why is it that by far the greater proportion, *nearly four-fifths,* of all industrial truck and tractor batteries now in service are Edison nickel-iron-alkaline Batteries?

Business executives are not interested in technicalities. Performance alone counts—and the performance of Edison Batteries is the factor that has given them leadership.

The facts are these. From the starting whistle in the morning until the last rushing moments of a busy afternoon, Edison Battery propelled trucks go about their work with the full vigor and power required of the job. That is the first essential. Actual tests have proved that Edison Batteries not only haul more tons, more trips, but do it in faster time.

Added to this, their long life, low cost per ton-mile, and the ruggedness of their steel construction, resisting shocks greater than any other battery could withstand; make the Edison Battery by all odds the favorite.

Advantages of Right Sort of Partnership

Is Your Partner a Help or a Hindrance? Are You the Same Kind of a Partner? Relatives Make the Best Partners

By H. R. SIMPSON

ONE of our modern humorists—we forget which one—told of two partners, one a tight-wad, who walked home at night to save gasoline or carfare, and the other a good fellow, "who would give his last nickel to a pan-handler." The partners prospered. It was the wonder of the town how the two managed to hit it off together, but they did. And they made money, heaps of it.

Each of these men tired of the **status quo,** after a time dissolved partnership, each for a few days happy to be in entire control of his business. For each the millenium had arrived. Each believed his own attitude toward the public to have greatest effectiveness for profits. The first started out to follow his hard-boiled course to the limit. The second began equally hilariously to indulge his good-fellow propensities.

And, of course, in the story, both businesses went to smash. Divided, the partners fell.

You cannot compress into a single epigram or two all of the psychology of partners and partnership in business. As a starter, however, the principle demonstrated by the story just narrated, carries the investigator a long way. That story is diabolically true to life. Many men in business who, individually, would fail of any considerable success go a long way in double harness with the right man. Picking the right man, however, is as difficult—some will say more difficult—than picking a wife. Initially, one of the principles of matrimonial partnership seems to apply—the principle that unlikes team up best. The wit says that that principle is true except when it isn't.

Nature, in her wisdom, tries to keep the human race somewhere near a given level. The attraction of like for unlike in mating prevents the development of many widely separated, abnormal human types. Tall husbands and short wife, high-strung mother and unemotional father, and many other combinations of opposites are every-day matters. We see the principle many times working out very nicely. Possibly, one explanation of attraction of opposites is the tendency of humans to put a low valuation on qualities they possess, and a high one on the qualities they lack.

Aside from the fact that opposites psychologically are apt to be happier with each other than likes—an important consideration in choosing a partner for business—there are strong business reasons why opposites pair up well. If two partners are closely alike, the business management probably has a surplus of certain quality and certain kinds of ability, and also a lack of certain others. In the story, one partner was a close buyer, a careful manager; he overruled many impulsive and disastrous moves which the generosity of his partner would have involved the business in. On the other hand, the good-fellow traits of the partner were of wonderful benefit in making business friends for the business.

Where there is but one executive head of a business, not one, but a whole string of qualifications are required. The manager needs to be a good office-manager, a skillful buyer, a good salesman, a successful credit man and an efficient handler of help. In a single individual, these several abilities are nearly always present unequally. It is just right here that the partnership idea works out so well. White may be a poor credit man, but the business is safe so long as his partner, Black, is a good one.
Green may be a poor hand at handling help an
pleasing the public, but the store will prosper if Gr
ability in buying is supplemented by his partner Bro
qualifications for supervising an organization and
chandising.

The foregoing are not only arguments for pic
the right sort of partner. They are cogent reason
carefully considering the partnership system of busi

Some Rules for Partners.

It has been our observation that partnership
sisting of father and son, and of brothers, are
likely to be permanently successful. There is a pro

youth alone is apt to make mistakes and overloo
portunities. Teamed up in a business partnership
may accomplish wonderful results. Men of the
nationality make better partners than do aliens.
planted men, as Elbert Hubbard called them, often
up especially well, if from the same district or sect
the country. Probably, a common ground furnish
such other things as the same Alma Mater, or the
fraternal affiliation, helps. We may look for opp
in business partnerships, but we musn't forget that
also must be common ground.

The Forming of Ill-Advised Partnerships is as Fri a Cause of Business Failures as the Selection Unsuitable Business Locations.

Business partnership is a mighty intimate
Relations between buyers and sellers in business
cold-blooded; we expect many of them to be so.
tions between business partners cannot be cold.
and again men attempt partnership with partie
do not like, maybe secretly dislike, or despise.

orance, they think they can beat the game. There is safe foundation for twenty-four-hour-a-day business tnership, except the genuine liking and friendliness he partners for each other.

Even with the best of good feeling existing, disagreent and misunderstanding are bound to come. For ny things, partners require to have implicit confidence one another. Time and again one partner must cone ground out of consideration for his "side-kick." rriage without love is no more dangerous a thing than iness partnership without liking. Where one partner silent, it is, perhaps, true that the qualification of sonal liking is not so indispensable. Still, it should st. Speaking of silent partners, general experience rly points out several common dangers.

One of these two conditions should exist: either, the nt partner should have an excellent understanding he particular business, or the working partner should capable of efficiently selling his backer on ideas. usands of intelligent, capable young fellows, who e interested outsiders in backing them, have discovl to their sorrow that the battle only started when much-wanted capital was secured. Nothing can more ctively throw bricks into the machinery of a business erprise than the harping criticisms and incompetent gestions of a "silent partner who cannot be sold on s by the working partner, and continually insists on intruding himself into the management." Lack of knowledge of the business need not be of serious consequence, of course, if the working partner has the whole confidence of his backer and has no difficulty in getting his consent and support when questions of policy are up for decision.

The acts of one partner are binding on the other, and either is responsible for the full debts of the partnership. A business man who has entered partnership without the necessary discretion may find himself in the position of the man on the tail of the kite. He can't let go, yet every moment he gets higher, farther and farther from earth.

Business divorce can be as disagreeable and expensive a process as divorce between husband and wife. The modern way of establishing virtual partnership with a reduction of the peril is to use the corporate forms in doing business. Here the liabilities of individual partners is definitely limited. Incorporation also facilitates frequently the not too expensive withdrawal of a partner from the business. It also is a great little device for taking care of the ambitious, efficient employee who is hungering for a business of his own. It becomes a very simple matter to take him into the business.

For the reader contemplating a business partnership, our concluding word will be one of caution: whatever you do, be careful!

The Control of Butterfat

Efficient Follow-Up System Necessary When Buying on a Butterfat Basis

By C. L. TURNER*

SOME instances, cost systems more or less efficient, have been devised and installed in the dairy and milk product industries, and while very necessary data btained therefrom, it has been found that even in e instances no attempt has been made to properly rol butterfat.

profit and loss statement and statement of assets liabilities merely show the earnings and financial ion of the company, but the derivative of the profits erlooked. Milk is bought on a butterfat content basis therefore an efficient follow-up system of this item cessary.

Not An Expensive System.

t is contended by those who do not favor a system ntrol of butterfat that it entails a considerable exe to keep such a control, but it has been found from rience that this is not the case should a system be wed somewhat as follows:

hen the farmer is paid for his milk on a butterfat , it is known at the end of each month the number ounds paid for and the butterfat composite test of. This information being available, the total ds of butterfat received can readily be ascertained. e same way purchases from dealers and commission s are paid for on a butterfat basis and total butterounds from this source also can be readily ascerd. Similarly butterfat content of butter is obtainso that should the laboratory tests be accurate the butterfat purchases for a given period are available.

he total quartage of each commodity sold is known, rom the daily standardization charts, the butterfat nt of each grade of milk and cream sold can be lated.

By taking an inventory at the beginning of the period and converting same to a butterfat basis and adding thereto the total butterfat purchases and deducting therefrom the inventory in butterfat units at end of period provides total butterfat to be accounted for. The sales in quarts being known and the tests at which the commodities were sold also being available gives the total butterfat pounds sold, and therefrom can be learned how much butterfat loss has been sustained during a period.

Possible to Trace Leakage.

In cases where receiving stations are maintained it is possible to trace leakage of butterfat as beween these receiving stations and the main city plant. By the installation of a butterfat check in reference to milk received at country receiving stations it can be readily ascertained if the farmer is being paid on a greater butterfat test than he may be entitled to. From experience it has been found that the testing of milk at country receiving stations is not any too accurate, and great saving has been effected through the adoption of butterfat control at each outside receiving station.

It is surprising what a vast amount of interesting information can be obtained by the installation of a butterfat control system. A check is obtained on the butterfat content of the commodities sold and the laboratory and standardizing departments can be held accountable for any product being sold with a greater butterfat content than is necessary. Every pound of butterfat lost through overstandardization means a loss in dollars and cents, and as plant expenses are in almost all cases controlled, it is equally as important to have an efficient control of butterfat content of the product.

The Milk Plant Superintendent

The Peculiar Abilities that are Necessary for Success in Managing a Modern Milk Bottling Plant by One Actually Doing It

By H. W. VETTERLEIN, Utica, N. Y.

TO MAKE a city milk plant a success, a good, safe milk for the consumer, day after day, is essential Much depends on the plant superintendent. He must be a good judge of men. Labor turnover is a large item of overhead expense, and the plan superintendent must know who to hire and also who to fire. If he can get a good bunch of men, and hold them, the profits will be much greater than where there are many changes. It costs a large steel company about one hundred and twenty-five dollars to hire a laborer and break him in to do a job well. I often wonder if it isn't nearer five hundred dollars in the case of a milk plant man. The superintendent must be able to pick the man to do a particular job in a large plant. One man might be valuable on the receiving platform, and still not make a success in any other position.

Of course, in smaller plants, one man usually does a number of different things, in the day's run, so it is up to the superintendent to get men that can make good at any job in the plant. A superintendent must not be afraid of hard work, because it often happens that when a man is off on account of sickness, he should be able to take his place. He must be able to handle men, hold their respect, and get them to do their best. He should thoroughly understand all operations, so as to instruct beginners in the right way.

Indiscriminate hiring and firing is bad business, and has been the cause of some firms going out of business, or at least not making much profit. He must know when a man is worth more money, to hold him, because if you can keep a good man, year after year, it is better for all concerned. He must also know when a man begins to feel too important, and asks for more wages than he is worth, because any man can be replaced by one as good or perhaps better. So it is just as important to know when to let a man go as it is to hang onto him. It all depends on the size of the plant and the number of men employed as to whether the superintendent should have daily manual labor to do.

In some small plants the superintendent takes in the milk, pasteurizes, makes buttermilk, etc., but he is really a working foreman, while in large plants he has a foreman under him.

I believe the foreman should do the testing and standardizing of milk and cream, unless there is a man that can be absolutely relied on, because much trouble can be caused, and money lost, by incorrect standardization. The superintendent should check up on this often. He must thoroughly understand refrigeration and be able to do repair work. If a plant has a good foreman, the superintendent with a helper can do all of the repair work. Of course, in very large plants, he wouldn't have the time to do much actual labor. He should make reports of the day's operations, such as milk received, separated, bottled, sold, butter made, etc. Also look after the supplies of bottles, caps, brushes, repair parts, and keep enough on hand. He must know how much alkali to use in washing bottles to do good work and still not waste any. Also how much washing powder to use in washing up, because much money can be wasted this way. Some water is very hard, so it naturally takes more soda to soften it. A superintendent should do f quent inspection work, see that everything is clean. should keep abreast of the times, read all he can on m and put the good suggestions into practice. Also good on commercial starters, because the average da worker has hazy ideas on the subject of starters. course, there are exceptions, and in some plants, a m will know more about starters than the superintende He should be put in charge of this end because if starters are not right the butter, commercial butterm and sour cream will not be right either. He should neat in appearance, and try to have the men take pr in this respect. It is a good plan to have everyone on clean jackets and overalls every day because in average plant one day's work will soil them. A s cessful superintendent must be able to "keep his hea because some days everything seems to go wrong a the man that "flies off the handle" will never be a s cess. He must be honest, and always work in interest of his employer. Also study the buying a selling end of the game. It is a very good plan fo prospective superintendent to learn the milk busi from the ground up. Some of the best superintende were raised on the farm, entered a milk plant as hel pursued a course in a good dairy school, and gradu worked up.

A four-year dairy course is excellent, but not ne sary to success. A two-year course is much chea and some successful milk men have only had the adv tage of an eight or twelve weeks winter course, wh some very successful ones never saw a dairy school

As bacteria plays such an important part in the r game it will help a superintendent very much to get he can on bacteriology and the dairy school or colg is the place to get it. Milk with too high bacteria cou should be rejected at the receiving platform and a su intendent can often tell the farmer how to lower h count. Everything that the milk touches in the p should be absolutely sterile. A superintendent sh know how to get a low count in the bottled milk, h be able to show the men how to do it.

Experience, and plenty of it, is what counts; an a I said before, a dairy school course is good, but not ne essary for all. So it really depends on the man. Ex perience in different plants is very good, but not essen tial. There are successful superintendents in plant i which they started as helpers, while others have wo in several different ones.

A superintendent should always "be on the jo" during the day's run because, as the saying goes, "wh the cat is away, the mice will play" sometimes happen in the milk plant.

To sum up, a superintendent who is conscientious broadminded, honest and a hard worker will mos al ways make good.

Need a good man for that new department of yours? You can get in touch with a lot of them through "The Milk Dealer" Want Ad Department.

Clean, lustrous, lasting white paint

Thousands of industrial plants find the superior qualities of Barreled Sunlight an actual economy in interior painting.

REG. U.S. PAT. OFF.
Barreled Sunlight
THE RICE PROCESS WHITE

at the lowest cost per sq. ft. of surface covered

A CHECK-UP among hundreds of industrial plants has shown that Barreled Sunlight does the finest possible job of interior painting—and does it *at an actual saving.*

The labor cost of application is less because Barreled Sunlight, containing no varnish, flows on freely with brush or spray—and covers remarkably.

Repainting costs are far lower, too. Once on the ceilings and walls, this paint is good for years of service. Its smooth surface *washes like tile*—and frequent washings will not wear it away.

Made by the exclusive Rice Process, Barreled Sunlight is guaranteed to remain white longer than any gloss paint or enamel, domestic or foreign, applied under the same conditions—also not to flake or scale if properly applied.

Plant lighting is always improved with Barreled Sunlight. Its lustrous surface reflects just the right quantity and *quality* of working light—free from glare.

Barreled Sunlight is sold in 55- and 30-gallon churn-equipped steel drums, and in cans from ½ pint to 5 gallons. Where more than one coat is required, use Barreled Sunlight Undercoat first.

Use the coupon to obtain illustrated booklet and panel painted with Barreled Sunlight.

California Milk Dealers Meet in Oakland

Sixth Annual Convention Held in Connection with Pacific Slope Dairy Show

THE state of California Milk Distributors' Association held its sixth annual meeting on Thursday, November 18, at the Civic Auditorium in Oakland. The state was represented with about 60 members of the association, this number augmented by a few visiting delegates from other Western states who had come to attend the Pacific Slope Dairy Show.

President D. M. Dorman of the Crescent Creamery Company of Los Angeles and Secretary Fieweger of Oakland arranged for an interesting program of topics of general interest.

H. A. Walsh, secretary of the Southern California Milk Dealers' Association, Los Angeles, spoke of the adoption of the universal bottle by the dealers in the vicinity of Los Angeles. The universal bottle was discussed at the convention last year, but then it had not been in use a sufficient time to prove its success.

All new bottles are purchased by the members upon requisition of the association, and from bottle manufacturers who are licensed to make them. Each member is required to furnish a record each month of all bottles used, and by comparing the number purchased with the number used, the association determines the number each dealer should buy to maintain his average or pro rata.

Discuss Universal Bottle.

It is necessary to keep an accurate record of purchases in order that each member buys his own share of the whole. Dealers who buy less than their share, according to the reports and records available, are liable to lose their membership in the association, and lose the privilege of using the universal bottle.

In the selection of a particular type of bottle, standard specifications are observed. This has eliminated different size caps, and milk appears to have a uniform cream line in all the bottles.

The universal bottle used by the Southern California association has a No. 2 cap seat, and is identified by the symbol of the Southern California Milk Dealers' Association, and a series of dots around the neck, and a double cross at the bottom. This bottle is easily distinguished in a case. It is registered in the state and county, and the bottle exchange has full authority to prosecute any person using it who is not licensed to do so. The members in turn, are not allowed to use the bottles of any one not a member of the association, or others.

Benefits derived from the use of the universal bottle cannot be determined in cold figures, according to Mr. Walsh. The association has had considerable effect on the milk dealers from an ethical standpoint, and has probably paved the way for other co-operative work, such as advertising, which may be taken up in the future.

The average number of trips for each bottle has been considerably increased, over that of the privately owned bottle. Including the three classes—wholesale distributors and those having both types of business—the average number of trips per bottle is 33. Those doing only retail business show a very high tripage, this due, no doubt, to his having better control of his returns. Wholesale distributors' returns are the reverse. Retail dealers' bottles average 43.6 trips, while the wholesalers' bottles average only 24.1 trips.

The drivers of association members pick up all b tles at the present time, those not belonging to mem firms being cleared through the regular bottle exchan Credit of two cents is given for bottles picked up, a charge of three cents made for bottles returned to association or its members by the bottle exchange. bottle exchange is a separate and distinct organizat and it handles the bottles of both members and n members of the association that controls the univer bottle. Later on they expect to have the associat members' drivers pick up only the universal bottles.

The universal bottle was first adopted about th years ago. With one exception, the milk dealers c tinued using bottles on hand bearing their own bran but all new bottles purchased were of the standard ty Today, with 39 members, about 97 per cent of the bot used by the association members are universal bott The saving is estimated at 25 per cent to 40 per cen bottle cost, besides the time saved sorting, and the pense of clearing more bottles through the bottle change.

The discussion following Mr. Walsh's address i cated there is considerable interest in the San Fr cisco and East Bay districts in the universal bottle. T plan could no doubt be worked out satisfactorily o co-operative basis in most other localities.

Dry Milk—An Opportunity.

Dr. H. E. Van Norman spoke of the undeveloped m ket for dry milk. While the uses of dry milk h showed a remarkable increase in the last few ye there is a world of opportunity for further developm As instances, he cited the use of dry milk by taurateurs and hotel owners who are serving abou per cent of the food eaten by the American people. milk can be used to improve the quality of puddi pastries, etc.

Milk dealers can dispose of surplus dry milk to h farmers supplying whole milk. In most of the sect where dairying is intensely developed and where il is sold in its whole state, it is considered poor polic t raise calves, for the fresh milk is too valuable. bred calves can profitably be allowed to feed on f whole milk the first two weeks, then fed milk made powdered skim and warm water for a couple weeks, when they will have begun to eat dry f The dry skim milk can then be mixed with the dry thus giving the producer a market for his whole and the milk dealers a good market for the powd skim.

In Asia, Dr. Van Norman said, there is a huge un developed market for powdered skim milk. An Au ra lian firm is now shipping dry milk and sweet butt t China, reconstituting those materials to make sweet standardized whole milk, and selling it in the cie of China in the same manner whole fresh milk is old in this country. A Western milk dealer is even ow shipping powdered skim and butter to Alaska, recon stituting the products, and selling fresh Pacific Cas products in that country.

Other markets for dry milk will be found among the sausage manufacturers, who have found that the addi tion of powdered milk gives their product a better ody and flavor, and among the cracker manufacturers who anxious to find means for improvement. Chocolate npanies are now using huge quantities of dry milk, l prospects for future development of this outlet are usually good.

Experimental Work at Davis.

Dr. Roadhouse, president of the Pacific Slope Dairy ow Association, spoke about the work being done by staff at Davis and the men doing post-graduate work the university branch. They are now trying to demine the effect of feeding at varying periods previous milking upon the flavor of the milk. In some sections ere cattle are fed a great deal of alfalfa there is a pronced foreign flavor in the milk, and it was found at feeding of the alfalfa within five hours prior to lking is the cause of it. Feeding grain in connection th the alfalfa did not effect any improvement, accord- to the experiments thus far conducted, and the use silage made the feed flavors even more pronounced. me of this off flavor, however, could be eliminated by nning the milk immediately over a surface cooler. y other type of cooler did not seem to effect much provement.

Experimental work is also being done relative to the king of cheddar cheese from pasteurized milk, and us far a very satisfactory quality of cheese has been oduced. Other men are working on the use of eleccity for heating water to sterilize dairy farm utensils, th particular reference to its cost compared to the use kerosene, gasoline and the steam boiler.

Causes of sticky butter, common in the West where ich alfalfa is fed to dairy cattle, and the errors in ermining the butterfat content of milk by the Babk method are also being investigated. There is a varion of .058 per cent of butterfat in the Babcock meth- due partially to the incomplete separation of the during centrifuging, and a way of eliminating it is ng sought, so far, without success. The fat that does rise to the surface after centrifuging is partially set by the moisture that is in the fat in the neck of test bottle. Running the tester at higher and lower eds has been tried, and lower speeds have been found produce better results than high speeds. The machine s operated at such a high speed that the test bottles ke, but the tests made at a higher speed invariably wed a greater error than those run at slightly slower ed than is recommended.

Frank J. McGovern, business agent for the Milk vers' Union of San Francisco, spoke on the relationp that may exist or fail to exist between the milk gon driver and the customer. He pointed out that ployers should work closely with their employees, esially those on the outside of the plant who are not easily controlled, take more interest in their personal irs, and be very careful in the selection of men for work. Instruction of the men who are in close tact with the public, in the technicalities of the protion and handling of milk, Mr. McGovern believes, s ery important.

New Legislation.

Dr. J. J. Fry, chief of the dairy bureau of the state artment of agriculure, spoke briefly of the new regu- ons pertaining to the manufacture of dairy products, new definitions which may be enacted and be made rative in the near future. There are four of import- to the dairy industry.

One will extend the period at which milk may be held at he pasteurizing temperature to an hour, or more. In ectors now question operators whose pasteurizing te perature charts show the milk was held longer than the usual time, for some milk dealers have held at very long periods to further reduce the bacterial count of milk that was before pasteurizing, of a very high bacterial content.

In order that the people may be properly informed as to what kind of product they are buying, it is proposed to require that only the buttermilk that remains after churning may be sold as buttermilk. All other cultured milks and cultured skim milks are to be sold under another name, which will inform the buyer that it is not churn buttermilk he is buying. The names "cultured buttermilk," and "cultured milk" were proposed. Considerable discussion followed.

Cultured Buttermilk Is Discussed.

One milk dealer pointed out that it would not rectify the matter to call buttermilk made from skim milk and culture a cultured buttermilk, but would only tend to make the matter worse, for the buyer would think that cultured buttermilk is something more than buttermilk, whereas it is not even real buttermilk.

Buttermilk made from skim milk has been known as buttermilk and many milk dealers have established a good business in this commodity. Requiring that the product be marketed under another name may result in considerable loss in revenue without effecting any improvement in the product or giving the public more for its money. Cultured buttermilk, as made in most plants, has all the constituents of the genuine churn buttermilk and more. Simplifying the process of obtaining buttermilk by taking the fat out in the form of cream before the culture, or starter, is added, instead of taking it in the form of butter, cannot be considered deception of the buyer as to what he really gets when he buys commercial buttermilk.

It is proposed also to reduce the maximum bacterial content permissible in milk, before pasteurization, from 200,000 to 100,000, and in pasteurized milk from 15,000 to 10,000 or less. There was some objection to this proposal, but Dr. Fry said the department wished to make the standard for California approximately the same as that of Eastern cities, where a standard milk ordinance prepared by the United States Department of Agriculture is quite generally used.

There are to be only three grades of milk in California, if new proposed legislation is passed and made effective, as follows: Certified milk, grade A pasteurized, and grade A raw. There will be still the regular milk which may be known as grade B. This will eliminate the grade known as guaranteed milk, which is not certified, yet is close to it, but is better than most grade A pasteurized.

These rulings will not affect modified milk, and others, such as iodized milk, mineral milk, etc., the contents of which are printed on the caps.

How Los Angeles Collects Cash in Advance.

K. L. Carver of the Crescent Creamery Co., Los Angeles, told of their system of selling milk, for cash in advance. They use aluminum tokens, with holes punched in the center, in the shape of diamonds, stars, circles and squares, each one indicating a certain unit of value. Each driver employed is required to deposit $100.00 cash, and the route manager gives him $50.00 worth of the tokens. The driver sells the tokens to his customers as needed, and turns in the cash, drawing new tokens on his account when necessary.

The company demands cash in advance for all tokens sold to the drivers, and discourages drivers selling tokens on credit to their customers. A few do it, and take their chances of collecting, but, on the whole, when they learn the company would rather have them lose a customer than take the risk personally of collecting later on, they adhere quite strictly to a cash-in-advance system. Drivers are paid a straight commission of 11 per cent.

Adjustments are required occasionally when the price of milk goes up or down. Drivers are authorized to make the adjustments among their own customers, or in cases where there is a misunderstanding, the adjustment is left in the hands of the route inspector.

President D. M. Dorman discussed the advantages and disadvantages of mergers and consolidations. He believes that the merging of the interests of dairy products manufacturers is advisable, if savings can be effected in costs of manufacture, delivery, etc.

Edward F. Moran, attorney for the association, talked about "Ethics," with particular reference to moral obligations of competitors to each other, as compared to legal obligations.

New officers of the association will be elected at a special meeting to be held in San Francisco in January.

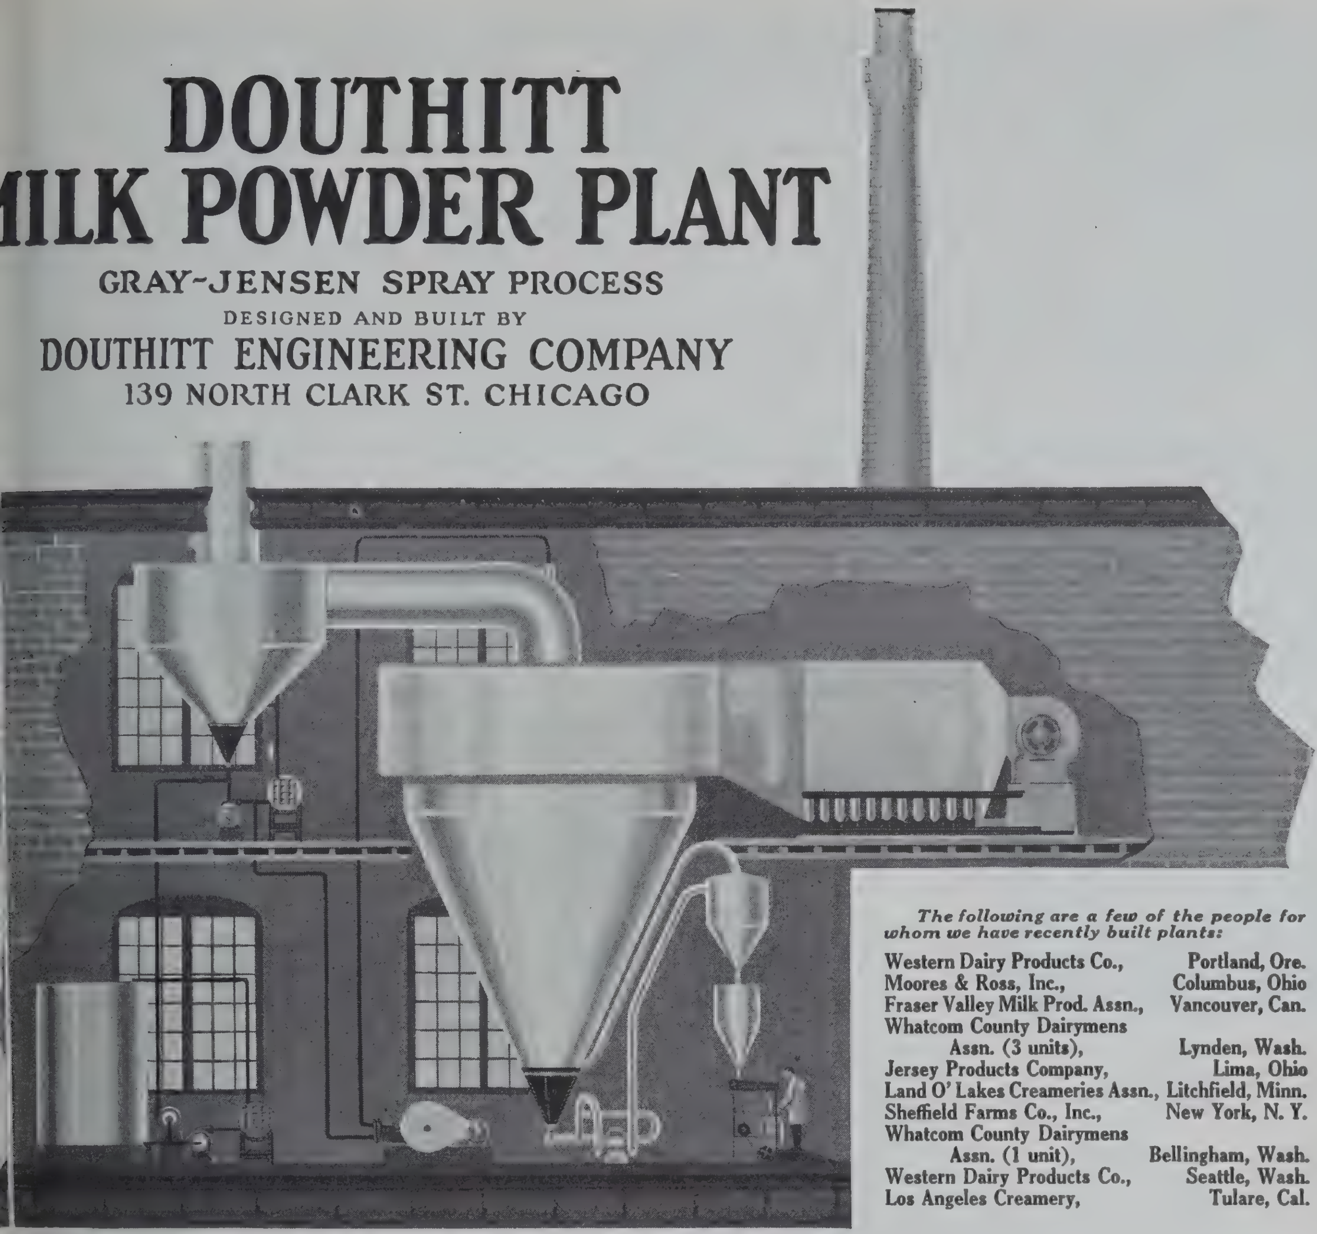
LONDON FIRM WINS AT LONDON DAIRY SHOW

At the London Dairy Show held October 19-22, fir prize, a silver medal, was awarded to George S. Clayto dealer in dairy supplies in London, for his bottle fillin machine, also a bronze medal for a pasteurizing pla display.

DOUTHITT
ILK POWDER PLANT

GRAY-JENSEN SPRAY PROCESS
DESIGNED AND BUILT BY
DOUTHITT ENGINEERING COMPANY
139 NORTH CLARK ST. CHICAGO



The following are a few of the people for whom we have recently built plants:

Western Dairy Products Co.,	Portland, Ore.
Moores & Ross, Inc.,	Columbus, Ohio
Fraser Valley Milk Prod. Assn.,	Vancouver, Can.
Whatcom County Dairymens Assn. (3 units),	Lynden, Wash.
Jersey Products Company,	Lima, Ohio
Land O' Lakes Creameries Assn.,	Litchfield, Minn.
Sheffield Farms Co., Inc.,	New York, N. Y.
Whatcom County Dairymens Assn. (1 unit),	Bellingham, Wash.
Western Dairy Products Co.,	Seattle, Wash.
Los Angeles Creamery,	Tulare, Cal.

2 Plants Operating. 6 Plants Being Installed.

WE guarantee to recover on capacity operation milk powder equivalent to 100% of the solids i the milk. No other plant can make such recovery.

o precondensing necessary. In fact, no condensing ter used. The only water required is for boilers d to wash plant up each day.

ly one man necessary to operate plant and pack wder in barrels.

e plant is easily kept in absolutely sanitary condition. It can be thoroughly washed and sterilized each day.

Easily and instantaneously regulated to leave any desired percentage of moisture in powder.

minute from milk to powder; the shortness of time during which the milk is exposed to heat insures superior quality of powder, entirely soluble in cold water, manufactured at lowest possible cost and sells for highest market price.

The powder is automatically and instantaneously removed from the drying chamber, also cooled as delivered into barrels. Other plants require from 1 to 20 hours to accomplish the same result. Milk powder allowed to remain in drying chamber until the day's run is completed becomes thoroughly mixed while being removed; therefore there is no advantage in grading such powder as the lowest quality made that day governs the grade for the day's run.

The extra recovery of milk powder, the saving in fuel, labor, and power, as compared to other milk powder plants, is sufficient to pay for one of our plants in from 1 to 3 years. Manufacturers are discarding other types of milk powder plants and installing the Douthitt plant, the life of which is from 15 to 20 years.

We will furnish a guaranteed market for all Skimmilk Powder manufactured on our plants.

Write today for booklet describing the Douthitt Milk Powder Plant.

Please Mention The Milk Dealer.

Some Reasons for Scoring Milk

Winner in Milk Judging at National Dairy Exposition is Awarded Gold Medal Offered by the International Association of Milk Dealers. Taste and Smell Most Important Checks on Milk

AT THE recent National Dairy Exposition in Detroit the International Association of Milk Dealers offered a gold medal to the winner of first place in milk judging. This coveted prize was won by Willis Porter Stoops, who will graduate this month from the College of Agriculture, Ohio State University. Mr. Stoops' home is at Wooster, Ohio, and after he has completed his graduate work he expects to enter the market milk business. Mr. Stoops submitted a very interesting article on "Why Milk is Scored," which we are glad to publish as follows:

WILLIS PORTER STOOPS,
Winner of Gold Medal Offered by International Association of Milk Dealers.

WHY MILK IS SCORED.

The grading of milk is manifestly more important than that of any other dairy product, since it is the source of all dairy products. Without a good foundation and framework any structure must fall. Therefore, good is the prime requisite of all the dairy industries, and no amount of processing can produce good milk from poor milk.

Good milk is fresh, clean, sweet and pleasing to the senses. It has no objectionable off-flavors or odors. Milk from one herd may be good one day, but decidedly off in flavor the next day. Everlasting vigilance is the only safeguard of consistent high-quality milk.

No test has replaced the senses of taste and smell for a quick and approximate check on milk. It is the test that is paramount to the consumer, and, since he is the final judge, we must not forget that with all of the chemical tests that taste and smell will discover most of the undesirable qualities in milk. When one or two cans of bad milk go through with the good milk all the milk will be damaged. All dealers have had trying experiences with milk that no quick chemical test could detect any decided fault in the milk, yet a bad flavor or odor existed in the milk that played havoc with the dealer's trade. Children are especially quick to detect any off or foreign flavor.

One of the largest dealers in Ohio has five different grades of milk, varying as to quality and fat content. By working with the producers they receive some very high quality milk. Inspectors carefully go over the milk and each shipment put in the proper class. Bonuses are paid for the better milk. The plant manager or superintendent must know how to grade milk in order to train the men on the platform receiving the milk that they can really score the milk proficiently. This means that the inspector must be higher paid than the ordinary receiving man, but this is the cheapest and best form of milk insurance. There are many instances of small dealers who do not co-operate with their producers, and also fail to make a close inspepction of the receippts at their plant. Such plants are small because of such methods and should be and often are forced out of business.

By offering such a good product to the public the dairy industry as a whole, and the market milk man in particular, are performing a wonderful service to humanity. In this, as in any other field of endeavor, the idea of service should be uppermost and remuneration so feverishly sought after by some will come as a natural reward. Volumes have written on the service rendered to man by religious wor but much remains to be said of the invaluable work done humanity by the vendors of the product of the "Foster Mo of the World." It is only by having a product of fine qu that the dairyman can truly say that the cow is the fo mother of the world. Only by establishing and adherin strictly high standards can the ideal be approached. W the standards set must never be lowered, the milkman never cease to strive for a better product, since no one ever be sure that perfection has ever been reached in matter.

As a natural result of close inspection of the milk, sound business methods and plenty of the never-say-die s the dairyman will succeed. The public demands a good p uct, and the distributor who supplies it will make a profit, and at the same time know that he is making a tribution of inestimable value to the health of mankind.

⚜

DO WE USE THE AVAILABLE TOOLS?

Whenever dairy inspectors get together it is q common to hear discussions of inadequate laws, fa legal machinery, lack of sufficient funds and persor and other handicaps of inspection work. This is perf ly proper, for such an exchange of ideas may lea ways and means of improving conditions. But it is fortunate if anyone allows himself to be so discoura by such obstacles that he feels that little can be don secure a better milk supply.

In the same way, we are prone to discuss at le minor points and hair-splitting technicalities. The justment of these fine details is extremely desirabl order that our thought and technique may be stand ized along definite lines. With it all, however, we keep a clear conception of relative proportions and goal for which we are aiming.

Primitive man had crude tools, yet he fashioned himself necessities and conveniences that were a dis advance over previous experience. The modren saw livers a square, true timber; but many buildings st ing today bear, on their beams, the mark of the fashioned broadax.

The foregoing lines should not be considered as a for old-fashioned equipment and methods. Added kn edge is necessary for progress, but advancement is s times slow. The vital thought is that much can b complished if the will drives the instrument. Many have vastly improved their milk supplies through patient, untiring efforts of faithful inspectors, who used wisely the tools at their command.

Do we need a new tool? Very well. Let us tr get it, but in the meantime let us use to advantage to that we possess. The dairy inspector's tool-kit sh contain many implements, some of new device and as old as the saw and the mallet. Patience, courage common sense are not new tools; but their careful accomplishes wonders.

Doubt is an attribute of scientific advance. If w satisfied with known facts, new discoveries would be made so often. Doubt which only tears down e lished principles is futile; that which leads to inte thought is useful. It is a good rule to cling to a u tool and use it with energy until a new and better o evolved.—Bureau of Dairy Industry, U. S. Depart of Agriculture.

GRIDLEY
DAIRY CO.
REFRIGERATED
TRANSPORTATION

Fruehauf Trailers are used by the Gridley Dairy Co., of Milwaukee, to increase the efficiency and substantially cut the costs of Milk transportation.

Fruehauf Trailers

and the low-cost haulage of Milk

"Less labor and more profit" is the keynote of Fruehauf Trailer performance in the haulage of Milk throughout the country. Trailer Tanks, Refrigerator Trailers, Trailers with stake-and-rack bodies—all contributing substantially to greater efficiency and lower costs!

CLOSE COOPERATION

Fruehauf engineers for years have worked shoulder to shoulder with men of long training in the transportation of Milk. Time after time we have built Trailer equipment to meet the precise haulage requirements of certain Milk distributors—and out of this wide experience has come an understanding and appreciation of fundamental factors in low-cost hauling.

If you are not hauling Milk on Trailers at this time, the use of Fruehauf Trailers will result in immediate and tremendous savings over your present haulage costs! May we prove this statement — without obligating you in any way?

Pioneer Builders of Semi-Trailers, Four-Wheel Trailers and Adjustable Pole Trailers.

A Couple of Suggestions From Colorado

How a Denver Milk Dealer Looks After the Customer Who Changes Address. A Boulder Milk Dealer Dresses His Girl Employees in Lavender

By WILLIS H. PARKER

IT TAKES a mighty early bird to beat a milkman on the job and perhaps that is one of the reasons why C. G. Beardsley, superintendent of sales and distribution of the Windsor Farm Dairy, Denver, Colo., compares good salesmen to the early birds, for the first gets the business and the latter gets the worm—both profitable, according to the point of view. He was referring to the constant watchfulness of the salesmen toward the empty houses. He cautions his men to watch all the empty houses all of the time, and the moment one shows signs of life, to leave a sample of milk and a milk card.

In the large city, there generally is confusion at moving time in the regularity with which certain supplies, such as milk, are transferred from one address to another. With milk, there generally is a lapse of a day or two before the schedules get down to normal and during that time the customer must buy milk elsewhere—the neighborhood store or some dairyman who chances by during the day time. In other words the person handling milk at the psychological moment will get some business then and perhaps all the business henceforth.

Thus, the milk distributor who is watching the empty houses and notes activity some morning in one or more of them, leaves a sample bottle of milk (free of charge) and a card, not only stands a chance of getting the business henceforth, but also supplies a need at a critical moment. Perhaps the tenant notified his previous milk man to leave milk at the new address but there is a hitch somewhere in the machinery and the order doesn't get to the man on the route, which includes the new address, and the customer looks in vain the next morning for the familiar bottle of milk from his regular dairy. If a Windsor salesman leaves a bottle without an order, certainly the customer may have excuse to feel disappointed in his old dairyman and the resentment justifies a change in dairies.

On the other hand, there is a chance that the newcomer on the route is a regular Windsor dairy customer and the driver on the old territory was not notified of the proposed change of address soon enough to permit him to notify the driver on the new territory of an addition to his list of customers. Certainly good will is gained by taking care of the newcomer's milk needs without a break in the schedules.

In this connection the company has a very strong rule relative to reporting new customers, quits and transfers. This instruction is given each salesman:

"If you know of any prospects moving in on someone's route, report them to the salesman direct, or to the office, so that they may receive proper attention. Be sure and make your transfers promptly so that your competitor won't beat you to it. Call and see your quits personally on the same day they quit. Turn in your quit cards and new customer cards promptly, so that they may be called on by the representative from the office."

It costs money to obtain new customers and since there are hundreds of families in every city of any size, changing addresses every month, a dairy company cannot afford to permit a competitor to slip in at the time the moves are made, and get the business, because recognizes the need of the product at that particu time—a time when the regular dairyman has failed keep the faith and deliver the goods at the new locati

Lavender Smocks and Cottage Cheese.

Lots of folks make successes because they do thi according to the most approved methods. The Wat- Hardy Dairy Company of Boulder, Colo., are succeedi apparently because they are following the idea of doi things a little bit differently than others. This is pecially true in connection with the uniforms worn the girls who work in the offices and behind the counte waiting on the customers.

Where the generally accepted idea is to garb girls in pure white and starched uniforms, the Wat- Hardy Company prescribes lavender smocks, which th furnish the girls in the same manner that other dair furnish their girls with white dresses.

A rather unusual idea and yet how effective!

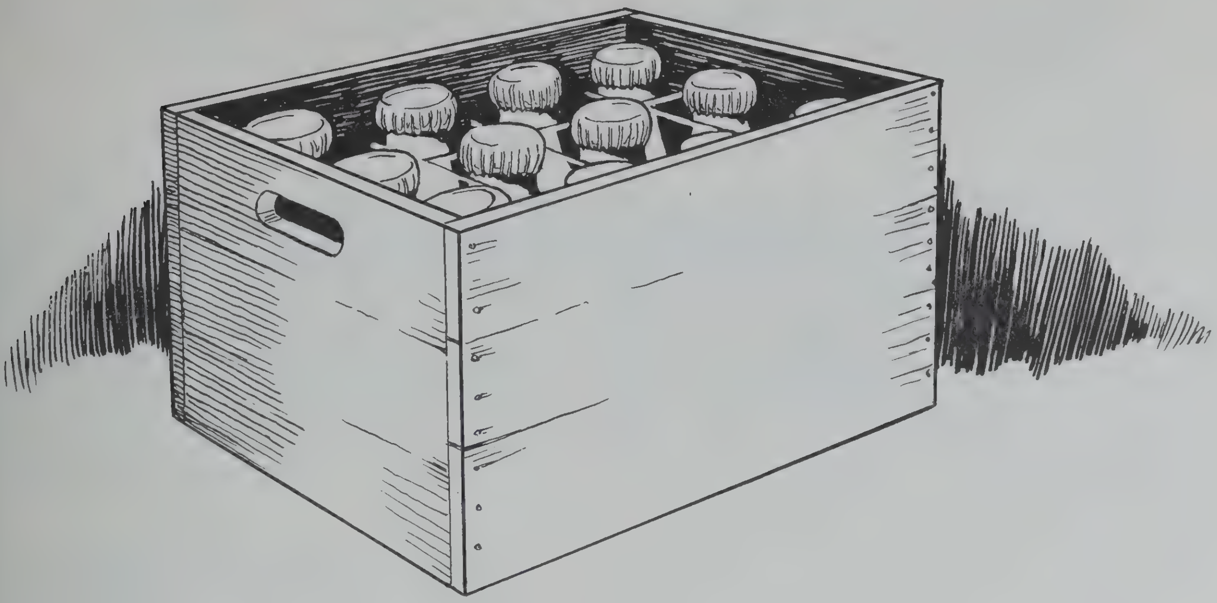
Attractive looking girls to wait on the trade are sets rather than liabilities and the color of a woma dress has much to do with how well she looks. So women cannot wear white, some cannot wear black, green, but it is widely known in style circles that th is one shade of lavender—orchid—that any woman c wear. The blonde or the brunette look equally well, not better, in orchid than in many other colors. The haired girl looks prettier, the black haired girl lo just as good and so does the maiden with perox tresses or golden locks. Lavender and yellow are r tones, and, on the left side and near the shoulder, embroidered in yellow silk, the company's monogram—W.H.—just enough fanciness to take away the sever of the smock lines.

So much for the appearances of the girls themsel—actually some of them look better in this costume th they do in the gowns they wear to and from their w but which are concealed under the smock. Now for general color scheme in the sales rooms as effected the lavender attired girls and the woodwork and m-chandise.

The woodwork is white, an appropriate color fo dairy sales room. The merchandise—milk in bott cottage cheese—is white. It takes very little imagi-tion to understand how well lavender and white h-monize. Then the butter—yellow—yellow and laven are royal colors.

The average well decorated dairy shop is a cold lo-ing place for everything is white. The idea is to p-mote the feeling of cleanliness. We wonder, sometim if it isn't possible for our dairy concerns to put a to of warmness in their decorations and still not detr from the general cleanly appearance of the sho Watts-Hardy is doing this very thing by breaking monotony of the pure white with the warmth of co given the place by the lavender attired girls.

Anyway it's different from what most dairy sh have and customers have remarked about it, accord to Fred C. Watts, one of the proprietors.



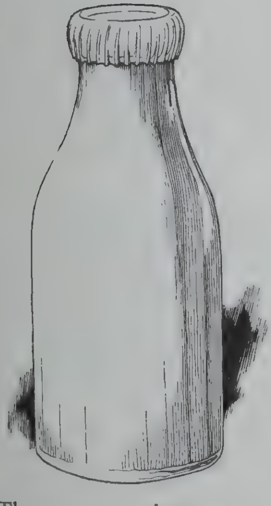
Seal those bottles!

EVERY bottle of milk delivered to the consumer is a potential breeding ground for disease—unless it is really sealed. And only one cover made is an effective and sanitary seal.

The Westlake Sanative Seal, of five-ply spruce paper, is moulded tightly over the lip of the bottle forming an air-tight, water-proof seal which completely protects the customer against contamination from unclean hands, or dirty ice.

It cannot be knocked off or jarred loose in handling, but by a simple turning and lifting movement may be removed and replaced as a dust cover yet cannot be retightened and used as a seal again. This insures the customer against any tampering without instant detection.

Send for complete descriptive bulletin and prices.



There are no wires, or any other equipment of any kind required to keep the Westlake Sanative Seal in place on the bottle. Consequently it is the easiest to apply and the simplest to remove of any cover made.

Paducah Entertains Association

Meetings in Blue Grass State Well Attended to Celebrate Third Anniversary

THE Dairy Products Association of Kentucky cut its "three candle power birthday cake" at the Lake View Country Club, Paducah, November 18, with quail for dinner at the club and duck for supper at the Palmer House. Charles G. Vahlkamp of the association was the unsurpassed host of the day.

The Kentucky association has carried the reputation of having conventions that have meant something in its short career, and the meetings that were held this year, at Paducah, were sufficient evidence to prove that despite the many wonderful things that have been said of the association and the men behind it, there has been no over-rating of them. The meetings which were largely attended were splendid tributes to Mr. Vahlkamp, president of the association, and Carlton Ball, its secretary. To these men, not enough credit can be given for the advancement of dairying in the blue grass state; for they have worked untiringly to put the dairy industries on a firm footing.

Attracts Large Representation.

Not only did the convention attract a large attendance of loyal Kentucky dairy boosters, but a large representation from other states were also present. Indiana, Illinois, Ohio and Tennessee sent large delegations and were very much in evidence during the progress of the convention. Included in the list of guests were: D. P. Adams, Tennessee state dairy commissioner, and H. C. Horneman, chairman of the National Butter Educational and Publicity Campaign.

An invitation was extended by J. O. Barkmen, acting head of the dairy department of the University of Kentucky, to hold the next general meeting in Lexington on January 27, in conjunction with the Annual Farm and Home Convention. The invitation was accepted and inasmuch as the Ohio Dairy Products Association will hold its annual convention in Cincinnati, January 25-26, it was planned to send a good representation from the Kentucky association to Cincinnati to bring the Ohioans on to Lexington for the meeting.

The meetings were especially well attended. The morning was devoted to a general session and a meeting of the board of directors. It was during the morning session that the joint meeting aimed at the existing motor vehicle tax in the state. A motion that was unanimously carried instructed Carlton Ball, general secretary of the association, to advise the governor of Kentucky that the association was opposed to the existing Kentucky Motor Truck Law, as it applies to the taxing of commercial trucks engaged in the transportation of inter-state freight.

Sectional Meetings.

The afternoon was given over to the meetings of the various sections of the association. On the whole, the milk dealers had an excellent meeting. They discussed several subjects of concern to their welfare in a general way, although no specific plans were adopted.

Ice cream manufacturers discussed, at length, the new codification of state rules and regulations pertaining principally to the retailers of ice cream.

Creamerymen in session rejuvenated the idea of uniform cream grading and a committee was appointed to devise such plans for consideration at the next meeting. Recommendations were also made in regard to the super-
vision of cream station advertising. The cream c
ments committee was continued indefinitely and arran
ments made whereby the creameries of Tennessee
secure this literature through the Kentucky associat

Before closing, the assembled convention went
record as giving their appreciation to Mr. Vahlkamp
the excellent and untiring work that he has done
promoting the interests of the Dairy Products Asso
tion of Kentucky. A further mark of appreciation
tendered to Mr. Vahlkamp in the form of a Gladst
bag, bearing the good wishes of the association.

Resisting the Tide

The average business lasts less than ten years. During a period of ten years, any business will have become either a success or a failure.

The **Case Plan** has not only weathered the storm of competition, but also the more formidable opposition of skepticism, and is now entering its twelfth year.

During this time such companies as the following have not only adopted the **Case Plan** as standard equipment, but nearly all are as enthusiastic now, after years of experience, as when first the Plan was installed:

Abbott Alderney Dairies, Philadelphia, Pa.
Belle Isle Creamery, Detroit, Mich.
D. H. Ewing's Sons, Louisville, Ky.
Pevely Dairy, St. Louis, Mo.
Risdon Creamery, Detroit, Mich.
Scott-Powell Dairies, Philadelphia, Pa.
St. Louis Dairy Co., St. Louis, Mo.
Trapp Bros. Dairy, Milwaukee, Wis.
Western Maryland Dairy, Baltimore, Md.
Whiting Milk Companies, Boston, Mass.

While the above list represents only ten of over fifty successful contracts, yet the prominence of these organizations, and the fact that the **Case Plan** is their vehicle for sales development, should cause one to pause before treating this Plan lightly.

Mr. Milkdealer, how can you resist the battery of such organizations as are listed above? Do you consider your judgment better than theirs?

Can You Resist this Tide of Opinion?

SCOPE OF WORK OF REFRIGERATING ASSOCIATION.

By F. B. Fulmer.

The seventh annual convention of the National A ciation of Practical Refrigerating Engineers held Kansas City, Mo., was a successful meeting from ev point of view.

As the name implies, the membership of the organ tion is composed largely of the actual operating gineers. The organization had its inception from a operating engineers of ice plants in the southwest, m ing together to relate experiences, discuss methods improvement and to co-operate with each other in creasing the efficiency of their respective plants. La as the organization began to grow and branch out membership began to increase from engineers of stor plants and the dairy industry.

Refrigeration classed as an industry is making rapid strides and its scope of application is ever seek new fields, so that at present refrigeration is used some form in 227 lines of commercial business.

The organization is purely an educational one, for the past few years has been supplying its mem with printed lectures in bulletin form for study. course of lectures has proved to be very instructive, it is reported that the subject matter contained in lectures has received very favorable consideration fr public institutions where mechanical refrigeration being taught.

There is a large exhibit of refrigeration applia at each convention and the proceeds derived from sale of exhibit space is converted into the educati fund which in turn supports the cost of printing lectures and monthly bulletins sent to the members is reported that approximately $7,000 was derived fr exhibit space at the convention recently held in Ka City. It is understood that the officials in charge planning for a large educational program for 1927.

Where there are several refrigerating engineer one city or locality, they form a local branch of the tional organization and are known as a "chapt Where an engineer is operating in an isolated plan can become a "member-at-large"—paying the same and receiving the same printed matter as the cha member. The general office of the organization i located at 5707 W. Lake St., Chicago.

As refrigeration is one of the foundation stone the dairy industry it is quite apparent that the engine of creameries, ice cream and milk plants should b interested in this fast growing organization as man their problems will, undoubtedly, be dealt with in forthcoming literature. Many of the engineers known to the dairy industry are now members and of the past national presidents is the chief engine a large creamery concern.

The papers presented at the last convention largely dealt with the questions involved in the efficient operation of refrigeration plants. The national convention will be held in San Francisco time in the fall of 1927—this being the first time national meeting has gone to the Pacific Coast.

MILK PRICES IN GREAT BRITAIN.

According to a report by Consul Maurice L. Staf made public by the Department of Commerce, the manent Joint Milk Committee of Producers and Dis utors of Great Britain has set milk prices for the pe October to March, at 16½ pence (33 cents) per g (the British imperial gallon is approximately 20 per larger than the American gallon), and for April to tember, inclusive, at 12 pence (24 cents) per gallon.

VERSITY OF ILLINOIS DAIRY MANUFACTURERS' SHORT COURSE.

he annual short course in the manufacture of dairy lucts will be offered by the department of dairy husdry of the University of Illinois beginning January 927, and continuing through January 29, 1927.

he first week of the course will be devoted to butaking, the second week to the handling of milk for milk supply and the last two weeks to the manuire of ice cream and condensed milk.

he subjects, which will be treated in lecture and ratory work, are as follows:

Buttermaking.

uying and grading cream; testing of cream, butter- and butter; preparation of cream for churning; ning; preparation of butter for market; marketing utter; scoring butter; and handling of eggs by neries.

City Milk Supply.

ethods of buying and grading milk; the milk plant atory; processing milk and the effect of plant esses upon quality of milk; standardization of milk cream; whipping of cream and cream plug forma- manufacture of soft cheese; manufacture of fered milk drinks; handling of surplus milk; study of labor costs; cleaning milk plant equipment; and riological control in the milk plant.

Manufacture of Ice Cream and Condensed Milk.

rinciples of condensing; manufacture of sweetened unsweetened condensed milk; milk products used in manufacture of ice cream; preparation of the ice n mix; standardization of ice cream; processing the and freezing ice cream; ice cream defects; the comion of ice cream; the use of stabilizers, fillers and overs; manufacture of fancy ice creams, frappes, ets, and ices; and testing and judging ice cream.

e instruction work will be given in the new Dairy factures Building, which is equipped with new and rn machinery of different types, so that in addition ture and laboratory work in the manufacture of arious dairy products the student will have the opnity to study and become familiar with the operaf several makes and styles of dairy equipment.

is course is planned primarily for those who have ome practical experience in the manufacture of products and, although practical experience is not ed for admission, men who have had this experivill receive the greatest benefit.

e only expense is for board and room while in atnce, as no fees are charged for the course.

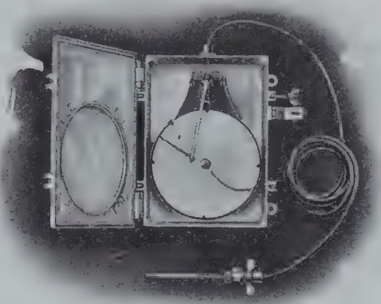
* * *

ISSISSIPPI ICE CREAM SHORT COURSE.

e dairy department at A. & M. College, Miss., will a short course for buttermakers and ice cream s January 24 to 29, 1927. This course is open to xperienced operator.

e program will include lectures and practical work am grading, testing, neutralization, pasteurization, making, control of composition, refrigeration andardzation of the ice cream mix. Special work standardizaton of the ice cream mx will be given nen interested in this particular phase of the work.

arge number of applications have already been re-. Those desiring to enroll should write to the department for application blanks. A five-dollar tory fee will be charged. Meals and room can be d at low cost.



Standardization
— of —
Dairy Equipment

The enviable high degree of efficiency attained by many plants is due largely to the standardization of dairy equipment.

Approved sensitive bulbs and standard sanitary vat fittings for all makes of pasteurizers are included among the many features that recommend

BRISTOL'S
Recording
(Dairy) Thermometers

Other characteristic features of Bristol's Recording Thermometers are the trouble free working mechanism of simple construction, and the direct attachment of penarm to pressure element, insuring an accurate record at all times.

High State of Efficiency in Bowman Plan

New Mayfair Plant of the Bowman Dairy Company, Chicago, Illinois, is the Latest of Several Fine
New Bottling Plants to be Erected in that City. Nothing Left Undone
to Gain Highest Possible Efficiency. Bottling Machines
Run 12 Hours Out of 24.

FIFTY-TWO years ago the founders of the Bowman Dairy Company entered the milk business, and built in that time the large modern milk business that it conducts today. The latest effort of this large organization is evidenced in a new, large, efficient and ultra-sanitary pasteurizing and bottling plant, known as the Mayfair plant. A plant so efficient, so well arranged, having so many interesting, valuable features, that milk dealers in all parts of the country will wish to know about it in detail.

First, to gain an idea of the efficiency of the Mayfair plant of the Bowman Dairy Company, Chicago, it is recorded that the plant is now handling, in its second month of operation, 250,000 pounds of fluid milk in addition to a proportionate quantity of the other products: regular cream and whipping cream; sour cream; buttermilk, and cocoa milk. And this volume of milk is handled by 102 employees. In the words of a prominent advertiser: "There's a reason." And the construction and plan of this plant are the biggest single answer, though, too, loyalty of the employees must be considered, for without their co-operation it could not be done.

The Mayfair Plant.

The plant operates twelve hours every day, that is, the eight bottling machines are filling empties for twelve hours, and, of course, the three washing machines are operating, as well as the pasteurizing equipment, etc. The employees work eight-hour days, except Sundays, when the hours are reduced to six, and are allowed one day off in seven and are given two weeks vacation each year.

Contributing to the efficiency of this newest of the Bowman Dairy Company plants, is the fact that practically all of the equipment used to handle the fluid milk for bottling is laid out on the ground floor. The plant faces toward the west and there is an alleyway on the south. Here it is that the wagons, returning from their daily routes, unload into a series of doors which lead into a room running the entire length of the building. The return cases, with their empty bottles, are taken off the wagons and trucks, put onto conveyors at the windows and roll to the bottle washing machines. Men remove the bottles from the cases, place them into the washing machines and the cases continue their journey, passing through case washing machines, until they meet the bottles again at the filling and capping machines.

We have said the building faces the west and that these unloading windows are on the south. They travel, from the time they are unloaded, directly northw through the bottle washing machines, to the fillers cappers, thence by conveying machinery into the frigerated room running parallel with the receiving r on the south, which is at the north and which is se also by an alleyway and with doors through which wagons are loaded.

Thus, the majority of the bottles and cases sin pass from the south side of the building to the nc where they are stacked and iced and stored until loa onto the route wagons and trucks in the morning, re to be sure, for delivery to the consumer's doorstep.

As for the course of the milk, another item in efficiency of this plant, it is received on the north of the building, practically all of the 250,000 pou coming in refrigerated cars, of which, it is in esting to know, the man Dairy Company o ates a fleet of forty. spur on which these are spotted is elevated so the milk is already a elevation above the gro floor level before unloa

By filtered air pres the milk is condu through sanitary pipe four glass-lined conta tanks, which are situate a balcony above the tling and pasteur room. It flows from container tanks to the distance flow pasteure where it is automati heated, held and coole the exact temperatur quired and then flows t intermediate contai tanks which takes ca the fluctuating reci ments of the bottle fi machines. The milk remains in it for a time and just immed before being bottled. A recording gauge is attach that the amount of milk in this tank may at all tim ascertained as the length of time it remains befor bo tling has some effect upon the cream line, which us of course, at all times be uniform.

There are no further steps to the flow of milk, has been unloaded from the tank cars, been pasteurize and bottled, where it joins the parade of the bottle an cases, from south to north, and finds the ultimat en of all good milk.

Sanitation, which is the omnipresent thought milk dealers, is carefully looked after in the Mayfai plant of the Bowman Dairy Company. The usua pr cautionary measures are observed, or, perhaps it soul be written the unusual, for practically every day this day is following unusual precautions and measure to insure sanitation. There are completely autc

Floor Plan of the Bowman Mayfair Plant.

The Mayfair Plant of the Bowman Dairy Company, Chicago, Ill., is the largest and most modern dairy west of New York City. The three Meyer Dumore Bottle Cleaners shown above are the most recent additions to the battery of *nineteen* Dumores purchased by the various Bowman Plants.

The Bowman Dairy Company knows, as all other Dumore users do, that to consistently maintain a high quality product, all equipment must be o the most efficient design.

The freshness, richness and purity of Bowman's Milk is safely guarded by Dumore - cleane bottles. In upholding the Bowman slogan, "For 51 Years th Standard of Quality," th Dumore is performing a splendid and highly satisfactory service in every way. Let us sen you bulletins regarding th Dumore and Dumore Junio Bottle Cleaners—the facts mea money to you.

MEYER-DUMORE BOTTLE CLEANER

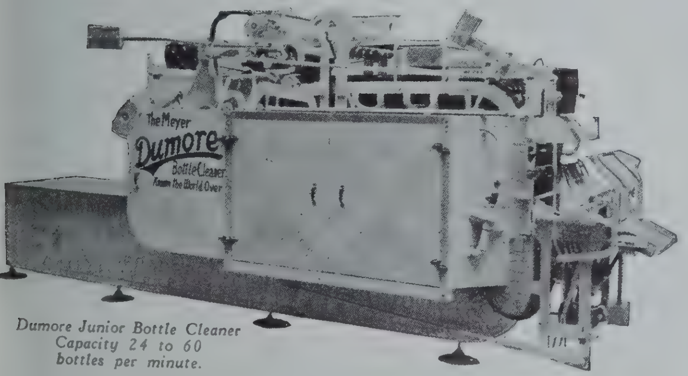
35 Dumores Sold in 25 November Business Days Indicates the Choice of Experts

At the recent Beverage Show held in Buffalo, November 8-12, MEYER DUMORE Bottle Cleaners were again the almost unanimous choice of purchasers buying bottle washers. *17 orders were placed in the five days of the Show!* Our DUMORE sales for the month of November were 35. In October we received orders for 19 machines. During the first nine months of 1926 we received 139 orders, or a total of 193 for the eleven months of 1926.

With December still ahead, this record indicates a 15% greater sales volume than any previous year.

Imitations as usual only emphasize the superiority of the original. The many imitations of MEYER DUMORE Bottle Cleaners in dairies have only increased the popularity of the original.

The Beverage Show was attended almost exclusively by Brewers and Bottlers of Carbonated Beverages. These men are thoroughly familiar with all types of bottle washers. They all start in a small way and have the opportunity to test and judge all makes of machines.



Dumore Junior Bottle Cleaner
Capacity 24 to 60
bottles per minute.

DUMORE-JUNIOR BOTTLE CLEANER

15 machines sold replaced brushless Hydrosoaker type machines.

4 machines replaced Air Brush machines which are being discarded.

2 machines replaced other types of brush washers.

1 machine replaced an imitation machine which has been on the market only a few years.

hy Were These Crates Selected

MILK BOTTLE CRATE CO.

As standard equipment in the splendid new *Mayfair Plant* of the Bowman Dairy Company, the story of which appears in this issue?

The reason is because in the minds of the astute management, our crates—100,000 strong—have conclusively proven their superiority.

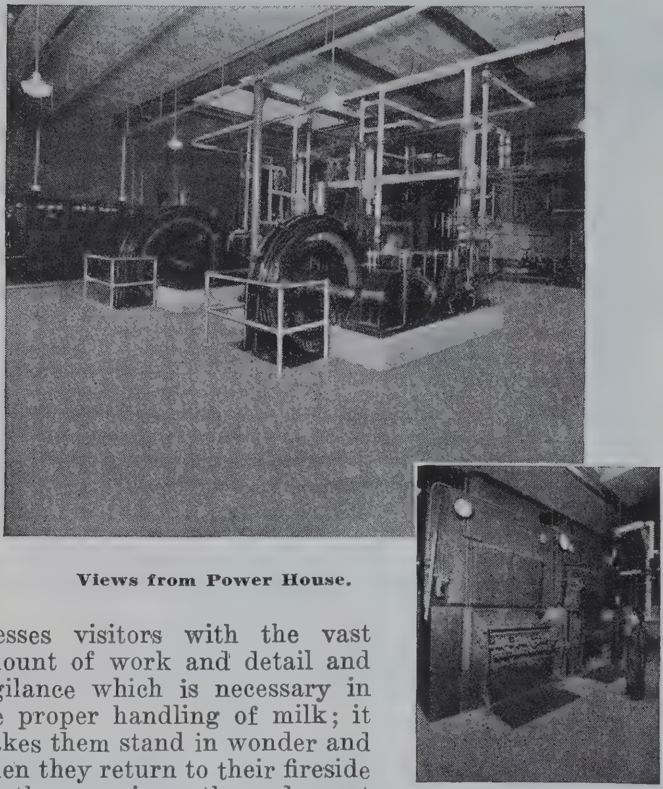
ARE YOU interested in a crate which approaches 100% perfection in both durability and bottle protection? We make it.

An addition to our plant has recently been completed, giving us 25,000 feet of floor space, light and well equipped and practically doubling former manufacturing capacity. We are enabled to offer old customers better service and to take on new business, which, during the past 18 months, we have been forced to decline.

Milk Bottle Crate Company

1543-45 Kingsbury St. · Chicago, Ill.

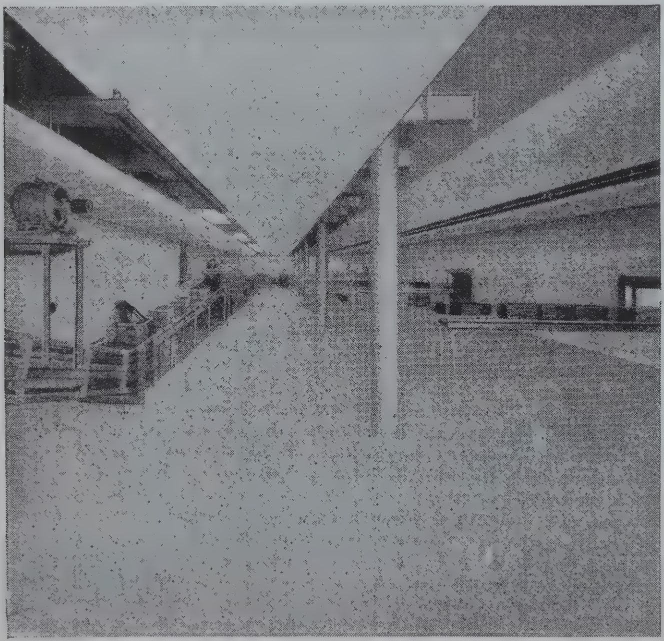
the working of the plant and the various operations without being disturbed or having to strain an ear to hear.



Views from Power House.

This is an advertising feature of much value. It impresses visitors with the vast amount of work and detail and vigilance which is necessary in the proper handling of milk; it makes them stand in wonder and when they return to their fireside in the evening, they do not marvel at the cost of a bottle of milk, or are they very apt to complain about "its high price." Also it "sells" them on the merits of the milk sold by this company, for here they see how everything is clean, how their health, and the health of their babies and children is safeguarded with all possible human caution.

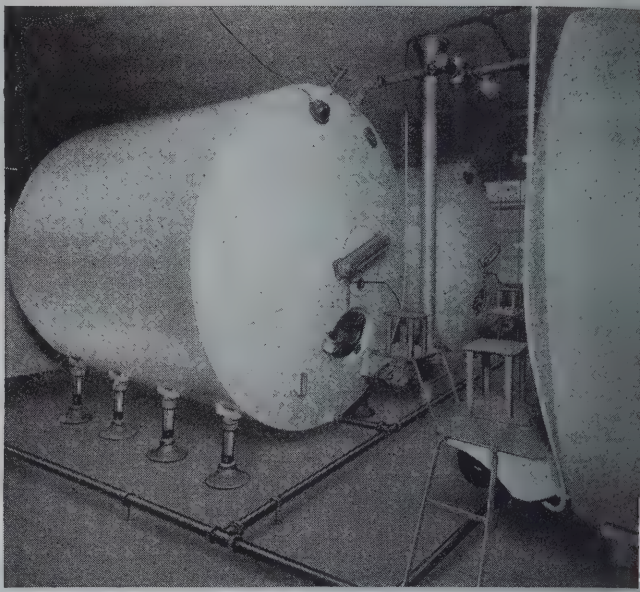
The pipes leading to the pasteurizers, from the boiler and refrigerating units, as well as from the air pumps, are contained in a pipe loft over the ceiling of the large main room. They are, therefore, not visible, but the enclosure is of such size as to permit easy access to them for repair purposes, or cleaning. The usual unsightly maze of piping on the ceiling is thus greatly minimized.



Refrigerated Room for Storing Bottled Milk.

The appearance of the room is thus kept neat and cle

Where does this plant secure its efficiency? H does it differ from most other plants in securing effici operation, at a saving in labor and in time and, sim taneously, in producing the highest possible grade milk? Consider that approximately seventy per cent the bottles and cases are passed directly through t plant from the returning wagons with only one handli and only stored for a comparatively few hours! Th is a big saving here, and a great deal of efficiency.



Glass Lined Containers.

Consider, again, that the plant is in operation twelve hours during the day. The machinery and equ ment is working a longer number of hours than prev in many plants, therefore their idle time is less and have found another saving and another step in efficien of this Mayfair plant of the Bowman Dairy Company

And consider, if you will, that there are no stairs climb, that the work is, in the main, confined to ground level floor!

There, we believe, are the reasons for the efficien of this plant.

We have written nothing about the power unit

Dept. 1■M MADISON, WIS.

the plant. The power plant, and the refrigerating machinery are in a separate building, across the alley wa on the north. They, too, are models of efficiency and a rather unique thing about them is that they are maintained spotlessly clean, as clean as the room which houses the filling and capping machines. There are also a laboratory, a room where the cocoa milk is manufactured and storage rooms for bottles, crates and other items used in the operation and maintenance of a model milk plant.

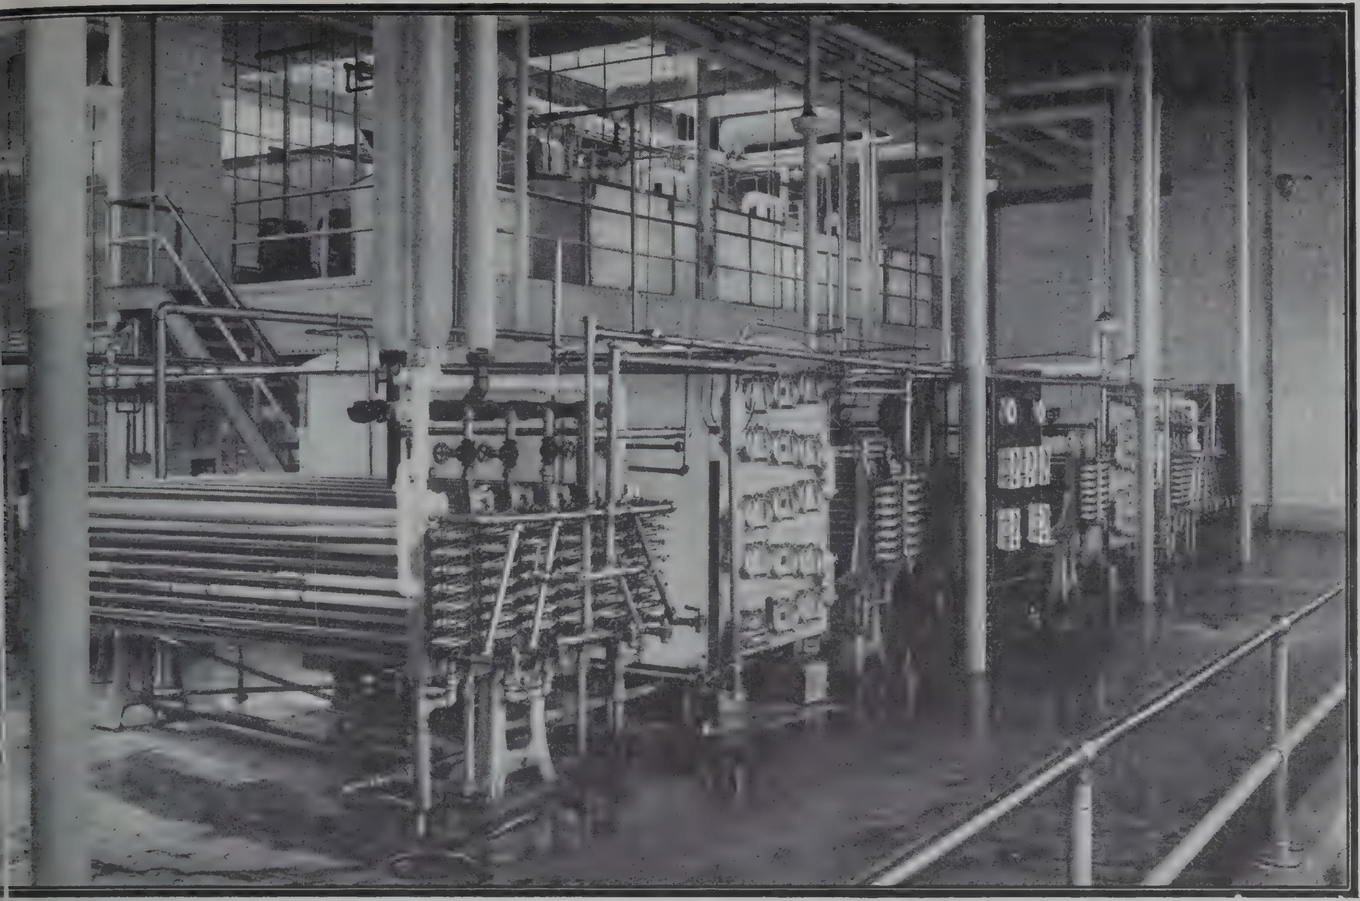
There is an interesting plan behind this plant, which readers will find wort studying in the accompanying drawing. The phot graphs will show how the plant looks and will give tru ideas as to its arrangement. It is so planned that th minimum produces the maximum and, for that reason it will interest and appeal to other milk dealers who ma find in it the idea or plan they have been seeking in co nection with the remodeling of their present plants c in the erection of a new one.

The Mayfair plant of Chicago's largest dairy con pany, the Bowman Dairy Company, is, therefore, pr sented to you at this time. We believe it is worthy your attention. We found it a tribute to the compan and to all those who have been responsible for its plan ning, construction, and methods of handling milk a milk products. Its efficiency is proven by the quantiti of milk handled; but even more so by the fact that t Bowman Dairy Company Mayfair plant is modell similarly to their other city plants, which have been operation sufficiently long to prove their economy and ficiency. When we have written that this type of plant h proved satisfactory to this company, we have said it a

Visitors' Room on Mezzanine Floor.

⁂

You cannot afford to miss a single copy of The M Dealer. Have you sent in your renewal?



—And Now at Mayfair Too!

The Bowman Dairy Company knows milk plant equipment. For several years it has used two 10,000-pound Burrell-Simplex Regenerative Continuous Long Flow Pasteurizing Outfits *complete* at its Chicago State Street plant. They were so satisfactory that the Mayfair plant was equipped with the same type of apparatus.

The Bowman and hundreds of other modern plants use Burrell Pasteurizers because the milk is held *positively* for not less than 30 minutes nor over 35; because there is no loss of temperature during the holding period; because there are no dead ends, pockets or valve mechanisms; because there is no possibility of interleakage of raw and pasteurized milk; because being under pressure from heater to cooler the milk cannot foam in the holder; because the construction of the entire outfit permits sterilizing by steam under pressure; because there is need for only one pump in the entire outfit; because they occupy the smallest floor space per unit capacity; because of simple and inexpensive control devices the outfit can be operated automatically with part of one man's time; because a Burrell-Simplex Internal Tube System heats the milk in less than one minute and cools it in less than three minutes; because the remarkable application of the regenerative principles frequently reduces coal consumption as much as 60 per cent; because *"nothing moves but the milk"*—there is no mechanism and no agitation.

Where the most care is used in the selection of equipment is where most often you find Burrell apparatus. Write us for literature today.

D. H. BURRELL & CO. INC. **LITTLE FALLS, NEW YORK**

TRADE MARK

BURRELL

SIMPLEX

airy Creamery Cheesery and Milk Plant Apparatus

Prof. Burke's Inquiry -:- Department -:-

Correspondence Covering a Variety of Su jects of Interest to Milk Distributors

Dear Sir:—I would like to know if you can tell me how to standardize milk and cream by the point or unit method.

I know how to standardize with skim milk but not with whole milk. Suppose I wanted to make 15 gallons of 35 per cent cream and had to standardize with 3.5 per cent milk and the cream to be standardized tested 50 per cent, how would I figure it out?

I would also like to know where I can buy a good book on standardizing milk and cream.

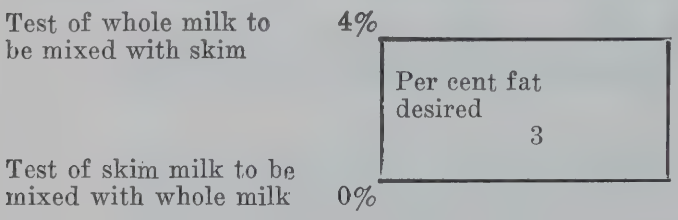
Reply: The method most generally used is that devised by Dr. Pearson, formerly of Cornell University. It is spoken of as the square or rectangle method and eliminates many calculations. For the sake of simplicity I am going to begin with the following problem:

First: How much skim milk and how much 4 per cent milk are necessary to make fifteen gallons of 3 per cent milk?

SOLUTION:

First: Unless otherwise specified, we consider centrifugally separated skim milk as containing no fat, i. e., 0 per cent.

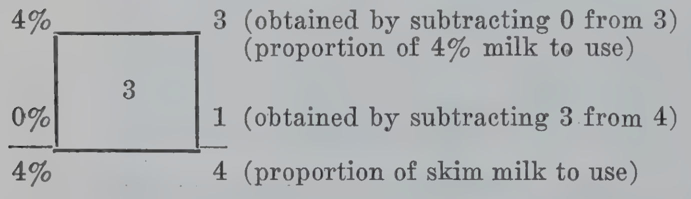
Second: To solve the problem, draw a rectangle and in the center place the percentage of fat desired. In the left hand corners place the percentages of fat in the products on hand, in other words to be mixed. Thus:



Test of whole milk to be mixed with skim
4%
Per cent fat desired
3
Test of skim milk to be mixed with whole milk
0%

Third: Subtract diagonally and thus obtain in either right hand corner a figure representing the proportion of each ingredient to mix with the other.

Thus:



4%
3 (obtained by subtracting 0 from 3)
(proportion of 4% milk to use)
3
0%
1 (obtained by subtracting 3 from 4)
4%
4 (proportion of skim milk to use)

Note: That the smaller is always subtracted from the larger.

As a check to show you have started correctly, note that the difference between the two figures on the left equals 4 the same as the sum of the figures on the right.

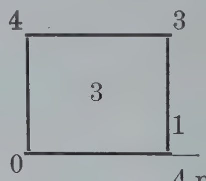
Fourth: The figures on the right of the square indicate the proportion of milk to skim milk that must be used to make three per cent milk. In other words, they must be mixed at the rate of three parts milk to one part of skim milk.

Now if you were to take three gallons of 4% milk and one gallon of skim milk and mix you would obtain four gallons of three per cent milk. However, you desire fifteen gallons. Your fifteen gallons is, therefore, 15÷4 or 3.75 times as great. Therefore, to obtain a total of fifteen gallons we must multiply both three and one by 3.75, thus:

3×3.75=11.25 gallons of 4% milk and 1×3.75=3. gallons skim milk.

11.25+3.75=15 gallons total.

To summarize:



4 parts=15
Then 15÷4×3=11.25
15÷4×1= 3.75

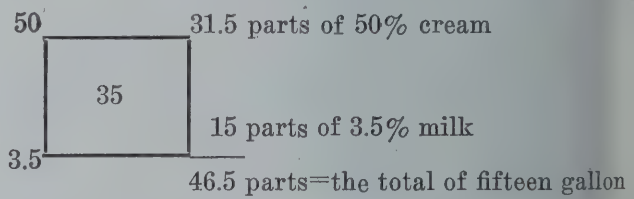
15.00 gallons

Proof: To prove the problem, check the fat in t different amounts of products used. Our total is to fifteen gallons of 3% milk, then 15×.03=4.5 units of f Since skim milk contains no fat all of the 4.5 units mu come from the 4% milk: 11.25×.04=4.5 units showi the problem is correct.

Problem 2: Solving your own problem.

How much 50% cream and 3.5% milk must be mix together to produce fifteen gallons of 35% cream?

Solve this in the same manner as above, thus:



50
31.5 parts of 50% cream
35
15 parts of 3.5% milk
3.5
46.5 parts=the total of fifteen gallon

31.5÷46.5×15=10.1 gallons of 50% cream to use.
15÷46.5×15=4.9 gallons of 3.5% milk to use.
Proof: 15 gal. 35% cream contain 5.25 units of f

Therefore:
10.1 gal.× .50=5.05 units fat
4.9 gal.×.035= .17 units fat

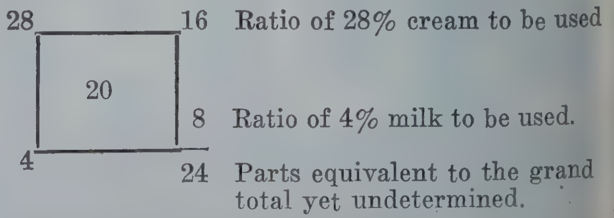
5.22 units fat

The slight error is due to not having carried problem out farther.

I now wish to call your attention to a second ty of problem reading as follows:

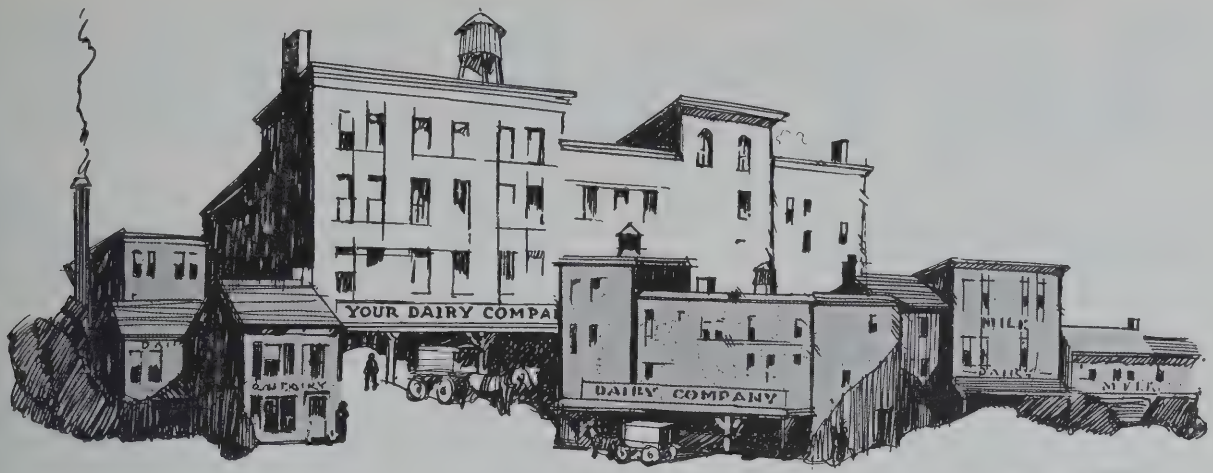
How much 4% milk must be added to fifteen gall of 28% cream to reduce the test to 20%?

Note this problem does not call for a definite num of gallons. Your result will therefore be greater th fifteen. Solve it as follows:



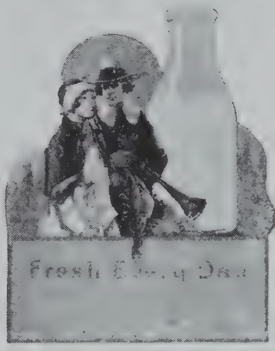
28
16 Ratio of 28% cream to be used
20
8 Ratio of 4% milk to be used.
4
24 Parts equivalent to the grand total yet undetermined.

(Continued on page 78)

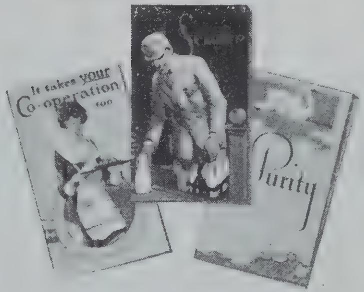


YOUR DAIRY COMPA
DAIRY COMPANY
MILK
DAIRY

iving YOUR BUSINESS a Personality —

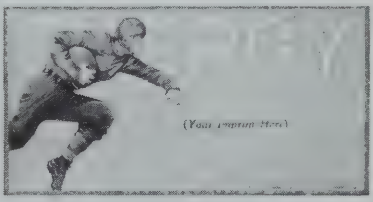


ON the loading platform of your plant it is "*your milk*"—is it still "*your* milk" when it reaches the homes of your customers or is it just "milk"?



It takes your Co-operation too
Purity

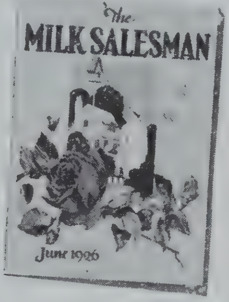
The answer to that question depends entirely on whether you preserve your identity clear through to the homes you serve. And it's a mighty important question because millions of gallons of milk flood the cities of this country every day. And if you're spending money to get good milk and to give good service, you can't afford to submerge the personality of your business in the daily Niagara of milk that pours out over the country.



(Your imprint Here)

That's what advertising is for.

Never mind now about education. The purpose of advertising isn't to educate—it's to sell goods. And you can use it, if you like, to make *your* milk stand head and shoulders above the common level.



The MILK SALESMAN
June 1926

Let us tell you how we are helping other dealers do this job. We've had a lot of experience in the milk business. We know the milk man's message and the milk man's market. Maybe we can help you. Drop us a card.

HE FARRAR ADVERTISING COMPANY

108 FULTON BUILDING :: :: :: PITTSBURGH, PENNA.

Please Mention The Milk Dealer.

In this case the sixteen parts is equivalent to the fifteen gallons.

Therefore: 15÷16×24=22.5 parts or grand total

Since fifteen gallons are cream then 22.5—15=7.5 gallons must be 4% milk.

Proof: 15 gal.×.28 cream contains 4.2 units fat.
7.5 gal.×.04% milk contains .3 units fat.
—
Total 4.5 units fat.
Total gallons made 22.5 gal.
Then 22.5×20=4.5 units fat.

You can solve any similar problem using the same methods. However, I believe you would find it more desirable to work the problems in pounds rather than gallons. I would assume cream to weigh 8.4 pounds per gallon and milk 8.6 pounds. I suggest you obtain a copy of Bul. 98, Cornell Reading Course, entitled "Practical Examples in Dairy Arithmetic."

* * *

Dear Sir:—We would appreciate it if you would help us locate the cause of our "stringy milk."

We gather milk from 15 farms at from 7 to 8 A. M., the night's milk being cooled at farm by setting can in tub or tank of cold water. We pasteurize this milk (both night's and morning's together) to 142-145 degrees, hold 30 minutes, pump up through a filter and aerate to about 52-55 degrees, and bottle it. It takes one-half to one hour to bottle it off. Then it is run in the cooler room, temperature 42 to 45 degrees. About half of our milk is sold the same morning it is received from the farms and half is held over until early next morning. The fresher milk seems to bother us just as much as the day-old milk. The stringy condition shows up after the milk has been partly used up and set away a few hours, then the cream seems stringy. We have tried to find the localities in which the ropy milk is produced, but it seems to show up here or there under most every condition at times and then again nowhere for weeks. We never have found it upon first opening a bottle regardless of age, but always after it has set a few hours, if at all.

Reply: There are numerous possible causes of the difficulty which you are having with stringy milk. This trouble, as you probably know, is caused by a type of bacteria. A few types of these organisms are fairly resistant and may withstand the temperature of pasteurization although experiments have proven that the common organism producing this defect is generally killed at 145 degrees for 10 to 15 minutes.

Another possibility is that the infection has spread in the plant and the bacteria are being transferred to the milk at some point in the process of handling it after pasteurization.

I note that the trouble appears to develop chiefly in the cream. This is natural in that the cream as it rises through the milk would tend to sweep the milk of some of its bacteria so that the organisms would be more concentrated in the cream.

From what you mention in your letter I am inclined to believe the difficulty can be traced directly to one of the farms from which you obtain your milk rather than through any possible plant contamination. I suggest that you set aside in a sterile bottle, about one-half pint of milk from each farm as it is received. In this way you can quickly detect the herd which is causing the trouble. Then I advise that you have the dairyman clean up his premises and disinfect, using lime plentifully. If cows are wading in water, especially shallow pools, or passing through marshy ground on the way to the barn it is possible the bacteria may get on their hides. In this case small scurf particles might fall into the pail during milking and contaminate the product.

Again I suggest you examine the tubs or tanks which the cans are set. I have frequently found th far from sanitary. In such cases it would be very e to contaminate the milk. Even at your plant a can t had set in stale, contaminated tank water might c moisture of condensation into the vat of milk while were emptying it.

As a final precaution I suggest you check the ac racy of the thermometer on your pasteurization vat recently found a case somewhat similar to yours wh the thermometer registered incorrectly, resulting in sufficient pasteurization.

Dear Sir:—I am very much obliged to you for y letter of August 9 explaining to me the Mitche method for testing fat in buttermilk.

Please excuse me, Prof. Burke, if I insist asking again for your advice for my buttermilk business.

People here like the buttermilk as it is when c curdled but not broken. There is the reason why as s as I mix the starter with the skim milk I immedia bottle the buttermilk and leave it to curdle in the bott Sometimes we put the buttermilk in glasses instead bottles and people say that buttermilk is only good w they turn over the glasses and the curdled milk d fall. At the same time whey must not come out beca in case it does people say that milk has been watere

For avoiding the shaking of the buttermilk whe is delivered to our stores in the wagons now as soon the buttermilk has been bottled I send the bottles to stores and let the milk to curdle in the stores, curdling taking place in twelve to fourteen hours can do this at present moment because our store's t perature is about 20 to 22 degrees C. but I am af that it will not be possible to follow in the same when summer comes with higher temperatures.

What do you advise me to do for my butter business now that you are acquainted with our local ditions?

Reply: I believe you can overcome wheying-off dencies by employing gelatine in its manufacture. So time ago an interesting article appeared on the sub of the use of gelatine in buttermilk, in The Milk De This was in the July, 1925 issue in case you should to get the publication. The author suggested the dition of .25 per cent gelatine to the buttermilk. It prepared as follows:

The gelatine was added to the skim milk in powde form and this heated to 170 degrees F. for 20 min (about 76½ degrees C.). This was followed by coo to the setting temperature when 5 per cent of mo starter was added. The author of this article tried half per cent gelatine but found the buttermilk t especially stiff and rather difficult to break up. author likewise found that the acidity in the comme buttermilk where gelatine was used was about one-t per cent less than in the control buttermilk contai no gelatine. I believe you can overcome your troul by using the powdered gelatine as above. I suggest purchase a high grade product for in this event can be used.

Personally, I have never had to add gelatine to raw skim milk in order to obtain a good viscous bu milk. However, I have added the gelatine to the p uct after it was prepared. In fact, I have experime with this phase for sometime and have known for past several years that gelatine (approximately .3 cent to ½ per cent) would materially assist in re venting wheying-off after the product was alr broken up. Since you want your product to appea the bottles unbroken, you, of course, will have to the gelatine before the addition of starter. If you se a high grade gelatine it will not be injured to any ex

SAD, *But True*—

ABOUT five or six years ago, the dairymen began to change over from the old Case Type Bottle Washers to the automatic, with the result of a big saving in labor. These new machines also employed dormant soaking which was a new method of soaking to the dairymen and many salesmen tried to leave the impression that this method of soaking was the cure for all bottle washing problems. The result was that regular soft drink and brewery type bottle washers were offered and sold as milk bottle washers and they have not been a real success because they were not built to combat with the dirts, butter-fats, greases, etc., which are found in milk bottles.

We knew that merely dormant soaking would not do the work successfully, or economically, for you cannot keep on dumping the dirts, butter-fats, etc., from dirty bottles directly into the dormant soaking tanks and expect to have a good clean solution nor a sanitary one; neither can you expect to operate in this manner without a big expense for alkali.

THE CLEVELAND BOTTLE WASHERS were therefore designed primarily for washing milk bottles and employed not only dormant soaking but pressure soaking as well and the two systems are applied in such a manner that the dirts, butter-fats, etc., are flushed out of the bottles before they enter the tanks and the bottles again receive hydraulic soaking and flushing after the dormant soaking so that the bottles are thoroughly soaked, sterilized, and are free from every deposit when they leave the soaking tanks.

The Cleveland Bottle Washer with its patented system of pressure and dormant soaking, hot water brushing, self-cleaning attachment and other special features delivers the cleanest and most sterile bottle at one-half the expense.

by heating to 170 degrees F. for 20 minutes, althoug
would not hold it longer than this. I believe you w
get even better results if you will dissolve the gelati
in a small amount of water heated to not higher th
140 degrees F. and then add it to the bulk skim mi
at about the time it reaches 140 degrees F. in the co
ing process.

Finally, I might state that I do not know your la
regarding the use of a product such as gelatine in t
manufacture of buttermilk or in other dairy produc
in Lima, Peru. It might be well for you to look this
before you employ the use of gelatine.

HOLD ANNUAL RABBIT DINNER.

(By Special Correspondent)

Fried rabbit, cranbery sauce, cider, pumpkin pie, w
all the goodies and trimmings. That's just what ha
pened at the close of the old fashioned hunting mat
between the drivers and salesmen of the Reliable Dai
Co. of South Bend, Ind., on the evening of November

They chose sides and went hunting for the hoppi
bunnies, but several of the salesmen found they cou
catch new milk customers much more easily than th
could catch or find the elusive cottontails in the bush
and fields.

Sixty-three rabbits, however, were brought in a
served at the Chamber of Commerce building, and eve
employee of the Reliable Dairy Co. was present with
members of his family, including the four Palmer bro
ers, George, Walter, Frank and Will, as well as th
father and mother.

This is not a butcher shop.
The result of a day's hunt.

Think of it, just 15 years ago George Palmer,
manager, started washing milk bottles in a dish
and delivered all the milk in one wagon, and now
modern wagons and trucks cover every part of So
Bend and suburbs, both wholesale and retail.

The annual rabbit dinner is the occasion for inspi
tion, education and co-operation, and this year the pr
cipal speaker engaged was T. J. Newbill, director of
National Dairy and Food Bureau of Chicago, who
livered one of his popular lectures on milk and
salesmanship.

The splendid family spirit of co-operation and a
eral good time was had by all in games, dancing
music.

The value of such contacts is in the way that
used and the Reliable Palmer boys know the valu
interesting the other side and neglected side of go
will in their organization by getting the wives and
ilies of the employees interested in the organization.
wives have a great influence, as surveys show, on
annual turnover of help engaged in the retail
business.

Getting Quality into Powdered Milk

By Which Surplus Milk is Turned to Greater Profit!

THE Rogers Way of reducing Surplus Milk to its most concentrated form results in a product highly superior in texture, color, solubility and minimum moisture content.

Experienced buyers readily appreciate the quality milk powder made the Rogers Way. It assures a better market and a better market seldom fails to reflect itself in more profit for the seller.

The Rogers Way

Let us tell you all about the Rogers way of reducing surplus milk to powder—the market for the product and the experience of users.

Safeguarding the Milk Supply of Cities

Requirements for the Pasteurization of Milk and Methods of Enforcement. Checking by Competent Authorities Necessary

By WALTER W. SCOFIELD*

PURE, wholesome milk is the one article of food which is essential for the well-being of every person at some period of life. The supremacy of people who use material quantities of milk in the diet over those who do not include milk needs no elaboration here. Suffice it to say that pure, wholesome milk is the most essential food for the people of this country.

The realization of the importance of milk in the diet has been greatly emphasized during recent years by studies of nutrition and by intensive campaigns of advertising. These efforts have resulted in increasing the consumption of milk to a marked degree.

Epidemics Due to Milk.

All of you realize that milk is a medium well adapted for the life and development of bacteria and that the common conditions under which it is produced result in the serious contamination of a large proportion of our milk supply. The contamination of milk with dangerous bacterial life and also the adulteration of milk with foreign substances is a matter of grave public concern because such dangerous milk cannot be detected in most cases by the consumer. A very brief reference is made to the history of milk-borne epidemics in this country to emphasize the fact that milk is the one food which is not adequately safeguarded and which is causing an unnecessarily large number of cases of illness even at this time. In a study made by the American Child Health Association, it was learned that there were 43 milk-borne epidemics involving 1,373 cases in this country in 1924, and 44 milk-borne epidemics involving 1,913 cases in 1925. The diseases included typhoid fever, scarlet fever, septic sore throat, which are reportable in most states, and certain other diseases. In this study it was forcibly pointed out that the available statistics are most incomplete because of the fact that much illness and many deaths in children result from diarrhea and enteritis and that these diseases of children are frequently caused by impure milk. Tuberculosis is another disease which may be transmitted by milk and on which we have no statistics of value although we do know that a very large percentage of the dairy cows in many sections of this country are affected with bovine tuberculosis. We are forced to the conclusion that, while pure milk is a most valuable food, impure milk takes first place in this country in causing more illness than any other food. I am presenting these facts, which are very well known to you, for the purpose of pointing out the necessity for food officials to place greater efforts, time and thought upon the subject of milk control in order to reduce the number of cases of illness attributed to milk. Most of us devote a great amount of time and energy in correcting minor or technical violations of adulteration or misbranding of foods. Would it not be of greater value to the people if we were able to assure them that the milk supply was safe? Surely the people of this country will never consume as much milk as they should as long as outbreaks of disease continue to be traced to this food.

Pasteurization—An Epidemic Preventive.

What is the answer to this problem? In my opi
there is but one answer, pasteurization. This pro
affords ample protection against the possibility of
transmission of disease by milk. Again referring to
studies of epidemics caused by milk it is striking
practically no outbreaks of the "reportable" dise
have been traced to milk, which had been properly
teurized. In consulting the records of the deaths
children from diarrhea and enteritis over a period
years in our larger cities it is apparent at once tha
very marked decrease has occurred since a large
centage of milk supplies have been pasteurized.

Supervision over the pasteurization of milk pres
a field of endeavor to the food control officials whic
most important. It is obvious that the heating of
at temperatures or the holding of milk for periods
time which fail to destroy the dangerous bacteria or
cooling of milk after pasteurization to a tempera
which results in the incubation and development of
viving organisms or the re-infection of pasteurized
by unclean apparatus or receptacles may be worse
no pasteurization. That such conditions are allowe
exist in some pasteurizing establishments is well kn
to those who have made a study of them.

Proper Equipment Necessary.

What requirements for pasteurization should
adopted in order that a safe product will result? In
eral, the requirements should be drawn in a broad
and adopted as a part of a state code or by the de
ment of the state having authority so that the req
ments will be uniform throughout the state and
apply to all types of equipment. The equipment
only varies widely as to the materials used in its
struction but also in the principles of operation.
more simple makes use of a vat in which milk is he
for the required time. Other types provide for a
tinuous flow of milk after heating through tanks,
partments or pipes or the automatic filling and disc
of milk at regular intervals from compartments by
use of gears and valves. In the general supervisi
such establishments it seems necessary for the inves
tors to make detailed studies of the different mac
in order to ascertain whether or not milk does re
proper treatment in them. The general sanitati
the plants should receive consideration. Floors
may be flushed with water are essential. Piping s
be limited to the type which may be taken down
each operation and thoroughly brushed and cleane
adequate supply of pure water should be pro
Waste liquids from the plant should be disposed

for their

Chocolate Malted Milk Drinks

HERE is a new product which is blended from a special Dutch-processed, double milled cocoa and pure barley malt extract with special flavoring to intensify the full chocolate flavor and absorb the bitterness of cocoa.

DAIRIES bottling chocolate milk should be interested in this new preparation. It means a great saving in your syrup purchases. The cost of one gallon of delicious chocolate malted syrup made from KoKo-Malt, which is sufficient to flavor 10 gallons of milk, is 75 cents.

We will be glad to send a sample of KoKo-Malt sufficient to make one gallon of syrup to those interested in this new hit.

THE DAIGGER CORPORATION

Manufacturers

WASHBURN'S PRODUCTS

413-415 Beethoven Place CHICAGO

pasteurized on a particular day together with a statement of the name of the proprietor and the place of pasteurization should appear on the cap. In practice, milk is commonly pasteurized one day and distributed the following day. Unscrupulous dealers may resort to unfair methods of competition by using caps bearing untruthful statements as to the time of pasteurization. Instances of such misbranding should result in prompt legal action as deception of this character is inexcusable. Regulations demanding the date of delivery or the date of shipment on pasteurized milk only aid the dealer in deceiving the public.

A requirement fixing a definite period of time after pasteurization during which pasteurized milk may be sold seems desirable. A period of 36 hours after pasteurization is ample for the distribution of pasteurized milk. On the other hand, it seems unwise to attempt to fix a definite period of time between production and pasteurization as it becomes necessary to draw milk supplies from greater and greater distances or from points which have inadequate transportation. The initial bacterial condition of the milk as well as the temperatures maintained during transit have as great a bearing upon the quality of the milk up to the time of pasteurization as the factor of time.

A requirement that milk shall not be pasteurized a second time should be rigidly enforced.

A Satisfactory Heating and Holding Temperature.

Aside from sanitation it is most essential that milk be heated to a temperature and held at that temperature a sufficient length of time to destroy the dangerous bacteria and then immediatetly cooled to a temperature at which bacteria will not multiply rapidly. There is a considerable difference of opinion as to the proper temperature but we believe that a minimum of 142 degrees F, maintained for 30 minutes does destroy dangerous organisms effectively without injuring the cream line. The attempts which are being made by certain officials to demand a minimum of 145 degrees F. are being opposed strenuously by large milk interests. A much greater amount of research work is needed to settle this disputed point but the evidence available at present indicates that a minimum of 142 degrees for 30 minutes is effective and, in fact, provides some margin of safety. In order to show the temperature and time of pasteurization a recording thermometer should be required to be used on each operation and these records should be dated and filed for reference. Most authorities have not required recording thermometers upon coolers but the cooling of milk to a temperature of 50 degrees F. or lower should be required. The thorough cleansing of all equipment and receptacles is most important and milk should be bottled at the place of pasteurization by mechanical fillers and cappers so that the chances of contamination of milk after pasteurization will be reduced to a minimum.

Testing Pasteurizing Equipment.

In order order to determine the efficiency of the pasteurizing process it seems highly desirable, if not necessary, to make checks on the operations of the different plants, using some scientific method which will prove exactly what results are being obtained. A commonly used method consists of making bacterial counts of the raw milk and by making bacterial counts at the differenc points during the process. Samples of milk are usually taken as received, immediately after pasteurization, immediately after cooling, from the bottle filler and from a bottle which has been filled and sealed. By comparing the results obtained from these different samples, the general efficiency of the plant may be determined
high count at some point usually limits the caus
trouble to a particular part of the apparatus.

In practice, there is only one objection to such
and that is the fact that it requires considerable
and necessitates transporting a considerable amou
laboratory material to the different plants.

In New Jersey we have been interested in ma
another special test to determine whether or not
teurizing equipment of the type through which
flows continuously, actually holds milk the required
of 30 minutes. In this work we have followed the
od recommended by the Bureau of Dairying, U. S
partment of Agriculture, in which a culture of B. P
giosus is used as the testing agent. In making
tests care should be exercised that the pumps ar
erated at the same rate as during the regular pr
A culture of the organism is introduced in water a
ordinary tap temperature at the inlet of the "hold
section and the time is noted. At regular inte
for a period of 30 to 40 minutes samples are
at the outlet. Check samples are taken of the
before the culture is introduced. The samples
plated and the first plate to show the characteristi
colonies of the Prodigiosus organism gives the ap
mate time of holding. Technical objections have
made against this method that water is used in m
the test rather than milk and also that the temper
is that of tap water rather than of pasteurizatio
practice, however, we have obtained very satisfa
results and also results that are startling. The c
uous flow "holders" which employed two to thre
indrical vats were most faulty as the organism wa
erally recovered in less than nine minutes. We
found only a few pasteurizers of the continuou
type that met with this test. In apparatus of the
type which generally employs valves and timing
leaking valves or faulty timing may be demonstrat

Cleansing of Containers Important.

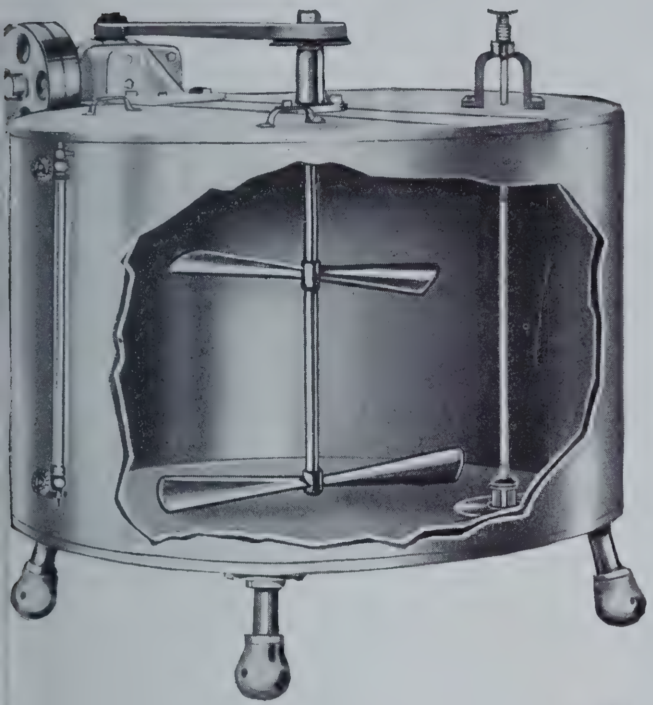
It also seems important to make determinati
the strength of alkali in the solutions used in w
milk bottles by taking samples of the solutions fo
the washers and determining the alkalinity by tit
and also by making bacterial tests of the milk bott
fore and after washing to determine the degree
ciency obtained. During recent years the large
panies have installed large bottle washing ma
which operate automatically. Most of these ma
are built so that the milk bottles pass through di
compartments containing alkaline solutions, fol
which the bottles are rinsed with clean water.
these machines are not designed to use high te
tures in the process of washing the bottles but
in part upon the action of the alkaline solution
tain practical sterilization. It frequently happe
these alkaline solutions are used for long periods
or for the cleansing of enormous numbers of
without renewal or checking the strength of th
tion. Under such circumstances the alkali solutio
become very weak because of the neutralizati
actually become filthy from the dirt carried into t
tions and the results are far from satisfactory.

Policy of Co-operation.

In the enforcement of this work we have fou
a policy of education and instruction yields grea
sults as most of the persons or firms pasteurizi
today realize the importance of safeguarding the
uct and generally welcome constructive critici

Write For The Facts!

On These Labor and Time Saving Machines



CRESCO Pasteurizer

A thorough test in your own plant will prove it does wonderful work.

Your milk will have a fine flavor and show a very good cream line.

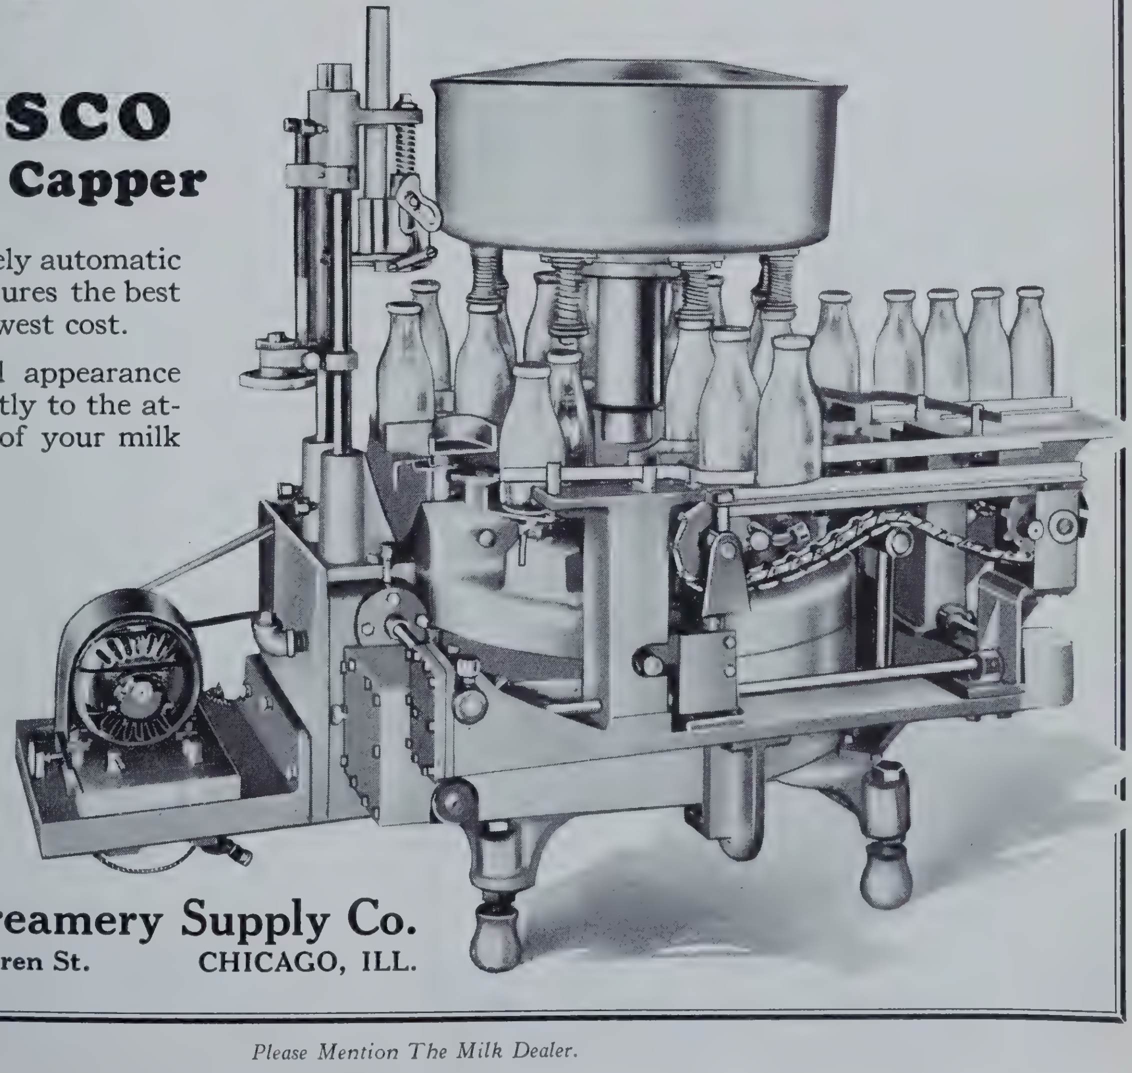
You will be more than pleased and your trade will be more satisfied with your milk.

You will easily gain more trade when your milk is pasteurized in the Cresco Pasteurizer.

CRESCO Filler and Capper

The completely automatic operation assures the best job at the lowest cost.

Its splendid appearance will add greatly to the attractiveness of your milk plant.



Write for the Facts!

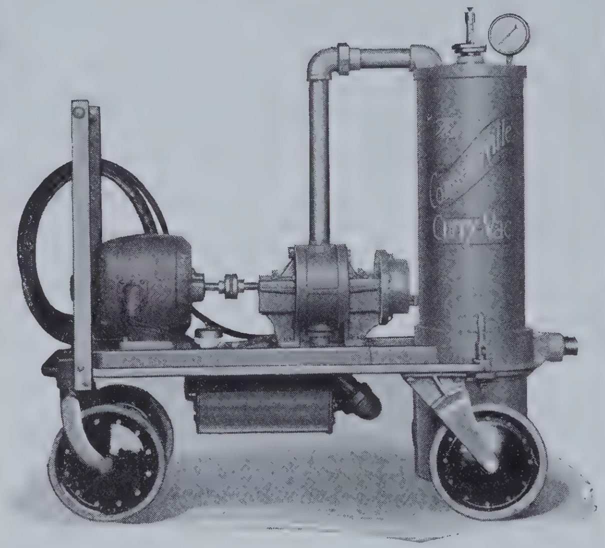
Why Not a Xmas Present?



A "CONNERSVILLE CURRY-VAC"

To the Stablemen—

Put a Curry-Vac in your stable as a present to the men who are working to keep your animals well groomed. They will appreciate it as the work will be easier, more quickly done, and all that dust will be eliminated.

For the Cows—

Cows actually enjoy being cleaned by a Curry-Vac. Not only do they like it but it does them good. They are more healthy, and produce more milk on less feed when kept clean. Curry-Vacs greatly reduce the bacteria in milk.

For the Horses—

Horses that are cleaned by Curry-Vacs will out-work those that are hand cleaned. The pores of the skin are kept open and all dirt and dandruff are removed. Disabled horses are almost unknown with Curry-Vacs.

Send the Coupon for Information on these Machines.

United Vacuum Appliance Corp.

Name ....
Address ....
City ....

New Jersey we statrted the work of checking the tinuous flow type pasteurizers less than three years and had at that time approximately 50 plants u faulty continuous flow equipment. Without any c action we have succeeded in having the equipmen more than one-half of these plants changed and mo the others are contemplating making a change a early date. Of course, we propose to take drastic a against those persons or firms who refuse to confor the requirements after instruction.

In the enforcement of requirements governing teurization, it seems highly desirable for the state to ploy agents who are able to devote their entire tim this special work and to require all pasteurizing p to be licensed by the state authorities. This prin seems contrary to the tendency at this time in n states of delegating work pertaining to local affai local authorities. However, as pasteurizing plants frequently located in small communities where tra men are not employed to supervise such operations as pasteurizing plants frequently supply several munities or even ship in inter-state commerce, it s imperative for the state authorities to supervise work, if satisfactory results are to be obtained. granted that additional inspection by municipal in tors is desirable where competent men are employe

In summing up, I desire to make the follo points:

1. Milk is the most important food.
2. Milk is the cause of more illness and deaths any other food.
3. Proper pasteurization of milk renders this food for human consumption.
4. Pasteurization should be checked by comp authorities to see that it is effective.

⁂

THE REAL BOSS.

By Vernon Varney.

Who are you working for,
Friend of mine,
As you steadily plod each day?
Who is your prodder?
Who is your goad?
Who is your spur, I say?

Is it he who sits
In the office there
With the door with the painted name?
Is it he who hands you
Your weekly check
With a murmur of praise or blame?

Who are you working for,
Friend of mine?
Did you ever stop to consider?
Are you sold to one
Who will help you most,
Or just to the highest bidder?

There's only one man
To work for, friend,
And that one employer is — YOU!
No matter what business
You chance to be in,
It's to YOU, friend, SUCCESS will be due!

Oh, the BOSS of the SHOP
May be somebody else:
It may be HIS WORK that you do,
But the BOSS of YOURSELF
Can be NOBODY ELSE —
The BOSS of YOURELF is YOU!

KEEPING TURNOVER RECORDS.

a bulletin recently issued by the Policyholders' ce Bureau of the Metropolitan Life Insurance Com- n emphasis is place on the importance of keeping rord of why employees quit.

e dairy plant operator is always confronted with abor problem, just as other employers of labor. employers are keeping records of why employees and the following "Hints on Keeping Turnover ds," contained in the bulletin, are interesting:

Be sure that every employee is interviewed before g. Require an O. K. from the interviewer before final ff.

Check up doubtful cases to see if the reason given e empoyee and his immediate superior tally. If not, r information and good judgment will be necessary.

There may be several reasons for leaving. Check the ou think most important and note further details, if ary, to help you recall the case.

It is most important to decide whether an employee harged, laid off, or quits voluntarily. For example, a ho feels that he can't learn the job may quit voluntarily for that reason. He should not be entered on the turnover record as "Discharged — couldn't learn," but as "Quit — couldn't learn."

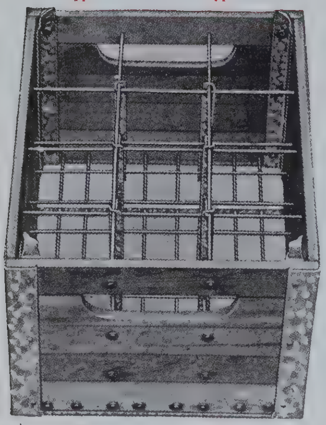
5. Remember, that in many kinds of work an employee who is insubordinate may be fully competent, physically and mentally. Do not confuse discharges for incompetency with those made for disciplinary reasons. The former implies improper selection or placement; the latter may indicate faults in the supervisory force as well as in the employee.

6. Do not conclude that the reason "Leaving for a Better Job" always means competition in the labor market. Some employees, particularly girls, are inclined to give this reason to conceal the real one. Find out, if possible, just what the better job is and how it is better.

7. Consider each exit from the company in the light of previous experience as shown by the analyzed record to date and take any necessary action at once.

"Milk Dealer" Want Ads buy, sell or exchange anything, anywhere. What have you that you would be better off without?

More Trips *and* Longer Wea



More trips—longer life—that's the only way you can make your case investment pay returns.

Broken, weak or wobbly cases mean delays—in the plant or on the route.

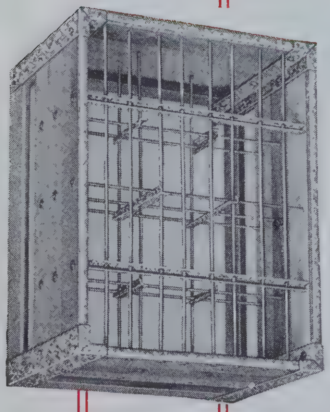
Using damaged cases to get the very last trip out of them is poor economy. Like going out on a long automobile trip with a worn, frazzled tire that is sure to "blow."

Every large milk plant continually needs new cases. Send in your order now for a dozen Armor Klad Cases. A year or two from now, you'll be more pleased than ever with your purchase. Your first dozen of Armor Klads will mean more dozens later on.

Some excellent territory is still available for reputable Jobbers

Armor Klad

Bottle Case



BUILT *for a* BATTLE OF BUMPS

Crash—bang—bump! That's what the average bottle case goes through many times daily. Armor Klad Cases are built to stand this guelling wear. They are completely protected and re-inforced, top, sides and bottom, with heavy galvanized iron. They are made with an extra margin of strength for the hardest use and abuse. And they will give you a twenty-four hour service year in and year out. Fewer parts, securely riveted. Nothing to come loose or apart.

WIDESPREAD FRAUDS.

(From The Milk Messenger, London, England.)

Many months ago we circularized all readers of The k Messenger that there was a man travelling through country soliciting subscriptions for the Olsen publi- ons, "The Milk Dealer," "The Ice Cream Review," the "Butter, Cheese & Egg Journal." We issued a ning against handing over any money to this man for reason that none of this money was being passed to publishers or ourselves. Unfortunately, many people parted with their money before our warning reached n, and others were beguiled, after the warning, to d over the cash for reduced subscriptions. As we, selves, were powerless to act, not having been direct- lefrauded, we could only bring the matter to the ce of Scotland Yard. A certain firm that had paid man money was, however, bold enough to admit r mistake, and good enough to have a warrant issued.

For many months nothing apparently happened. e we were telephoned from the Irish Free State of man's presence there, and once a Birmingham firm phoned us while he was on their premises, but each this elusive fellow slipped away.

During all this time Scotland Yard was inexorably king the man down, and finally Detective Inspector Vesley and Detective Sergeant D. Fish of the Yard him by the heels. Some of the difficulties experi- d in trying to follow him may be guessed, from the that he often changed his outward appearance, times he was clean shaven, sometimes he had a d and moustache, and others only a moustache. her, he was known in various places as Edgar Lane hews, his real name, and in others as Eugene de ville, S. Bell, Wilson Ford, or E. Lane. It was un- his last name that he was soliciting for subscriptions ne Olsen publicatons. He is alleged to have been in Canada, educated in England, and lived at times e United States, so that he could well act as being ish, Colonial or American. He at one time adopted popular horn-rimmed glasses. It was a matter of e difficulty to obtain a photo of him, and there was ys a chance that he might not resemble his photo in way. The Olsen publications were not the only ones aimed to represent. His capture is a warning to the ve not to think that Scotland Yard can be tricked er. He was finally brought before Mr. Wilberforce ndon Sessions, where he pleaded guilty to over 250 es, and was sentenced to 18 months' hard labor.

"Costs 50% less to clean with Oakite"

ACCORDING to the superintendent of a large New York dairy.

Here OAKITE materials are used for washing bottles and cans. Also for general cleaning. And OAKITE does the work *economically*. So economically, in fact, that cleaning now costs only one-half of what it did formerly. Time is saved. Less labor is required. Less cleaning material is needed.

Perhaps you, too, can obtain a similar saving, or some other worthwhile benefit that comes with OAKITE cleaning. Call in one of our service men and find out. Have him show you how thoroughly, quickly, and economically OAKITE removes casein, dried-on milk and dirt from separators, pasteurizers, milk coolers, and other dairy equipment.

Get in touch with us; or write for booklet. No obligation.

Oakite Service Men, cleaning specialists, are located at
Albany, Allentown, Pa., *Atlanta, Ga., Baltimore, *Boston, Bridgeport, *Brooklyn, Buffalo, Camden, Charlotte, N. C., *Chicago, *Cincinnati, *Cleveland, *Columbus, O., *Dallas, *Davenport, *Dayton, *Denver, *Des Moines, *Detroit, Erie, Flint, Mich., Fresno, Cal., *Grand Rapids, Harrisburg, Hartford, *Indianapolis, Jacksonville, Fla., *Kansas City, *Los Angeles, Louisville, Ky., *Milwaukee, *Minneapolis, *Montreal, Newark, Newburgh, N. The Chains in the Dairy Industry

Some of the Big Organizations in the Dairy Industry That Are Revolutionizing Sales and Management

THIS seems to be the day and age of CHAINS—chain grocery stores, chain restaurants, chain hotels, etc. The dairy industry has become impressed with the chain idea and as a result there are several now in existence, prominent among these are the following:

1. National Dairy Products Corporation.
2. Southern Dairies.
3. U. S. Dairy Products Corporation.
4. Western Dairy Products.
5. General Ice Cream Corporation.
6. United Milk Products Corporation.
7. Eastern Dairies, Inc.

1. National Dairy Products Corporation: Of all the chains the National Dairy Products Corporation is the largest, having been formed by a combination of a large number of the leading milk and ice cream plants in the United States. They operate in over 1,600 cities and towns in 13 or more states extending from New York to Nebraska and south to Tennessee. They were incorporated December 8, 1923, under the laws of Delaware, with general offices at 120 Broadway, New York City. A few of the many concerns in the National Dairy Products Corporation include the following:

Rieck-McJunkin Dairy Company, Pittsburgh.
Sheffield Farms Company, New York.
Supplee-Wills-Jones Milk Company, Philadelphia.
Clover Farm Dairy Corporation, Memphis.
Nashville Pure Milk Company, Nashville.
Hydrox Ice Cream Company, Chicago.
Chapell Ice Cream Company, Chicago.
Thompson Ice Cream Company, Chicago.
Carpenter Ice Cream Company, St. Louis.
Breyer Ice Cream Company, Philadelphia.
Franklin Ice Cream Company, Kansas City.
Union Ice Cream Company, Nashville.
Luick Ice Cream Company, Milwaukee.

In addition to these and other milk and ice cream companies there are included the Harding Cream Corp. of Omaha, also the Consolidated Buttermilk Corp. The above are only a few of the many companies involved. Officers of the National Dairy Products Corporation are as follows:

T. J. McInnerney, president.
James G. Lewis, treasurer.
F. J. Bridges, secretary.

2. Southern Dairies: With offices in the Homer Building, Washington, D. C., was incorporated August 5, 1925, under the laws of Delaware. This concern produces ice cream almost exclusively, their output in 1925 being a little under 5,000,000 gallons. They have more than 20 concerns as members of this corporation including the following:

Southern Dairies.
Chapin-Sacks, Inc.
Montgomery Dairy Products Company.
Palm Beach Creamery Company.
Horn Milk Products Company.
Hanover Creamery Company.

The officers of the Southern Dairies, Inc., are:

E. S. Perot, Jr., president.
H. W. Shaw, secretary and treasurer.

3. U. S. Dairy Products Corporation: With of
in the Franklin Bank Bldg., Philadelphia, is somev
older than some of the other chains, having been in
porated in December, 1922, under the laws of M
land. This incorporation includes several dairy
panies in the state of Pennsylvania, especially in
eastern portion including Philadelphia, Scranton, R
ing and others. Included in the list of subsidiary
panies are:

Scott-Powell Dairies.
Kelly-Lester Milk Company.
Glouster Sanitary Milk Company.
Woodlawn Farms Dairy Company.
And others.

Their sales in 1925 amounted to a little over $9,
000. The officers of the U. S. Dairy Products Corp
tion include:

F. W. Bacon, president.
H. Williams, Jr., treasurer.
E. D. Richmond, secretary.

4. Western Dairy Products: Was incorporate
little over a year ago, namely, October 1, 1925. T
were incorporated under the laws of Delaware and
their general offices at 1501 Fourth Avenue South, S
tle, Wash. This corporation operates 15 or more plan
Washington and Oregon and have an annual produc
of approximately 3,000,000 gallons of ice cream.

This corporation includes the following:

Seattle Ice Cream Company.
Velvet Ice Cream Company.
Olympiac Ice Cream Company.
Polar Ice Cream Company.
Hazelwood Ice Cream Company.
Mt. Hood Ice Cream Company.
White Clover Ice Cream Company.
Butter Cup Ice Cream Company.
And others.

The president of the Western Dairy Products
H. Berch; the vice-president and secretary is F
Campbell, and the treasurer is J. Frank Holt.

5. General Ice Cream Corporation: Incorpo
July 16, 1925, in New York, with general office
Schenectady, N. Y. This corporation serves over 5
cities and towns and a population of over 4,500
their sales of ice cream in 1925 being a little over 40
000 gallons.

Included in the General Ice Cream Corporatio a
the following:

Albany Ice Cream Company.
Amsterdam Ice Cream Company.
Elmira Ice Cream Company.
Hoefler Ice Cream Company.
International Ice Cream Company.
Rochester Ice Cream Company.
Syracuse Ice Cream Company.
Wheats Ice Cream Company.
And others.

The officers of the General Ice Cream Corporatio are

V. E. Hovey, president.
L. C. Anderson, secretary.
S. T. Nivling, treasurer.

6. United Milk Products Corporation: United Mil

Products Corporation is possibly the youngest of all large dairy corporations, having been incorporated in March, 1926, under the laws of Delaware. Their offices are at 1252 Broadway, Cleveland, O. This corporation includes the following:

Western Reserve Condensed Milk Company.
Gifford Milk Products Company.
Libby, McNeil and Company.
Wisconsin Butter and Cheese Company.
Troy Milk Products Company.
Merton Dairy Products Company.
National Dairy Company.
American Milk Products Company.
And others.

The officers are H. N. Gifford as president and P. H. Haynes as secretary and treasurer.

Another corporation which possibly should be mentioned along with those of the above is Eastern Dairies, Inc.

7. Eastern Dairies, Inc.: They include the following:

New Haven Dairy Company, Connecticut.
Tait Brothers, Massachusetts.
Coon Ice Cream Company, Vermont.
Dolbey Ice Cream Company, Rhode Island.
And others.

In addition to these there are a good many other chains, possibly smaller but nevertheless important. All of these mark a pronounced trend in the dairy industry at the present time toward combinations.

⁂

THE DAIRY INDUSTRY IN ENGLAND.

C. E. Finley, an employee of the Telling-Belle Vernon Co., Cleveland, Ohio, made a trip through England on a bicycle last summer. He was surprised to find the English milk industry so progressive, and his views are given in the following article, taken from "Telling Tales":

> Americans, when traveling in strange lands, are often surprised to see so much progress in industries in which we consider ourselves the leaders. The milk and ice cream industries are good examples of this.
>
> In England, the United Dairies, Ltd., is the largest dairy corporation, and its plants are by far the most modern. This concern has a capital of £5,000,000, and practically controls the milk supply of London and vicinity, the most densely populated district in the world.
>
> One of the newer plants, that of Curtis Brothers & Dumbrill, located at Streatham, London, puts to shame many of America's so-called modern dairies. The plant is just six month's old, and when built it embodied all the good features of the best plants in this country. Before beginning o tions, the company sent several of its young men to Am to make an extensive survey of the industry. Mr. Wa chief chemist, spent several days in our Cedar Avenue two years ago.
>
> This plant is a model of cleanliness, economy of oper and efficiency of methods. At the time of our visit 1 gallons (English) of milk were bottled daily, and the ing force was amazingly small. The plant's capacity is 2 gallons, and the manager at that time expected to be ru at full capacity within three months.
>
> These are some of the outstanding features of this A large and wonderfully equipped chemical and bacteri cal laboratory in which some interesting and profitable e ments were being conducted; an automatic wagon w and a vacuum for cleaning horses; a drying room fo ployees' clothing; scholarships for the sons and daught employees and farmers who produce the milk used b plant; a fund for training the future executives of the pany by sending them to other plants and to other cou for a study of the industry.
>
> The dairy industry in England is in its infancy. plants of United Dairies were the first to bottle milk in quantities. Even now these plants are almost the only to retail milk in bottles. The English people are sl adopt new habits, and for this reason United Dairies been compelled to use an extensive educational cam Even now, many small dealers do not pasteurize and peddlers fill the bottle received from one customer with for a future customer without washing the bottle. The lish housewife has been accustomed to and demands tw liveries a day. Gradually they are being shown the f expense of such a system.
>
> Milk finally has received the attention of Parliament soon there will be strict enforcement of a law just re passed requiring the pasteurization and bottling of all Certain boroughs of London have advanced so far as quire all milk sold within their boundaries to be from culin tested cows and to be produced on inspected far
>
> If "jolly old England" continues her progress we will be sending over there for new ideas about this dairy bus

GALAXY OF METHODS USED.

(Continued from page 32)

There continues to remain a wide diversity in the basis of payment, although the present-day tendency is toward payment by the hundred weight with a tolerance for butterfat above or below a basic fat standard.

In order to ascertain more accurately the methods used for the purchase and payment of whole milk, a questionnaire was prepared and sent to milk plants in the United States and Canada. Replies were received from forty-eight states and several provinces of the Dominion of Canada.

Many Methods Used.

The following paragraphs give in detail the methods used by many of our largest and most successful market milk distributing plants. When the answers were compiled, repetiton of the same methods was found. However, each method, regardless of the number of companies using it, will be stated but once:

1. The pooling system. For all milk, regardless of fat, a fixed price is paid all patrons per one hundred pounds.

2. Uses a plan called the surplus plan. This plan has been in use since 1918, and a brief outline of its main points are given here. A price is paid per quart, f. o. b. town in which plant is located, with the added stipulation that it will not be required to pay more for milk than its competitors. An amount not to exceed one per cent will be deducted to pay for advertising to increase the sales and consumption of whole milk. At all points where milk is bought on weight and test in addition to the price as finally determined, the company will pay for each additional one-tenth of one per cent butterfat, above three and seven-tenths, an amount per hundred weight equal to one-tenth of the semi-monthly average of a pound of ninety-two score butter, as quoted for the local market by the United States bureau of agricultural economics and will deduct an equal amount per hundred weight for each one-tenth of one per cent butterfat below three and seven-tenths per cent. The company will also add .0075 per hundred weight additional to zone prices for class number one milk delivered in producer's cans. In case of strikes or other causes which shall interfere with the transportation of milk, the company shall not be required to accept milk beyond its needs.

Slight Variations.

3. States that milk is purchased by the contract method. A premium is paid for milk above three and seven-tenths per cent butterfat, figured on United States Department of Agriculture bureau of agricultural economics quotations for ninety-two per cent score butter of local market. The price per quart is eight and one-half cents f. o. b. town in which station is located.

4. Buys milk by a contract with the producer called the pooling system contract. This contract is advantageous to both producer and milk dealer. The producer receives nine and one-half cents per quart for his milk. No further deails are given for this class.

5. Does not purchase milk by contract. The price is not set in advance. The producer has no knowledge of what he is to receive for his product until his check arrives on the fifteenth of the following month.

6. Buys milk by contract which is based on four per cent milk f. o. b. town in which station is located. The present price is seven and one-quarter cents per quart, or $3.37 per hundred weight. A premium is paid for milk of low bacterial count.

7. Does not use the contract system. All purchases of milk are made from the shipper and not from producers direct.

8. Uses a method that is known as the two-p plan. The price paid for the fluid milk is determine a formula which is worked out by the dealers and ducers.

9. Buys milk on the open market from producer a butterfat basis. The base price paid is three and half per cent, with a differential of four cents for tenth of one per cent up or down. They do not buy a contract as it is not necessary, as the same price is for all milk. A high retail value for the milk is m tained and no concern is caused by a surplus. The of payment for milk to the producers is the fifteent each month.

10. Pays $3.00 per hundred weight, plus a prem for three and one-half per cent milk. The company mates its needs for the following month and then not the producer as to the volume of milk the company buy from him at the basic price. By this system the ducer is permitted to keep his surplus milk at hom

Individual Surplus Plan.

11. Buys milk by the individual surplus plan. producer is allowed to set his base as the numbe pounds he expects to produce each month during year. He is allowed to change his base between Jan 1st and 25th of each year. At the present time the ducer receives $2.72 per hundred weight, when mil retailing at eleven cents per quart. When retailin twelve cents per quart $3.04 per hundred weight is for four per cent milk.

12. Uses the contract system and buys directly the producers.

13. Does not use the contract system but buys butterfat basis. Five cents per pound of butterf paid for delivery.

14. Represents a number of plants located in large city. All milk is purchased on a non-contract A majority of the plants purchase the milk on a w and fat basis.

15. Represents several milk plants in a large Two prices are paid, one for shipping stations an other price for the direct shipper. A premium for scoring farms and high grade milk is paid.

16. Uses the surplus plan in the event that their do not consume the average quantity. The quanti then pro-rated to take care of the milk furnished their needs.

17. Is a plan whereby a state dairymen's associ is maintained which sells milk to the dealers. information on this plan was not received.

Paying for Quality.

18. Consists of several plants from one region. do not have contracts with the producers but buy milk where they can get the best supply. The price was $3.24 per hundred weight for four per cent milk $3.84 per hundred weight for five and five-tenth cent milk.

19. Does not buy by contract. They pay a pre for milk of a low bacterial count. One-half of a c paid for milk having a bacterial count of less than per c.c. This count is taken from an average of plate counts per month.

20. Uses the contract system. About eighty pe of their milk is bought by contract from producers the remaining twenty per cent is based on surplu receives net butter quotation from a large city m

DISTRIBUTION DIRECTED BY

JOHN W. LADD CO. **CHERRY-BASSETT CO.**

AND SOLD BY LEADING DAIRY SUPPLY HOUSES EVERYWHERE plus twenty cents per pound butter. The contract price is $4.45 per hundred weight.

21. Uses no contracts, and pay $2.70 for milk testing four per cent.

22. Represents several Canadian stations which state that they use both the contract and non-contract method of buying milk. The prevailing price seems to be about $2.65 per hundred weight for three and one-half per cent milk, with three cents premium above the three and one-half per cent butterfat, or three cents deducted below.

Butterfat Standard.

23. The milk is purchased under the requirement of a written contract. The dealer agrees to purchase milk at $2.50 per hundred weight from September 1 to June 1. The basic butterfat standard is three and one-half per cent, with a tolerande of four cents for each one-tenth of one per cent of fat above or below the standard. From June 1 to September 1 the price paid for milk shall be the open market price, or shall be fifty cents per pound of butterfat of standard test and for all butterfat in the milk above he standard, sour cream prices shall be paid.

24. A price of $3.00 per hundred weight is paid from September 1 to November 1, after which the price is $2.50 per hundred weight, to June 1. From June 1 to September 1, the price shall be as paid by the open market. The butterfat standard during the entire year shall be three and one-half per cent, with a tolerance of five cents for each one-tenth of one per cent, above or below the butterfat standard. The dealer agrees to accept all milk the producer delivers during the entire year. The agreement is verbal. All milk must have a temperature of fifty degrees Fahrenheit or lower at time of delivery.

25. Blank Dairy Company purchases a large volume of market milk. They desire to purchase milk of the best quality and have assurance of receiving a uniform volume during twelve months of the year. A contract is prepared and considered by the parties concerned. The Blank Dairy Company agrees to purchase and pay for, under the terms and conditions hereinafter set forth, all milk delivered during the year of 1925. For all milk delivered the dealer agrees to pay $3.00 per hundred weight for three and one-half per cent milk, with a premium of one-half cent per gallon of milk having a bacterial count of less than 50,000 per cubic centimeter, taken from the average of eight plate counts per month. For every point above three and one-half per cent the dealer agrees to remit three cents additional per one hundred pounds. For every point below three and one-half per cent, a deduction of three cents per one hundred pounds is made. Milk shall not be adulterated or misbranded within the meaning of the Federal Food and Drug Act of June 30, 1906, or acts in amendment of or in addition thereto. The producer hereby licenses the Blank Dairy Company, its servants or agents, to enter upon his premises at reasonable times for the purpose of inspecting his cows, buildings, apparatus and methods in the production of milk. In consequence of present conditions, both in country, market and a sales market, the Blank Dairy Company reserves the right, if necessary, to modify prices and conditions quoted that in any way shall oblige the Blank Creamery Company to pay more for its milk during the month of August than any other dealer operating in Blank City.

Some Limited to Locality.

The systems, as stated, are variable in their application and contents. It is easy to observe that the use of several of the systems is limited to particular localities, others are more elastic and command wider application. A large number of the different sections of the co utilize the contract system to an advantage or di vantage.

Some contracts play an important part in the chase of a large volume of market milk. It woul timely to enumerate several of the advantages and advantages of the contract from the standpoint of dealer and the producer.

Advantages of Buying Milk by Contract.

1. The dealer is certain to receive a definite am of milk which is specifically indicated by the contra

2. The dealer, because of his control of the situa is able to secure a milk of a high and standard qua

3. The dealer has much less trouble with his pat as the agreement aids in smoothing out foreseen understandings.

4. The contract can improve the dealer's busi because it is made more stable and he possesses b control of the situation during a twelve-month peri

5. He has the privilege of farm inspection, whi in itself an asset not to be overlooked.

6. He does not have to receive the milk unle meets the specifications of the contract. This sectio the contract is sometimes used to an injustice to the ducer as some dealer will intentionally find the ducer's milk unsatisfactory when he is experiencin surplus that otherwise would be passed unnoticed.

Disadvantages of Buying Milk by Contract.

1. The dealer is compelled to handle a surplu milk when his customers decrease their consump The margin of profit enjoyed during that part of year when the demand equals the supply is elimin The producer, in this instance, has the upper hand, a much as he has a stable market just so long as he plies with all sections of the contract.

2. Expense involved in making contracts. The ex pense is borne by both parties, however, the major pa absorbed by the dealer.

3. Trouble encountered when producer fails to contract. Every producer who is offered a contract not accept, and oftentimes when a producer has kn edge of the details of the contract he may endeav capitalize on his knowledge to the extent of inv other producers to join him in holding out for a b price, or to formulate a general boycott of the milk ply of the dealer.

4. The contract may hinder his business. Ex ence with a contract teaches that every phase of the agreement cannot be made to so favor one party. party must be willing to be slightly penalized.

Advantages of Buying Milk Without Contract.

1. Need not have any surplus. At a season of the year when the flow of milk greatly exceeds the dem of the consumer, a dealer can, on pre-arrangement ac cept a quantity of milk only sufficient to comply wit the demand. The price of milk may be reduced durin the flush season, or the dealer may object to accepti part or all of the milk of certain producers. Rather sustain this latter loss the producer who is broadmi and not too selfish, will gladly share what othe might prove to be a loss for all parties concerned.

2. Can stop buying from producer more easily his product falls below standard.

3. Saves expense of making contracts.

4. Can regulate price more easily. As condi and markets take an unforeseen turn the dealer ca increase or decrease the supply to meet his own needs.

5. Less trouble with patrons. When the proc

is obligated by a contract he is sometimes prone to take upon himself unnecessary authority or should he desire to free himself of a contract that perhaps would not stand the test in court and has knowledge of this fact, he may make conditions unpleasant for the dealer, particularly if the dealer is experiencing a shortage of milk.

6. Better satisfied. Yes and no. The foregoing statements indicate that the use or failure to use a contract in the purchase of milk may or may not cause the dealer and the producer to be satisfied.

Disadvantages of Buying Milk Without Contract.

1. Milk supply not so stable. The dealer is less likely to have a desirable control of a portion of the local or nearby milk supply. The producer is prone to change from one dealer to another as a better price is offered. This change on the part of the producer may ultimately work to his disadvantage, as the dealers soon learn that he is not reliable as a regular patron.

2. Company must be rather large. Influence must be had by a company to have absolute assurance of receiving a supply of milk necessary to furnish its trade daily. Should an enormous oversupply present itself the company must be positioned to cope with the problem and should be financially capable of absorbing their oversupply or stand the loss. A small company may be financially embarrassed if called upon to face this predicament on more than one occasion.

3. Not certain of milk supply all the year round. The average producer is highly desirous of delivering his milk to a plant where he has some assurance of having a market twelve months of the year and several years in succession.

4. May have desire to raise price to secure amount of milk needed. Should competing companies issue costracts that meet in a satisfactory manner the wants of the average producer, the company not issuing contracts must resort to some procedure to secure sufficient milk to fill its orders. The most common method is to offer a price for milk exceeding that of its competitor. Such a practice costs money. Should its competitors decide to meet the increase in price and perhaps make a further increase in the way of retaliation, the situation can be made most embarrassing for the concern failing to issue the contracts.

Method number one, the pooling of milk, which dates back to 1850, has one and only one advantage, in that it requires very little figuring on the part of the milk dealer and is easily understood since a fixed price is paid for one hundred pounds of milk. The disadvantages of this method are so numerous that they easily outweigh the one advantage mentioned.

Buying on Tradition.

Surprising as it may appear, a large number of milk dealers continue to practice this method. Their reason for doing so in most instances is that the method has been practiced for so long a period of time that should a change be made, the producers would become suspicious. One serious objection to this method is that it encourages dishonesty. When milk is paid for by weight alone there is a temptation for the patron either to increase the weight by adding water, or remove a part of the cream. This is, of course, fraud and imposes a penalty upon the other patrons. Such a system of payment cannot be too strongly condemned.

The price paid for milk, based on consideration of the probable cost of production and the variable supply in relation to the estimated market requirements, is a logical method and is used to some extent.

Buying milk by contract with inserted clauses
are conducive to the production of a high grade prod
with considerate prices seems to be the most unive
method. Flavor, odor, acidity, richness and body sho
determine the quality of the milk. Too high a prem
for dairy farm scores and low bacterial count should
avoided as it is doubtful if this procedure pays.

The method of purchasing milk from the produ
that is the most practical, and one which is without q
tion the most satisfactory to the dealer and produce
the buying of milk by the hundred weight, with a defi
butterfat base, the producer to be reimbursed or
alized as the butterfat test of his product deviates f
the standard. Due recognition should be given to
quality of the milk, the conditions under which it is
duced and its subsequent care until delivered to
plant of the dealer. A contract between the dealer
the producer may or may not be advisable.

Regardless of what the understanding may be
tween the dealer and the producer, the consuming pu
is entitled to the highest quality of product that i
possible to produce. This high quality product n
then be carefully safeguarded by the dealer or dist
utor. An understanding between the producer and
dealer which is entirely satisfactory to all parties g
assurance that the consumer will receive milk of
highest quality.

FAMOUS BUSINESS PROVERBS.

By John T. Bartlett.

> "Only he who attempts the absurd is capable
> of achieving the impossible."—UNAMUNO.

Business history is replete with stories of men
knowing a thing was impractical, set out to do it—
succeeded.

Specialty salesmen have a maxim that the most
likely prospects are the ones they sell to.

Another piece of evidence: "I'm ready to try
thing once," says the modern sophisticate.

Unamuno, in a more literary, comprehensive
expressed a truth in crystal words which in business
been demonstrated again and again. Mass opinio
right in a great many things. A strong social insti
in man is to respect such opinion. It is easy to re
why. Disregard for the overwhelming majority
from the beginning meant at least disapproval.
popularity, and, a great many times, punishment,
always been possibilities.

If mass opinion were always right, the desire
social approval, as the psychologists term it, woul
purely beneficial to the human race. The masses,
ever, are frequently wrong. The masses are pio
Always, must there be leaders, who are courag
enough to assume the risk of leadership.

Courage to be different, to try out the impossi
because it is believed the impossible is genuinely

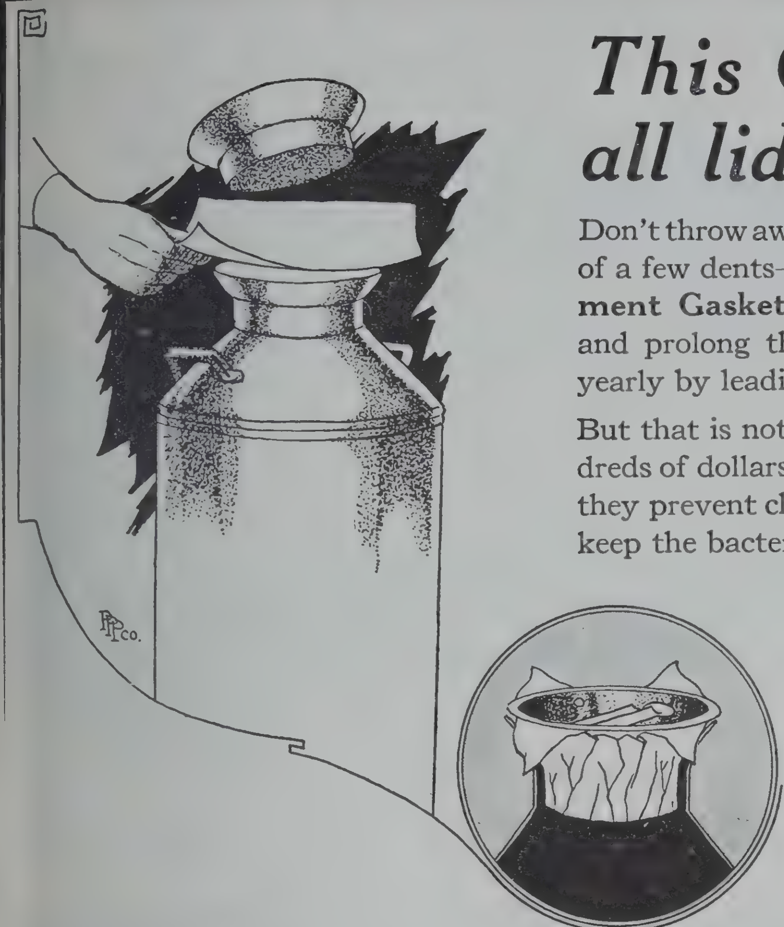
"Milk Dealer" Want Ad.



This Gasket makes all lids fit like new!

Don't throw away perfectly good cans or lids because of a few dents—use **Paterson Vegetable Parchment Gaskets.** They make all lids fit like new and prolong the life of every can. Millions used yearly by leading milk shippers.

But that is not all! Parchment Gaskets save hundreds of dollars worth of "spilled milk and cream"; they prevent churning of cream in the lid and help keep the bacterial count where it belongs.

Parchment Gaskets are easy to use. They come cut to size in packages of 1000. **Soak them thoroughly in clean water,** place over neck of the can and jam down the metal cover.

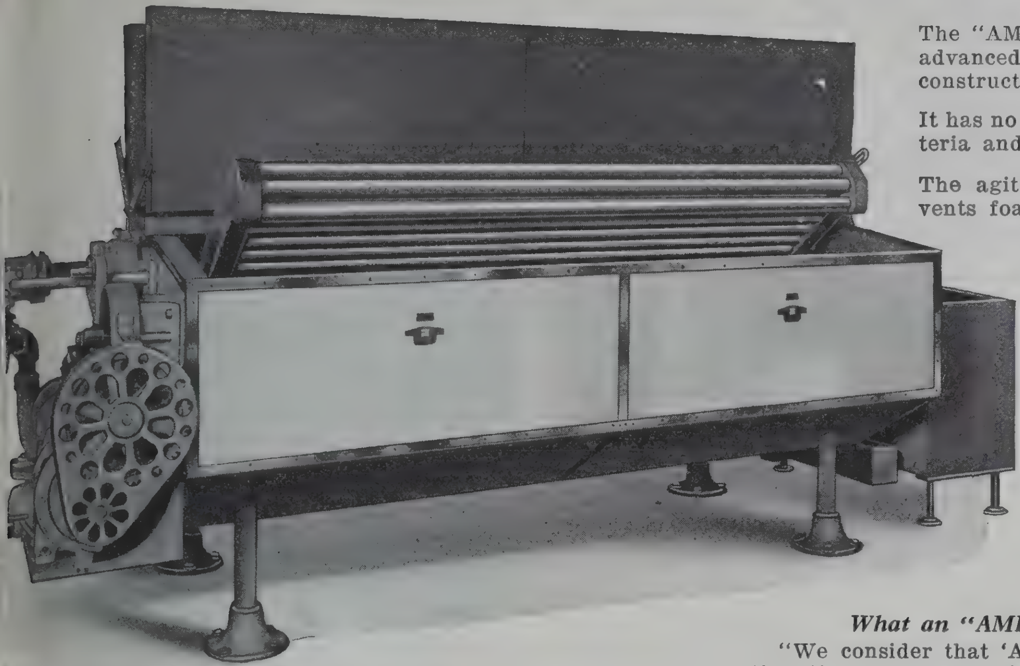
“AMERICO” THE PASTEURIZER WITH A PURPOSE



The “AMERICO” embodies the most advanced principles in design and construction.

It has no stuffing boxes to gather bacteria and contaminate the batch.

The agitation is gentle. This prevents foaming, churning and breaking of fat globules.

Heating is done with water below 160° F. There is no burning on the coils nor scorching of the product.

The flush type outlet valve is standard on all vats.

Thorough cleaning of all parts is accomplished with ease as the coils can be raised out of the vat.

What an “AMERICO” User Says:

“We consider that ‘AMERICO’ is nearer perfection than any pasteurizer we have ever used.”

The new “AMERICO” with improved coil control

* Basic prices for fluid milk.

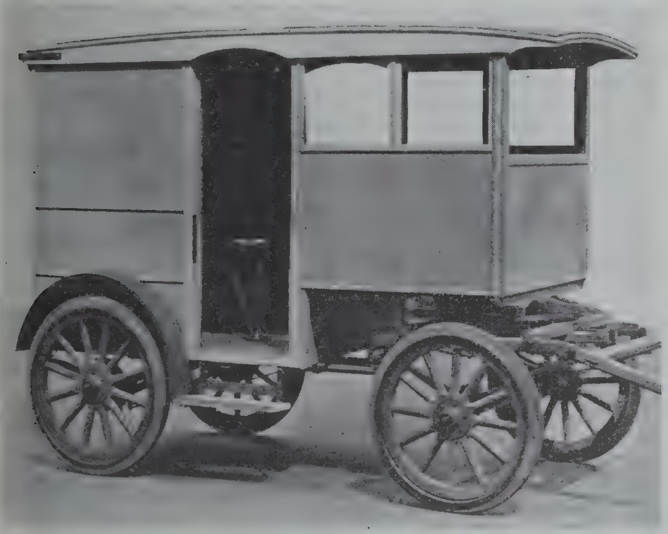
CHRISTMAS is not only the season of "good will," but is also the time when we allow ourselves the privilege of enjoying our friendships to the fullest extent.

Business friendships are the real life of business prosperity, and service is the basis upon which we have enjoyed many friendships in the Milk trade.

We sincerely extend to the Milk industry the heartiest Christmas Greetings and Good Wishes for success in the coming year.

J. B. FORD COMPANY WYANDOTTE, MICHIGAN

A New Step Forward in Milk Wagon Construction!



This new construction eliminates renewal of axles and axle boxes.

One greasing lasts a whole year.

New style rubber tires that out-last three sets made of steel.

Banishes 9/10 of ordinary wheel repairs.

Bodies built of white oak and plymetl panels.

Timken Roller Bearing axles and roller bearing fifth wheel, and special automobile foot brake.

Selected hickory gear and extra heavy springs.

Draft is three times as easy on the horse.

Loads 36 to 42 cases.

Semi low-down construction.

HERE IS THE WAGON THAT WILL CUT REPAIR BILLS AND GIVE YOU LONGER SERVICE.

GET OUR PRICES NOW!

ALBERT RATZENSTEIN PASSES.

Albert Ratzenstein has sold his last bill of goods and has started on his last, long road trip.

For many years identified with the dairy industries, and serving as secretary and treasurer of the Cresco Creamery Supply Co. of Chicago, the death of Mr. Ratzenstein was received by those with whom he was acquainted as a severe shock. It was known that he was in poor health for some time past, but death is never expected. On October 25 it was found necessary to operate on Mr. Ratzenstein and from that time until his death, six days later, the human current supplying life steadily grew fainter.

Although a man of but 47 years of age, the deceased was connected with the dairy industry for the past 35 years, and the host of friends that he has made during that time are countless. Mr. Ratzenstein is survived by two sisters and three brothers.

OHIO COMPANIES MERGE.

The Kenmore Pure Milk Co., Kenmore, O., and Barberton Pure Milk Co., Barberton, O., have been solidated. Tony Rock, proprietor of the former comp for the past seven years, announced the name of the firm will be the Kenmore-Barberton Pure Milk Co.

R. M. Parker, formerly head of the Barberton pany, will remain with the new concern which has of on Wooster-rd., Kenmore.

Rock started the Kenmore business with one which has now expanded to 15. Five routes have added since the merger Monday.

A total of 2,000 gallons of milk and 1,000 gallon dairy products are handled daily.

"The merger will assure our customers of service," Rock said in making the announcement of merger.

No additions will be made to the present plant the exception of installation of some new machiner was announced.

Leffel CREAMERY BOILERS

Save Time Labor Fuel

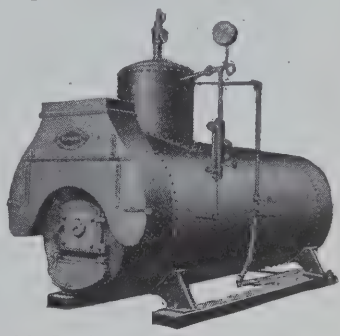
There is no extra or installation expense when you get a Leffel Creamery Boiler. No masonry foundation is required. Heavy wooden skids provide all the foundation needed.

Simply pick out a level spot—slide boiler into place and fire.

Leffel Creamery Boilers are ingeniously constructed to utilize every possible unit of heat from the fuel to give maximum steam production at the lowest possible cost.

In all sizes from 6 to 150 H.P.

They come to you completely equipped with all necessary fittings. A highly efficient, self contained boiler that conforms with all state boiler laws.



Write for more complete details and prices.

The James Leffel & Co. BOX 330 SPRINGFIELD, OHIO, U. S. A.

A MILK FILTER

..very Plant Can Afford

The Chicago Filter

HERE is an inexpensive milk filter that has proved its efficiency in a great many milk plants. It has a very large filtering area and its direct hook-up with the milk line saves floor space. Easy to clean. Nothing to get out of order.

Send for Illustrated Circular.

MILWAUKEE, WISCONSIN

SELECTION AND OPERATION OF BATTERY CHARGING EQUIPMENT.

(Continued from page 30)

ing rate), until the battery begins to gas or bubble, the battery voltage has reached a predetermined va Then the current is reduced to another fixed rate, kn as the finishing rate, at which it is maintained until specific gravity of the electrolyte ceases to rise. A c pletely discharged battery will require about five h at the starting rate, and two hours at the finishing in order to complete the charge. For only partially charged batteries, obviously the charging time is redu

In the constant potential system both the Edison lead types of batteries require charging equipment greater capacities than are required for the constant rent system, as the energy demand at the start of charging period is very high. This fact, in conjunc with the fact that Edison batteries do not give as g a performance when charged by this method, practic limits this system to installations where all batteries ing charged are comprised of the same number of c which makes it possible to impress the same volt across all of them. Even for lead batteries this sys is not so desirable, on account of the excessively h rates taken by the batteries when fully dischar These high rates will cause violent gassing and overh ing of the battery in usual cases, and often cause bu ling of the plates.

The modified constant potential method of charg is similar to the constant potential method, in that batteries are placed on the line and allowed to cha completely without further attention from an opera but it eliminates the undesirable feature of high star rates on the battery. This is accomplished by placin fixed resistance in series with the battery, of such oh value that with a given voltage impressed the charg current at any time during the charge will not be jurious to the battery.

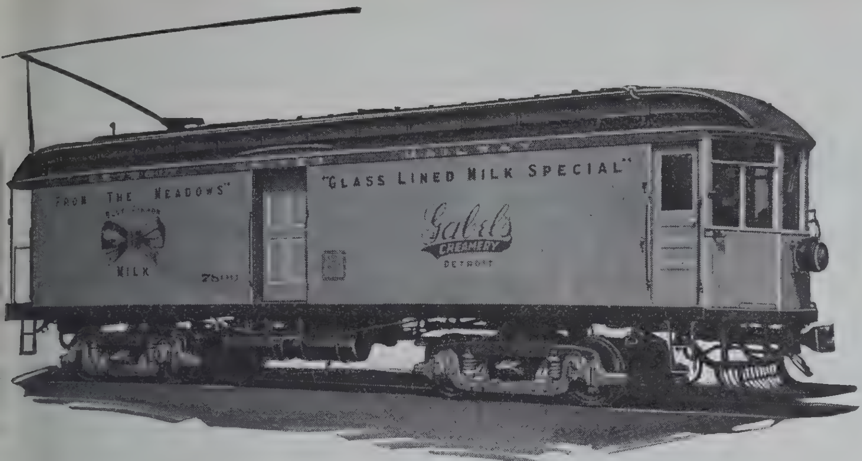
The modified constant potential method is fin great favor among lead battery users, because it le itself readily to the use of automatic charging equipm this feature making it possible to dispense with an tendant after the batteries have been placed on cha

The modified constant potential method is more sirable for charging Edison batteries, than is the stra constant potential method, but still does not possess marked advantages to be gained by the use of the stant current system. If charging voltage differs gre from the battery voltage it will be possible to em this method satisfactorily with the Edison type of tery. The difference in line voltage and battery vol should be such that when the proper resistance i serted in the battery circuit the charging current t battery will not vary over 20 per cent from the sta the finish of the charge. On account of the loss of p in resistance this method of charging will be found i cient compared to the constant current method.

The choice of battery charging equipment is de mined by the conditions as to the source of energy w may be classified as either direct or alternating cur All Edison batteries can be charged at the usual rat potential, varying from 1.5 to 1.85 volts per cell, i lead batteries by potential varying from 2.1 to 2.7 per cell.

If direct current is available, the existing suppl cuit may be used if the voltage is suitable, or the voltage may be reduced to a suitable value by mea a motor-generator set, counter EMF cells (for cha lead batteries), or a balancer set.

Counter EMF cells may be used for charging



(General American Milk Tank Car, interurban type, owned and operated by Gabel Creamery Company, Detroit.)

The illustration below shows the General American Milk Tank Car Equipment for interurban service. Two 2500 gallon, glass lined, seamless, one piece tanks mounted on General American patented cradles. Tanks are insulated and equipped with all accessories.

Now! Interurban Lines to Haul Your Milk

Read What This Progressive Dealer Does.

FROM their country plant, right through the heart of the city and over a switch into their own building. From Flint, Michigan to Detroit, a distance of 73 miles at a cost of 22 cents per 100 pounds. That's how Gabel Creamery Company in Detroit use interurban cars with General American Milk Tank equipment. Rapid, economical, safe transportation. Less handling, no spillage, or spoilage. An efficiency builder and money-maker for Gabel's.

This new General American development opens up new opportunities for dairymen whose plants adjoin interurban lines. No change of milk temperature, no duplication of labor, no loading and unloading overhead...just direct-to-destination, rapid transportation, proved and profitable.

This was made possible through the foresight of the Detroit United Railway and their co-operation with General American engineers.

Write us if you are interested. A letter to our nearest office will bring the detailed facts to you.

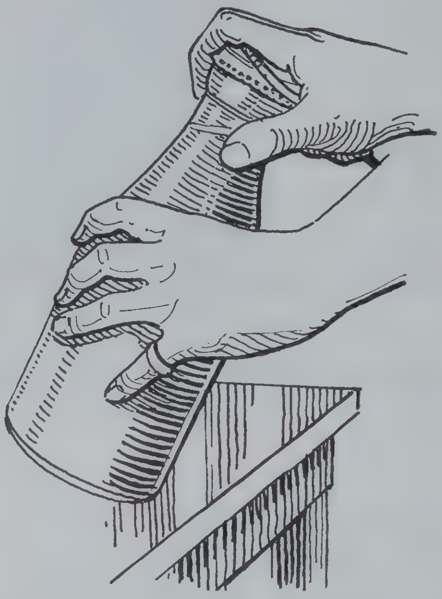
THE
DACRO
METAL CAP

Here at last is the perfect package of Milk or Cream, pure and sweet pasteurized IN the bottle! Made possible by a mechanically perfect closure.



Pure, sweet MILK—delivered under hermetic seal to the home. Handy openers supplied at small cost.

The Dacro Metal Crown—This remarkable cap is made on exactly the same principle as the famous Crown Cork which revolutionized the bottled beverage industry. The Dacro Crown is a hermetic seal. It automatically locks under the glass rim of the bottle. It is scientifically a perfect closure. Sealed with the Dacro Crown, Milk or Cream can be pasteurized in the bottle, an exclusive advantage of this seal. The Dacro Crown covers and protects the pouring lip. It KEEPS clean milk clean! No danger of contamination or tampering with pure contents. And the Dacro Crown can be replaced for temporary covering and seal after opening bottle.

PASTEURIZE YOUR MILK
IN-THE-BOTTLE

THE
Crown Cork & Seal Co.
BALTIMORE, U. S. A.

Inventors and originators of the famous "Crown Cork"

batteries if the required voltage reduction is not m than 12 per cent of the bus voltage, the function of counter EMF cells is to absorb a portion of the line v age, and thereby adjust the voltage impressed on the tery terminals.

If the bus voltage is approximately twice the va required for charging a balancer set may be used to g advantage. A balancer set consists of two direct curr machines, electrically connected in series across the m line bus to provide a 3-wire system, obtained by us the two main circuit wires across which the machines connected, and a third wire brought out from the mid of the machines.

If the voltage supply is not suitable for either counter EMF cell of a balancer set, or, if the only sou of power is alternating current, the M-G set will be m satisfactory for reducing the voltage to the proper va for charging, on account of the wide range of voltage which they may be supplied.

The capacity of motor-generator sets required charging purposes depends upon:

(a) The method of charge to be employed.
(b) The number of cells in each battery, to be char in series.
(c) The number of batteries to be charged simul neously.
(d) The time available for charging.
(e) The amount and duration of boosting desired.

For small installations, rectifiers may be convenien applied for charging industrial batteries. This equ ment is somewhat cheaper than a motor-generator and control, but is limited to installations involving o a few batteries.

Control systems can be arranged to provide for automatic charging or for simply automatic terminat of charge, in addition to the common non-automatic a tures furnished. On all equipment overload and reve current protection should be provided on the equipm more for the protection of the battery than for the cha ing equipment.

By full automatic equipment it is understood that once a battery is placed on the line the charge will pro- gress to completion without further attention. In cas of power failure the batteries will not only be disconne from the charging line and from each other, but u restoration of power, all battery circuits will be cl and placed on the charging line. As each battery rea full charge it is cut off the line and when the last bat has been disconnected the motor generator set wil shut down. The motor generator set will automatic shut down in case of overload and the charge will be continued. This is very desirable, since, if the set is down on account of overload, cause for the over should be investigated before charging is resumed.

Automatic termination of charge is becoming a mon practice where it is found desirable to use a mod constant potential method of charge. This featur automatic termination requires an ampere-hour as well as the contactor or circuit breaker in each tery circuit. The charge may be terminated when required number of ampere hours have been put the battery. This is accomplished by simply setting ampere-hour meter so that when the pre-determ charge has been reached, the meter contact will func to short the holding-in coil of the magnetic contact breaker, causing it to disconnect the battery from charging source.

National Dairy Coupons

The ideal means of handling consumers' accounts.

Convenient and practical for milk distributor and consumer.

Concentrates consumers' requirements to your regular route supply instead of customers splitting requirements at a competitor's retail store supply.

For transient business and apartment deliveries National Dairy Coupons supply the solution to a great problem. They cut down lost accounts and retain the customer so long as he has unused coupons.

Samples, prices and names of users sent on request.

Get an early start in 1927 with National Dairy Coupons and note the beneficial results of their use.

National Checking Co., St. Paul Minn.

CHAMPION MILK JUDGES.

Canadians have been given credit for being good judges of many things heretofore. Now they also have the distinction of being judges of milk par excellence.

The winning team and their spoils.

At the milk judging contest, held in Detroit during the National Dairy Exposition, a team from the University of British Columbia carried away first honors in the milk judging contest. By doing so they won a large cup donated by the J. B. Ford Company, and another which was given by the International Association of Milk Dealers. The team was coached by N. S. Golding, professor at the University of British Columbia.

That the Canadian girls have a sense of taste, as well as "good taste," is well demonstrated by the fact that the winning team had one of the gentler sex on their trio. Reading from left to right in the picture are: Sydney J. Bowman, Prof. N. S. Golding, coach, Miss Helen I. Milne and Jack Berry.

⚜

MAKING THE SCHOOL KIDDIES STRONG.

(Continued from page 26)

"Does it pay? Anyone can readily see that if this saving could be made in one room, it would be a tidy sum if systematically used through all of the schools.

"The satisfaction to be derived by the milk plants, is that they enjoy a nice increase of business, by the increased consumption of milk, and not by the trading of customers at the expense of their competitors.

"Aside from the monetary gain, it ought to be a great feeling of satisfaction to the various milk dealers, to know that they had been a big contributing factor in the making of better boys and girls, physically, and that in turn will make better men and women.

VERMONT OPERATORS AND MANAGERS MEE

The sixth annual short course conference for op
tors and managers of dairy plants offered by the da
department of the University of Vermont was held N
16 to 18, inclusive. More than 100, including sev
from surrounding states, attended this course.

The Vermont Dairy Plant Operators' and Manag
Association held their annual meeting at the same ti
There were many interesting discussions and the m
ing was terminated by a most enjoyable banquet.

Among the many activities of the association
year there will be a special study and effort made
start producers on the right road to equalize product
throughout the year. This is a very live problem
through the East at present.

Senator A. P. Bigelow of Middlesex and E. W. Pa
of Middlebury were re-elected to the board of direc
to succeed themselves. The board later organized
E. W. Parent of Middlebury, president, J. W. Berry
Richmond, vice-president; E. C. Hillis of No. Montpe
treasurer, and Prof. H. B. Ellenberger of Burlingto
secretary.

In the butter exhibit first place was won by
Lamoille Valley Creamery, East Hardwick, Vt., wi
score of 93.5. Second, third and fourth were won
W. H. Ware, Corinth Co-operative Creamery, Cori
H. W. Gillette, Richmond Co-operative Association, R
mond, and O. E. King, Washington Creamery, Wash
ton, respectively.

Awards in the butter judging contest were as
lows: First, B. C. Jennings, East Hardwick; second
N. Paquette, Enosburg Falls, and third, E. C. Hillis,
Montpelier.

In the milk judging contest honors were concentr
at Barre. A. Pierce running first, Dr. E. H. Banc
second, and William J. Chamberlin third.

The Barre representation also came in strong in
ice cream judging contest, William J. Chamberlin
ning first, Dr. E. H. Bancroft, second, and E. C. Hill
No. Montpelier third.

Much interest was taken in the can rolling con
for much milk must be handled in that way in the st
First honors went to L. L. Garrand of Grand Isle, se
to Frank Simpson of Underhill and third to Elmer
of Richmond.

While there is still much butter printed out by
directly from the churn, there were not many willin
enter the butter printing contest as contestants.
place went to L. L. Garrand of Grand Isle, second

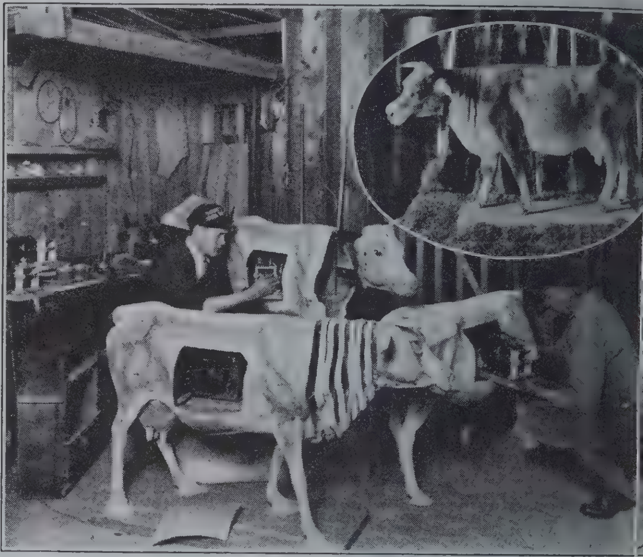
A SYNTHETIC COW AT LAST.

Perhaps the synthetic cow has at last truly c into her own. Perhaps all the talk we have he about her has finally resulted in her actuality, in being in fact a part of the dairy industry. And, haps, also, that part is not so terribly small.

But this synthetic cow we are writing about, which we believe has a part to play in the dairy in try, does not give fluid milk; neither does she cons luxuriant grasses; nor does she produce milk. W she does do, and do mighty well, is to present a pic of vivid likeness to her milk-producing "sistern." wears a coat of hair of the proper colors and shades; switches her tail in the true fly-chasing fashion; moves her jaws as evenly, slowly, contentedly as purple ribboned grand champion at the National Da Show; she rolls her eyes, and moves her eye br But she is synthetic!



Working on the Innards of the Mechanical Cow. Insert Sl the Finished Bovine.

There really is no secret to the means by which i cow operates. She is electrically powered. And "life-likeness" is assured by her manufacturers.

Where does this synthetic cow come in for a plac the dairy industry? Well, she has been found to in thousands of people to pause in their pretended h to be about business; to pause and gaze and look—n read advertisements which an on-the-job dairyma ice cream manufacturer has had set in the display in dow. Yes, even the hustling crowds of our large m politan cities have been forced to stop, look and li They are attenton-getters par excellence and ca used in window displays with surety of impelling sands to read or look at whatever message a dairym ice cream manufacturer wishes to impress upon the minds of his city's inhabitasts.

Nearly everyone likes animals. Little childre their infanthood, learn among their first three wor speak of dogs as "bow wows." Many elderly, dig people, men and women both, will stop and lower dignity to speak or caress or pet a dirty, little, fo looking "bow wow." And a horse, or herd of cow flock of sheep, or even the smaller hen or more lowl will evoke words of astonishment when seen by a g of city dwellers passing through the countryside.

So these synthetic cows have the power of attra They arouse curiosity, evoke praise and people m at their "likeness" to the "Foster Mother of the H Race."

Of ourse, they are mechanical cows. Electricall op-

ANIMATED
Life-Like Cows
That Move Their Head, Eyes, Mouth and Tail

Messmore & Damon Inc.
407-A

On display at J. L. Hudson's Department Store, Detroit, Mich. Between 6 and 7 P. M. over 3,200 people stopped to view these animals.

At the Exposition we have registered 500 representatives from the largest dairies and ice cream plants in the United States, Canada and Europe, making actual sales to these countries.

These cows will secure good locations for your displays. They will work for you night and day, bringing increased business and reputation.

If interested, write or wire for full particulars.

Messmore & Damon, INC.
404 West 27th Street New York

erated, man-built. But they are probably more ne perfect than the synthetic stuff which has given, in past few years, so much prominence to the term: thetic.

They are manufactured by a New York firm w specializes in making animals, and which has achi national fame and reputation.

And now every milk dealer, every ice cream manu turer can have a little cow in his plant, or on dis where its advertising value will be the greatest.

COLLECTION METHODS WHICH COLLECT

(Continued on page 27)

fane, with the net result that not only does the collec letter fail to bag its game quietly, persistently and sistently, but it loses a valuable customer—more quently than it brings home the mustard. And so out goes collection letter No. 3:

"I like to see you coming here regularly to make chases, but I see by your account that you have sto buying here.

"Now, I don't want you to do that, but I do want to settle up your account as quickly as possible, ei by large payments or smaller ones, but do it regula and get started right away. The sooner the better.

"Frankly speaking, I don't like the collection en this business. I like to see you make purchases and as promptly as you can. Telephone me why you c pay and I'll make all reasonable allowances, or sen a check in part with a promise to pay the balnce— when.

"That will make you feel better—and me too!"

"This sob letter, as it might be called, gene makes the customer most apologetic for the delinqu and secures the necessary promise which enables m shelve the account temporarily until the date set for ther payments. Invariably I secure a small check, a promise.

"At this point many others would no doubt use belaying pin on the heads of the debtors, instead of u subtle psychology to drive home the idea of paying **paying now.** And so they rile the debtor, ruffle feathers, and, instead of paying the debtor becom fighting cock or a stubborn mule, as the case ma All the debtor can see is red, and the writer of that l is gored and impaled on the horns of a further dile —suit or charging off the debt.

"However, for those still failing to reply, this l now goes out five days later:

"Back in the Stone Age, records were carved stone slab. When the debt was due, Mr. Creditor sented the account in a very polite fashion—holdin slab in one hand, while in the other he carried his mallet. The debtor had no alternative.

"Today, there are the courts, quick judgmen seizure of property, or a making-it-impossible to again hold property, real or personal, in your name that judgment is satisfied.

"What a penalty to have hanging over one's simply from letting an account grow stale!

"Frankly, I'm getting to the end of my rope Will you compel me to sue or will you now answe letters and pay something on your account? You until next Tuesday to attend to this matter. I'm going to wrie you any more letters."

"This method generally gets what it goes after. ical treatment is now clearly essential. I must pu tooth out by the roots—just simply eradicate th

count from my books or put it in litigation. And so this letter concludes the final ceremonies. Generally, by that time I'm down to rock bottom anyhow and have only a few dozen accounts left out of a big stack.

"This is, of course, the final straw which breaks the camel's back, and to court we go if it is worth the struggle.

"By continuous pressure and shortening up the gap in collections, I find that I can bring up my cur collections to a surprising degree, and my system r be said to be just about eighty-nine per cent succe in getting accounts paid-up, or partial payments r and in the remaining cases—well, it was just an bum credit risk, and if the debtor is worth anythi all or has prospects of ever paying, we haul him court and let him tell it to the judge."

Getting the Story Over to the Consum

California Milk Company Uses the Sort of Direct Advertising That Convinces. Telling an Old Story in a New Way

THREE pieces of advertising literature have come to our desk from the Excelsior Creamery Company of Santa Ana, California. They are used in direct-to-the-home soliciting, and are effective.

One is a small blotter—always useful in the home, and always good advertising. A cut of a football player occupies at least half the space, supplemented by these words:

"To hit the line hard drink plenty of pure, rich milk—at least a quart a day. Excelsior Creamery, phone 237."

A poem, entitled "A Modern Milking Song," adorns the second piece of literature, and reads as follows:

The milkmaid's song
Is far too long,
  The swain's not through his haying;
The pale moonlight
Dispels the night
  And starts the curs to baying.

The milkmaid's gone,
The milking's done,
  No more such temporizing;
The game's too big
For any prig
  Takes work of men's devising.

No cow can wait
Before a gate
  Some maid and swain are swinging;
The milking's done,
The milkman's gone,
  Just see the full pails swinging.

'Twas all in vain
The maid and swain
  Took so much time in thinking;
We hope the maid
Convinced the jade
  But we want milk for drinking."

The third piece carries the following strong appeal and is, we believe, the sort of argument that convinces:

We invite you, if not already a customer of ours, to become a user of our rich, sanitary Dairy Products.

This company started the Pasteurization of milk in this county. Those who have made a study of the milk problems in cities know that this celebrated method of treating milk has added **safety** without removing any value from the product.

Our bacteriologist makes daily tests of milk to determine its quality and cleanliness. We alone can offer you this high degree of service.

All dairy herds are regularly inspected and—

Tuberculosis Re-Actors (if any) are Disposed of at Once.

We positively will **not** Pasteurize infected milk, even tho' the process will destroy the T-B germ.

Every herd as well as our modern, complete plant are open to your inspection at **any** time.

The growth of this company has been rapid. This is due to the appreciation of the people for our success in keeping the standards of all our products of the highest qu We appreciate business enough to try to deserve it. T a-day service, if you want it.

Cream, Protein, Milk Sugar, Minerals, Vitamines, th main elements in milk, are present in our milk in the p quantities for balancing it as a nourishing, pleasant

SOLVING YOUR COLLECTION PROBLEMS

By Amos Shaw Place.

Problem—We have not sufficient collection bus by a great deal, to justify us in employing a profess collector. In fact, our margins are such that any sonal visits to collect cost us more than condi justify.

Solution. Combine collecting with selling. I normal operation of any business granting credit, sions are bound to arise calling for a personal visit t delinquent. A system which has no regular pract respect to such situations all too many times d action on them, and losses are sure to result. The tion of the problem I have found in most successf is a combination of collecting and selling ability i same man.

It simply means that the business takes a sale and teaches him how to collect, or a collector and te him how to sell.

In an ideal situation the employee is equally c tent in both respects. In practice, this condition s obtains, because the psychology of collecting and ing diverge sharply. Salesmen are disposed to be lenient with parties whom they hope to sell or to as customers. The trained collector usually lac enthusiasm and mental attitude of the salesman.

The "answer" is usually keen supervision man, whichever the type to which he belongs. Sal can be made to collect with at least reasonable r if instructed and controlled. A good collector c taught to at least make suggestions for purchases acquire information which can later be used as th of selling effort. Report blanks which require th to report on every interview from the selling and c ing angle have proved good stimulants.

If selling and collecting are combined, the c the latter can usually be brought within reas limits even though personal solicitation be used.

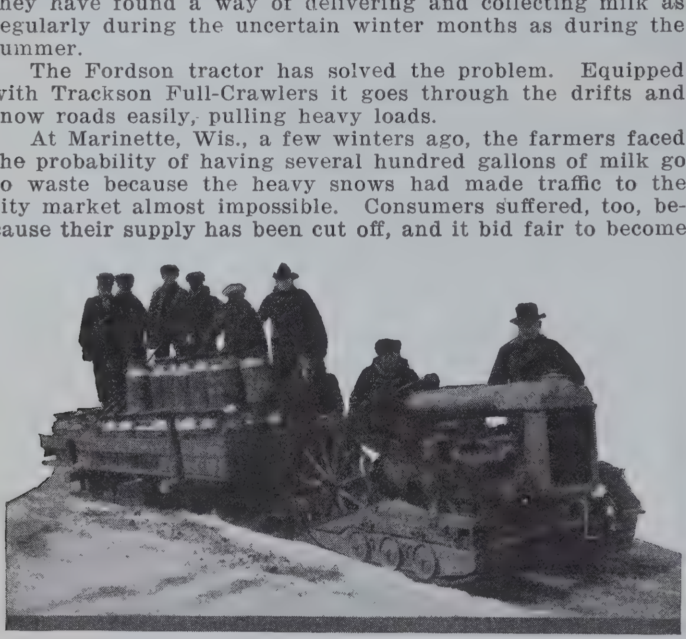
PLOWING THROUGH THE SNOW DRIFTS.

Certain Wisconsin milk companies and condenseries are no longer daunted by winter weather and snow drifts, for they have found a way of delivering and collecting milk as regularly during the uncertain winter months as during the summer.

The Fordson tractor has solved the problem. Equipped with Trackson Full-Crawlers it goes through the drifts and snow roads easily, pulling heavy loads.

At Marinette, Wis., a few winters ago, the farmers faced the probability of having several hundred gallons of milk go to waste because the heavy snows had made traffic to the city market almost impossible. Consumers suffered, too, because their supply has been cut off, and it bid fair to become a regular milk famine until the Trackson-Fordson saved the day by hauling sled-loads of milk through the drifts to the market.



Hauling sled-load of milk with Trackson-Fordson at Marinette, Wis. On one trip the crawler-tractor pulled two sled-loads or sixty cans of milk through drifts as deep as seven feet.

A condensery at Marinette has been able to collect from the farmhouses regularly every day during the past two winters, by using the crawler-tractor, thus keeping up production as well as during the summer.

Inspired by the success of these companies, the Merton Dairy Company last winter asked the Raab Motor Company of Milwaukee, Wis., to help solve its winter haulage problems. The dealer suggested a Fordson with Full-Crawlers, the unit used at Marinette, and took a machine to Merton for a demonstration.

Carleton Sperry of the Raab Company went to Merton a few days after a very heavy snowstorm, when the snow had drifted and packed very hard. The crust on the drifts was so thick and hard that men walked on it without breaking through.

The road to be plowed in the demonstration was a stretch on a hillside with a southern exposure, where the drifts had piled in uneven depths. At no time was the pressure equal on both sides of the plow. In a half hour the machine had made three trips over the worst half-mile of the stretch.

The strain on the Fordson was so terrific that it seemed impossible that it could stand up under it. In going through the first time, the driver charged into the snow as far as the tractor would push the plow, then backed up and charged again, and so on. Eight feet of the road were opened up in this way, and trips along the sides opened up four feet more on each side. Most of the plowing was one-sided and the tractor frequently had to back up, half turn, and make a sort of cut-out on the north side of the road, where it was badly drifted, to get straightened out on the road again.

Another milk dealer who uses this system for winter delivery is Frank A. Nelson, Tomahawk, Wis. When the snow makes other means of hauling impossible, he uses his Trackson-Fordson to haul milk, oil, and gasoline to lumber camps and dealers. He covers his forty-six mile route in all k of weather, making the trip with the crawler-tractor in s hours.

The Full-Crawler for Fordsons is manufactured by Full-Crawler Company, 500 Clinton St., Milwaukee, Wis

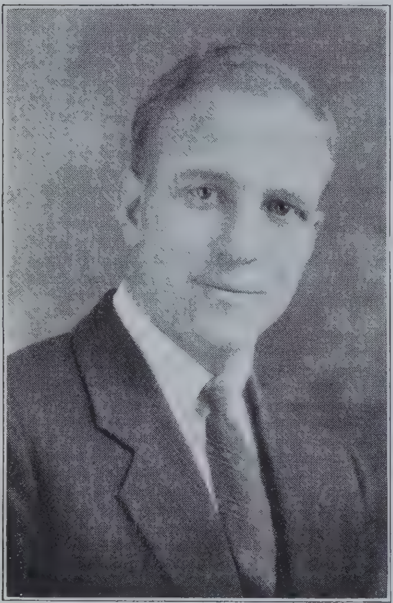
TRUOG JOINS MOJONNIER BROS. CO.

Mojonnier Bros. Co. announce the appointment of George A. Truog as their Western representative to succeed H. J. Liedell, who has been transferred to the New York office.



G. A. TRUOG

Mr. Truog will make his headquarters in Oakland and it is his plan to call upon the company's customers and prospects on the Pacific Coast. Mr. Truog is prepared to render service either in the laboratory or upon operating machinery, as well as promote the company's sales.

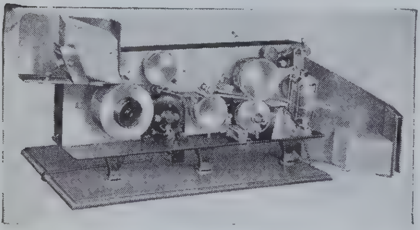
For the past several years after leaving college, Mr. Truog has been specializing in dairy chemistry in the ice cream and butter field largely, so he is perfectly competent from dairy products manufacturers' side as well as from the supplymen's side.

Mr. Truog's temporary address is Plaza Hotel, San Francisco, but he and Mrs. Troug plan on making their permanent residence in Oakland.

* * *

STANDARD MAILING MACHINE.

A machine manufactured by the Standard Mailing Machine Co. of Everett, Mass., will undoubtedly prove very popular, as well as profitable, among those plants sending out as many as 300 pieces of mail every day. The machine is so designed that it will seal, count, imprint and postmark, stamp mark and cancellation mark, and the saving of labor entailed quite readily pays for the machine within a short time. Many users also point out that it makes more rapid postal service, inasmuch as the letters go direct to the sorting rooms as soon as reaching the postoffice, which is especially valuable at the rush seasons in the postoffices.



Another advantage of the machine is that letters present a very pleasing appearance after such a machine has been used, rather than the marred letters which are so usual when they are postmarked at the postoffice.

The same company also manufactures envelope sealers and a machine for affixing stamps.

* * *

CHANGE NAME TO AMERICAN MOND NICKEL CO.

The American Nickel Corporation of Clearfield, Pa., announce that after December 1 their name is changed to the American Mond Nickel Company. There is no change in the officers and personnel.

* * *

NEW BOWMAN PLANT AT MAYFAIR.

Three Meyer Dumore bottle cleaners were installed in the new Mayfair plant of the Bowman Dairy Co. of Chicago. The new installations brings the total to 19 Dumores now in use in the various Bowman plants.

CHICAGO FIRM BUILDS ADDITION.

Announcement has been made that the Milk Bottle Cr Company, 1543-45 Kingsbury St., Chicago, has complete substantial addition to their old plant.

The extension, which is of red pressed brick exterior approximately fifty feet square, three stories and baseme running directly to their own switch track, where from vator or from spiral chute and roller conveyor, finished crates are run right into a car or to dray.

In the layout of this plant, attention has been given to the subject of light, and the building above the first floor has light on all sides. Large skylights have also been installed. The building is being equipped with an automatic sprinkler system.

Through better arrangement, added machinery, conv ors and the like, it is figured that the manufacturing capa of the plant has been doubled and economies of operat which may be passed to customers have been effected. St of finished crates of all sizes and kinds will be carried, abling the quick filling of ordinary orders.

J. H. Stoddard is president of the company; Robert St dard, vice-president and general manager, assisted by son, Robert Stoddard, Jr.

Messrs. Stoddard say "that in labor saving devices spe machinery and 'short cuts' to beat the spectre of overh that even Henry Ford has nothing on them."

* * *

OAKITE SERVICE MEN HOLD CONFERENCE ON INDUSTRIAL CLEANING.

The field service men, technical staff and executives c prising Oakite Products, Inc., will hold its tenth annual c ference in the general offices at New York December 6t 10, inclusive. On this occasion the field service men co from various parts of the United States and Canada to x change experiences and ideas and to hear and discuss tec i cal papers on various phases of cleaning.

Eighteen different technical papers will be presented v ering a wide range of subjects, among them being papers d l ing with Oakite methods employed in dairies, bottling pla s laundries, electrotyping and lithographing plants, texle mills, etc.

December, 1926, will mark the eighteenth year of e business life of Oakite Products, Inc. From a small gr p of three men in 1909, it has grown into the present large r ganization.

SOLVING YOUR COLLECTION PROBLEMS.

By Amos Shaw Place.

Problem: Every little while, in one way or anot
we find a customer owing us a trifling amount, anyt
from 5 cents to 75 cents or so. Suing for such amo
or paying them is a nuisance.

A prominent banker of this writer's city—name
nished on request—received some time ago a special
livery letter, the envelope carrying the return card
business located just across the street. Decidedly
ous, the banker opened the envelope. Within, he fo
a statement—it showed he owed the sender the w
sum of 5 cents.

10¢
5¢
50¢
20¢
25¢
BILLS
15¢
ACCOUNTS
Business man
F J D.

It's hard for him to keep those trifling amounts off his books

And in a note, personally written in pencil, the
itor solemnly called attention to the charge and "ho
the banker would meet it at once.

The banker did. Taking along a gift cigar, he
right across the street and paid the charge. For a
minutes, it was the most important business he had.
men had a mighty good laugh, and friendship and
will on both sides were strengthened. The credit
man with a sense of humor, had seen the good will
sibilities in the situation and had capitalized them.
in a "business like" manner, the trifling charge was a
en care of.

This "advertising" handling of petty balance i o
way. It is a good way, dealing with a great
customers.

Still another method, of course, where the cust
has more or less dealings, is to carry the charge ov
another month, when there will be other charges to a
to it, the whole making a respectable bill.

An improvement in some ways on this is to e
printed name list. The wording on this notifies th cu
tomer of the trifling balance—says paying of the an u
would be a nuisance of the debter—and explain t
charge will be added to the first purchase made b t
customer. With a great many customers, this is pe ec
ly sound procedure. The trifling amount is even al
collected, and in addition a nice little thing to build o
will has been done.

SECRETARY'S REPORT SHOWS SPLENDID PROGRESS.

(Continued from page 25)

requests coming into the various offices from school teachers.

Normal Schools.

In addition to the demands made upon us by the present school teachers we are finding an ever increasing demand from normal schools where young women are being prepared for the teaching profession. A large percentage of the normal schools now in the country are using dairy council literature and are adopting dairy council methods of teaching health. With these young women properly trained it will mean ever greater results than ever before in promoting health and fortunately for the dairy industry, health teaching always results in a greater use of dairy products.

New Activities.

Council activities have been extended in various ways during the past year, one of which is the establishment of the publicity department.

This department issues the Dairy Council News once each month, this going to over 5,000 important people, including all the health commissioners, the leaders in the dairy industry and others especially interested in council work. Also from the publicity department comes the Household Nutrition Sheet designed for use by household editors in the various daily and weekly newspapers throughout the country. This sheet contains the latest information on health topics and from it the household editor is permitted to clip such information as desired for reprint in the various newspapers. This nutrition clip sheet goes to 3,000 people including the editors of over 1,200 daily newspapers, to every farm paper, to all dairy journals, to all railroad magazines for employees, to all feature press syndicates and to all weekly newspapers in dairy council territories. In addition to this the publicity department has sent out 56 special releases during the past year.

Extensive work is now being done with the 4-H Boys' and Girls' Club organizations which have a membership of approximately 600,000 boys and girls in all parts of the country. The dairy council health program is being incorporated into their program with splendid success. (This work began in the state of Iowa and is spreading rapidly.)

The Quality Control Department.

Although not a new department the work of the quality control department deserves special mention. In Philadelphia there are 13 men and in Pittsburgh 3 who vote their entire time in improving the quality of m Chart No. 6 shows the improvement which took plac the milk supply i none of these cities in the first yea work. In addition to the sediment test which shows amount of foreign material in the milk, the methyl blue reductase test is now also being used to detern the keeping qualities of the milk; also, Dr. Breed's di microscopic test is being used. As a result of the nounced improvement in the milk supply of Pittsbu for example, the requirements made of the farmers h been raised so that in order to produce Grade A m the farmer must have a bacterial count only one-t as high as formerly required for Grade A.

Other Department.

The other department, including the dramatic dep ment, nutrition department, exhibit and display dep ments, and others are likewise doing excellent work.

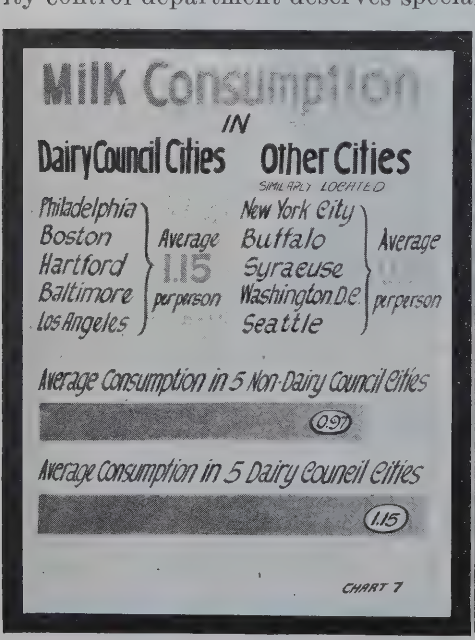
Results.

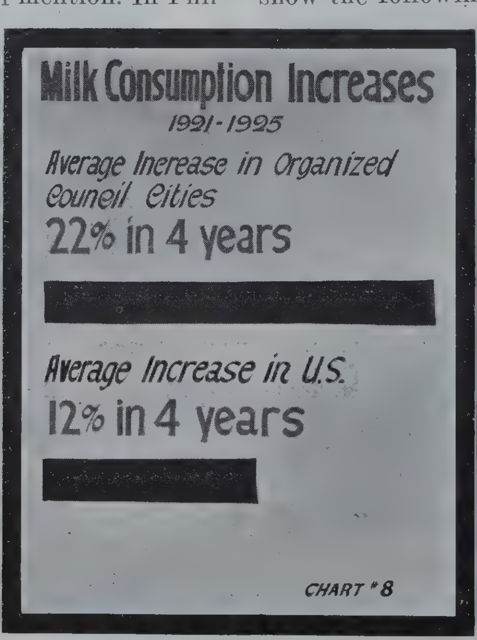
There are several ways of measuring the result dairy council work, some might prefer to measure i terms of improved health, others in terms of increa consumption of dairy products or in various other w It can be definitely stated that dairy council work improved health conditions, that it has helped stabi the dairy industry, that it has and is bringing abo greater public appreciation of the high food value the relative economy of dairy products in the daily that it has and does result in a closer relationship tween all branches of the dairy industry, particul the producers and the distributors, that quality has improved and that consumption has definitely been creased.

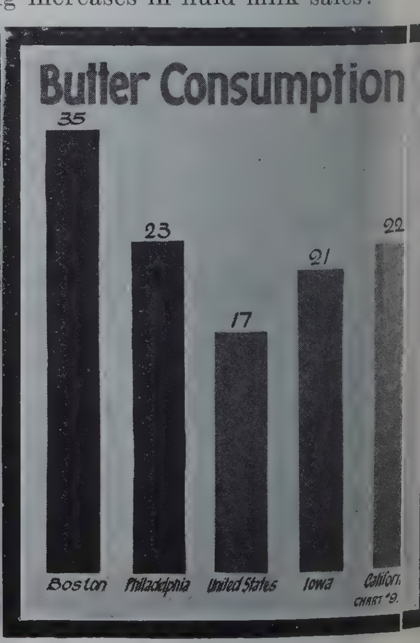
Time will not permit of a discussion of all t points, in fact only the last item. Increased consu tion will be elaborated upon. A few dairy council ci will be cited. Chart No. 7 shows milk consumption person in organized cities compared with milk consu tion in un-organized cities.

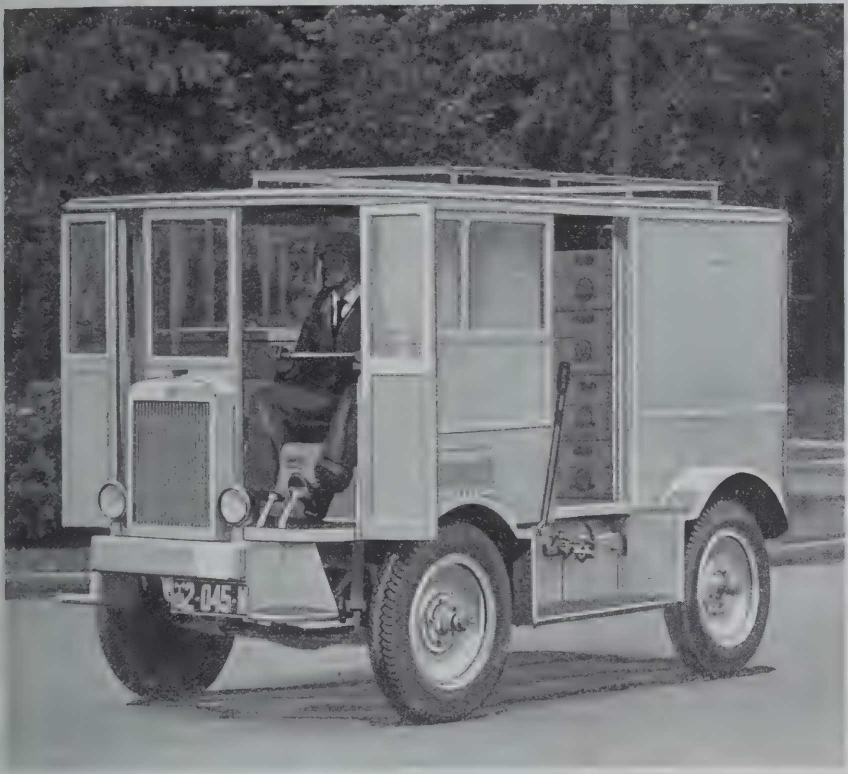
Results in Baltimore: The average daily sale milk in Baltimore in 1926 has been in round fig 17,000 quarts above the daily sales of 1925; this i increase of approximately 8.5 per cent in milk consu tion during the past year. The increase in milk c sumption in the schools in Baltimore during the a year has been approximately 25 per cent.

Results in Pittsburgh: Six representative de show the following increases in fluid milk sales:









Three point control enables driver to start or stop from the front or either side. Also unloads from front, rear and either sides.

DIVCO

The First Motor Truck to be Built Exclusively for Milk Delivery

NOT just an ordinary truck, but especially built for quick starts and stops from door to door. DIVCO three point control and slow-speed engine mean easy handling, low operating costs and exceptionally long life.

Many tests have proved that DIVCO will do the work of two horse drawn wagons in less time and at less cost per month. The load—as much as a man can deliver—is accessible at four places.

In our booklet, "FROM HOUSE TO HOUSE WITH DIVCO," are shown actual comparative delivery and operating costs on various sizes of routes. Write for it; it's free.

No.440

1921	105,181,000 pounds.
1922	115,046,000 pounds.
1923	125,317,000 pounds.
1924	128,637,000 pounds.
1925	132,353,000 pounds.

This is an increase of 25 per cent in four years.

Results in Boston: In Boston it is very hard to just exactly what the increase in sales has been; ever, statistics show that the increase of shipments the Boston markets to the same shipping stations an approximate gain in four years of 18 per cent; thermore, the five largest dealers according to sworn statements on file in the office of the milk ad istrator show their sales of fluid milk to have incre an average of 23.57 per cent during the four year p 1921 to 1925.

Other dairy council territories show similar re Chart No. 8 shows the increase in milk consumpti organized council cities to have been 22 per cent d the past four years, compared with but 12 per ce an average for the United States.

Another interesting comparison on consumption cannot help but prove the value of dairy council is shown by comparing the butter consumption in council territories with butter consumption for United States as an average. Chart No. 9 shows in Philadelphia the consumption of butter is no pounds per person as against an average of 17 poun the entire United States. In Boston the average sumption of butter is reported by the United government as 35 pounds, in Iowa the per person sumption of butter is 21 pounds and California r consumption as being 23 pounds. If figures were able to show the consumption per person in terri where dairy council work is not conducted nat the figure would be considerably lower than 17 p which is the average for the entire country. It is evident from statistics that dairy council work ha effective in increasing butter consumption as w milk.

The Future.

The future of dairy council work depends alm tirely upon the dairy industry. The schools, the wo clubs and in fact the public at large have expressed hearty approval, and their sincere desire to use th cational material now being put out by the dairy cil. Dairy council material fills a definite need i moting the health program throughout the entire try, and by continuing and enlarging upon dairy cil work there will result a great use of dairy pr improved health and a greater nation.

PACKAGE EXHIBITION AT BERLIN.

In conjunction with the assembly of the Assa of the German Dairy Experts, and international x tion of packages for milk and milk products will in Berlin, Germany, in August, 1927.

According to present plans, the exhibition wi the nature of a competitive showing. Cash pri be offered for the best exhibit in the different cl containers for milk, butter and cheese, in add diploma awards.

Information may be secured from the headq of Verbandstag des Verbandes Deutscher Molk leute, Berlin N. 4, Chaussesstrasse 8, Germany.

Novoid Corkboard Insulation

"The Choice of Careful Buyers"

There Are Two Sides to Everything—

—including NOVOID CORKBOARD, and you will find the *inside* exactly the same in quality and even, careful bake as you will find the *outside*.

Recognizing that "green centers," so disastrous to any insulation job only after the corkboards have been erected and in service for some time, *cannot be detected by surface inspection*, NOVOID CORKBOARD is made in double width molds approximately 25" x 37", so that each sheet, after being removed from the mold, is *split* longitudinally and then carefully finished to full standard 12" x 36" dimensions.

Thus *every* standard sheet of NOVOID CORKBOARD reveals to you both the *inside* and the *outside* of the original factory product, and the uniform chocolate color guarantees you against the possibility of failure in service from underbaking.

This advantage, found exclusively in NOVOID CORKBOARD, is obvious!

The 1928 World's Dairy Congress To Be Held In Great Britain

Preliminary Announcement by the General Committee of the Congress

THE dairy industry of the United Kingdom invites the official participation of all countries in the Eighth World's Dairy Congress which will be held in Great Britain in July, 1928. A preliminary announcement has just been issued by the organizing secretary of the World's Dairy Congress. He quotes as follows:

"The seven previous congresses of this kind have been of admitted benefit from the three-fold standpoint of international relations, the development of all sections of the dairy industry, and public health; and it is hoped at the forthcoming congress, by an interchange of scientific knowledge and the mutual discussion of industrial progress and problems in the milk industry, to intensify the good results already achieved and to make further solid contribution towards the attainment by all nations of a life of prosperity, health and peace.

"Milk is an essential factor in public health, and the provision of that food, pure and safe, has become more necessary but more difficult under modern conditions of life in congested areas. The problems thus presented, and many others connected with the use and manufacture of dairy products, must be solved before milk can fill its place in the building up and maintenance of bodily health.

"Towards this solution the forthcoming congress will, it is hoped, play an important part. It will also fulfill a further useful purpose by focussing public attention on the unique food properties of milk and on the advantages of an increased consumption of milk and dairy products. In no country has milk consumption yet reached the point which is scientifically recognized as desirable in the interests of human welfare.

"Thus from many different standpoints the World's Dairy Congress is worthy of support, and it is hoped that every nation will make some effort to contribute towards its success.

"The congress of 1928 will be held under the gracious patronage of His Majesty the King. The Right Hon. Walter Guinness, minister of agriculture and fisheries, and the Right Hon. A. N. Chamberlain, M. P., minister of health, have consented to act as honorary joint presidents. The Right Hon. the Lord Kenyon, K. C. V. O., is chairman of the general committee.

"The congress is already assured of the full support of the British government and is being organized in association with the International Dairy Federation.

"It is possible that sessions of the congress will be held in London, Reading, Edinburgh and Belfast. Excursions will be arranged to places of interest throughout the United Kingdom, and every effort will be made to present to the delegates and representatives in attendance a comprehensive survey of the organization and methods of the milk industry of this country.

The annual show of the Royal Agricultural Society of England, which will be held at Nottingham during the period of the congress, will afford visitors an opportunity of seeing the finest examples of dairy cattle in a country famous for its livestock. Dairying in all its aspects, including appliances, will also be made a feature of the show, which will thus provide business facilities of which some of our visiting delegates will no doubt wish to take advantage.

"With a view of making the congress thoroughly representative of every aspect of the dairy industr is proposed that the papers to be considered at the ous sessions should fall within four main groups:

"**Milk Production**—All matters bearing on the duction of clean, wholesome milk. The breeding, fee and management of dairy cattle—education and a ory work amongst milk producers—the techniqu clean milk production—economies of milk producti milk recording—the improvement of farming metho co-operative organization of farmers—young farm clubs, etc.

"**Milk Distributing and Manufacture**—Papers ing (broadly speaking) with milk from the time it le the farm until it reaches the consumer. Transport f ities—marketing—co-operative distribution—metho processing milk—manufactured products (butter, ch condensed milk, ice cream, dried milk, casein prod —dairy machinery—metals used in manufacture—st ardization of machinery—milk bottles, etc.

"**Milk Consumption**—The importance of milk i human dietary—propaganda to encourage the consu tion of milk.

"**Administration and Control**—In this category be included all aspects of official intervention in the industry whether by way of the promotion or subsid of education and research, or by regulating the c tions under which milk and milk products may be cessed, distributed or consumed.

"The general committee of the dairy congress, will welcome the attendance of all who are concern the subjects which the congress will discuss—wheth producers, distributors, scientists, physicians, healt ministrators, welfare workers, philanthropists or sumers.

"Eminent authorities from the British Empire from foreign countries will be invited to deliver p to the congress, and there will be free ventilation discussion of the latest knowledge and discoveries ing to milk and dairy products. All accepted paper be printed in English and such other language as be deemed advisable, and circulated before congress."

Further information can be obtained by writing Olsen Publishing Co., Milwaukee, Wis. We have o tablished representative and branch office in Londo will keep in close touch with developments.

FORT WAYNE INDIANA

ANNUAL MEETING OF THE NATIONAL DAIRY COUNCIL.

(Continued from page 23)

last year, without further effort on our part, we found ourselves swamped with requests for exhibits, that we could only meet to the extent of 100 this year, and had we had the equipment, and the workers, we could have probably doubled up on that this year. What the coming year is going to be I can't predict.

An Example of Demands.

"I do realize, by the requests that are now coming in, that it is going to be terrific on us. Here is an interesting thing. In 1925 I think we made one exhibit in a state college or university. In 1926 we made 20 exhibits and couldn't comply with all the requests. Those are not just exhibits for a day; some universities or colleges have taken them for a week, two weeks, three weeks, and they are up there for educational purposes.

"We have set up some of those exhibits for this meeting. Take this exhibit right here, which we call the School Room Exhibit. I will refer only to that one exhibit. Here is an exhibit that tells a story. There is a bulletin board in the form of a blackboard which is continually changing, which tells the story of the relationship of milk and dairy products in this balanced health program. It is a typification of some school children with a teacher and a map on the wall, what we call our school room exhibit.

"We completed that exhibit late in the winter. As I recall the figures, in 12 weeks we made 19 exhibits of that kind, this window school room display, in various educational groups, conventions of health workers, medical people, dentists, educational meetings, etc., and it has been out during that time every day, only in the central office long enough to get it shipped out again, and yet we could not meet the demand for it.

"That is just one exhibit. It has gone to colleges, educational institutions, conventions and so on. Other exhibits the same way. There is what we call the Health House exhibit in the back of the room. We try to put up all the food that should be eaten, as Dr. McCollum tells us, to balance up our diet to conform to a proper health program. We put those things on the roof,—the whole grain cereals—and on the sides the vegetables and fruits, etc., and we have the dairy products. Study that exhibit. It will interest you. That is a health house and the child who conforms in his habits of eating with what has been pictured in that house will thrive and develop in what we call the health house and will be healthy if he observes other health requirements, like sleep, rest, fresh air, etc.

"Requests from unorganized territory are piling in on us in the national office. Comparing the three months of last year, the first three months of our year's activities, there is an increase of November, 1926, over November, 1925, of 285 per cent, requests that have come in to the national office for our material to be used in schools, just requests for materials in schools—outside the unit territory. In 1926, during that month we received a little less than 6,000 requests, as against a little over 2,000 requests in 1925, and this period, you see of three months shows 219 per cent increase in 1926 over 1925.

Increased Needs Each Year.

"I put this month on to show you that this is a cumulative thing. Here are the three months in the one case and the one month, the last month, the month of November, so that what December is going to be, or January, I don't know. If it keeps up with the percentage of increase that has taken place between November, and November, 1925, we've got to move out in the for more room in our office.

"Many things have taken place in this industry. will hear on this program today a talk by Dr. McCo who will have something to say about some of the things that have come up in the nutritional field re ing our products and you will hear from Dr. McCo the research work being carried on in factories i city of Cincinnati that will be very illuminating.

"But I noticed this: I happened to be in Buffa the convention of the American Public Health As tion. There were some 1,400 or 1,500 health repres tives there and the year before they had appoint committee on the subject of the relation of dairy ucts to health throughout nutrition, and Prof. She was chairman of that committee. They carried on siderable investigational work during the year. T port of that committee was read by Dr. Sherman at convention. I'm not going to read the report, other an extract from it. This report recites:

> 'Present information as to cost and value ma quite clear that the entire community would sav pense and serve their nutritional needs best much as one quart of whole milk were used as for each member of population daily.
>
> 'We can go further and say that it is indispen to steady growth and development of childre least until they reach school age, that a quart of should enter their daily dietary.
>
> 'We can add a third summary of the situati the effect that unless at least a pint of milk pe son is used in a community, waste of income an ous nutritional errors are going to develop and the vitality, sturdiness and capacity to resist d of a large number of both children and adults.

"Then a little further on they make this comme

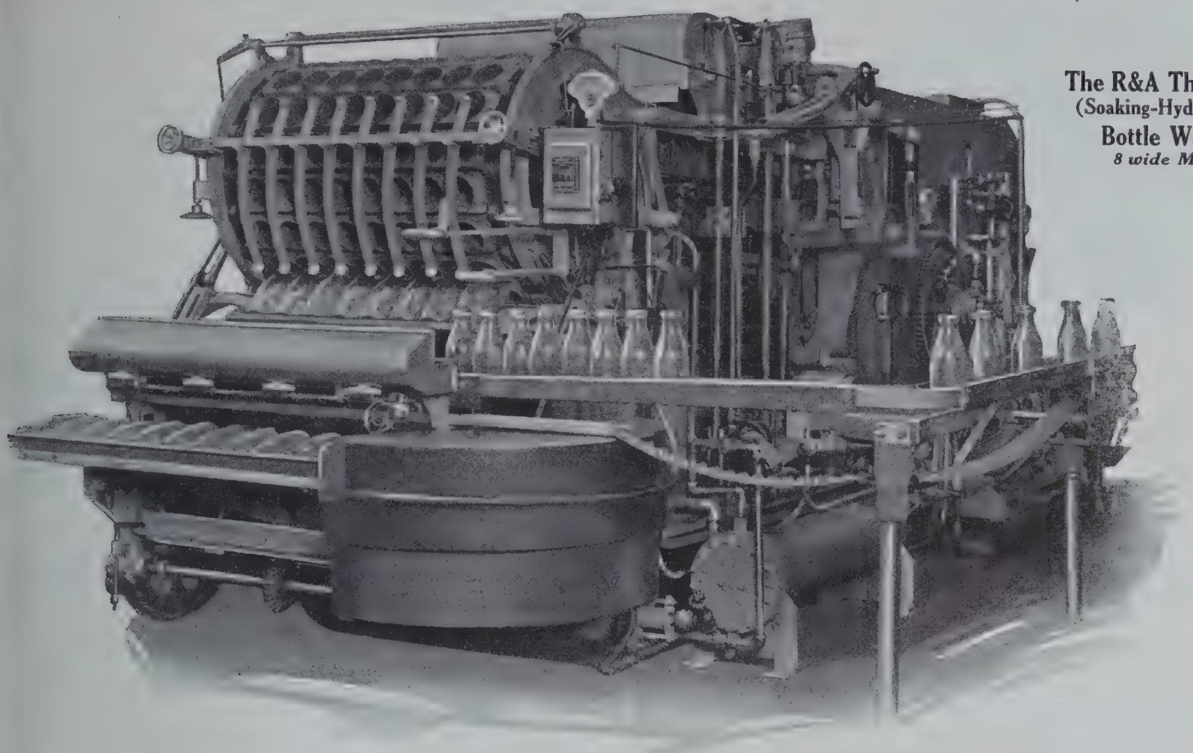
> 'Your committee feels that very special emp should be laid upon the fact that the best int of the public health demand that the activit public authorities in common with milk pro shall be such as to lead to increased milk con tion. This means that we should seek to sim rather than to elaborate, requirements of mil sumption so that the real essentials may be effec emphasized.'

"Here's the report of a committee to a na health organization. Do you sense the far-rea effect of that in the industry? Do you see what a ulus that should be to further endeavor of the organization and efforts? Do you see that that re added support?

"I often wonder why others don't see the val need of this work as it appears to me. I sometim myself, 'Am I getting over-enthusiastic on this su Is my vision of it so warped that I haven't the rig ception of it?' I can't believe that is true. Pos am unbalanced on this subject, but I was glad t that Dr. McCollum agreed with me. That is a scientific assurance that I am not clean, plumb on it.

A Challenge to the Dairy Industry.

"Can't you see what an opportunity there is We have had enormous development in the past 10 I rather suspect that without reflection at all upo in this industry that have been forward-lookin you have been so busy keeping up with the cr business on your various endeavors that you have



The R&A Three-Way
(Soaking-Hydro-Brush)
Bottle Washer
8 wide Model

We said, *"A Great Bottle Washer"*— Users say, *"The Greatest Bottle Washer!"*

NOT our opinion but the opinion of the users is what proves the unusual efficiency of the R&A Three-way Bottle Washer.

In actual service, it takes the dirtiest bottles, thoroughly washes and rinses them, delivers them sparkling clean and ready for the bottlers—and does it swiftly, surely — without hitch or miss—with a minimum of power and labor.

From the start, we have claimed that the Three-way was a great bottle washer. Now, users acclaim it the greatest bottle washer.

Ask These Owners

J. E. HARSHBARGER

SANITARY MILK & ICE CREAM CO.
Peru, Ind.

If you are interested in getting clean bottles, we invite you for your own satisfaction to investigate the Three-way thoroughly.

Compare it, point by point with other good bottle washers. Ask Three-way users what they think of the washer. Ask them what kind of bottles it turns out.

If a Three-way owner is anywhere convenient to your city—or if you can spare the time to come to Buffalo—we will gladly let the balance of the evidence rest with the washer in actual operation.

Meanwhile let us send you complete literature.

RICE & ADAMS CORP.

1144 Military Road, Buffalo, N. Y.

time to think of this but the period has now arrived, men, when you've got to stop and think of it. Otherwise, you're going to have a reaction here somewhere.

"If this organization, through its unit activities and its central office, can't go on and meet these demands that these charts show are piling in on us, there is only one inevitable thing to follow and that is retrogression in our efforts and I am convinced that the value of these efforts is such that it will amount to retrogression in the industry if that comes to pass.

"I've tried to give you a little vision of the national aspects of this industry. Here we are absolutely entrenched in scientific fact as shown by talks that you have listened to in other meetings and extracts of the report of the Health Convention I have read to you, by common every-day observation and experience. We have opened up to us, as shown by another chart, every avenue of valuable activity in which we can spread this knowledge and here we are in an industry golden with opportunity, and I wish I could say rich in endeavor!

"The future of this industry, so far as its development goes, I believe is in the hands of the men who are in these circles between production and consumption and those manufacturing equipment necessary to market these products, and the proper relationship that we shall sustain in our educational endeavors between the consumption circle on one side and the production on the other. That can't be done without absolute, sincere support from every one in this industry. We haven't got that yet—far, far from it!

Few Men Responsible for Start.

"This council would not be in existence today if it hadn't been for a very few men, and it wouldn't be able to carry on now excepting for a very limited number as compared with all there should be in. It is in your hands, men, and I am speaking to those of the industry in this room. It is in your hands as to what this future is, absolutely, and there is not only in your hands what the future of this industry shall be but there is in your hands the absolute welfare, the development, the future of the children, the men and women of this nation, and without the development of those boys and girls into efficient men and women, with your co-operation, I see danger ahead for this industry that is almost unspeakable because a nation which has reached a point where its citizenry is so feeble mentally and physically that it can't rise to its opportunities, the opportunities the world presents, that nation is on the road to decay!"

WASHINGTON — MAINE

Notes From Far and Near

CALIFORNIA — FLORIDA

Chicago, Ill.—A milk distributing station is being ere by the H. Ronken Dairy Co., 131 Emerson Place. The bu ing will be 200 by 100 feet, and will be erected at 166 62nd street.

Chicago, Ill.—A two-story, 74 by 103 ft. pressed brick cut stone building will be erected by the Benson Dairy at 941 N. Cicero Ave. Gust Benson is president of the f which has its offices at 4842 W. Walton Place.

Cumberland, Md.—The Queen City Dairy Company cently purchased new machinery for their plant, and inclu in this purchase an automatic bottle washer.

Des Plaines, Ill.—The Des Plaines Dairy have rece made some improvements at their plant. They plan on stalling a modern milk bottle cleaner in a short time.

Du Bois, Pa.—Formal opening of the new plant of Du Bois Dairy Co. was held late in November.

Little Rock, Ark.—Terry Dairy Company recently m some new improvements to their plant, and, along with o new machinery, included an automatic milk bottle cleane

Maywood, Ill.—The Standard Dairy Company recently chased an automatic bottle cleaner.

Pasadena, Cal.—The Crescent Creamery Co. plans erection of a pasteurization and bottling plant to cost app imately $40,000. The company's main office is located at Winston St., Los Angeles, Cal.

Perth Amboy, N. J.—Puritan Dairy Company recentl stalled a power bottle cleaner in their plant.

Portsmouth, W. Va.—Arrangements for the construc of a big new milk distribution plant are under way. Ideal Milk Co. was recently incorporated, with Albert L ner, president; Robert Richardson, vice-president; H. Duis, secretary; Frank Jordon, treasurer, and W. D. M superintendent.

Red Bank, N. J.—Shrewsbury Dairy Company rec purchased a bottle cleaner.

Rochester, N. Y.—Brighton Place Dairy recently inst a large type milk bottle cleaner.

Rockford, Ill.—The Darrow Dairy Company recently chased an automatic milk bottle cleaner. The new purc became necessary with their greatly increased business.

Roseburg, Ore.—The Alpine Milk Co. is contemplatin erection of a condensed milk plant here. It has alread tained option on a site, 80 by 157 feet adjoining rail tracks.

St. Louis, Mo.—The Pevely Dairy Co. is reported to under construction a $200,000 condensing plant, one an stories high. D. C. Kerchoff is president of the com which has its headquarters at 1001 S. Grand.

Whittier, Calif.—Whittier Sanitary Dairy Company recently installed an automatic bottle washer.

"UNLAWFUL MILK."

ccording to a news bulletin issued by the Penn- nia Department of Agriculture, a practice of sep- ng and viscolizing the milk fat has been followed by milk dealers in the state. The practice has been parate the milk, viscolize or homogenize the cream hen add it to the skim milk. A very big cream line attained in this way. The practice is, of course, ned upon by the health authorities and has been de- d fraudulent.

e bulletin issued by the health department follows:

method recently devised and adopted by certain milk butors for making the fat content of milk appear to be as large as it actually is, by means of "viscolizing" is ud and will be dealt with accordingly, state officials e.

statement just issued by Dr. James W. Kellogg, director hief chemist, bureau of foods and chemistry, Pennsyl- Department of Agriculture, outlines the position of the officials, as follows:

he sale of so-called viscolized milk, as recently adopted rtain distributors, is declared by the officials of the ylvania Department of Agriculture to be unlawful and d on the consumers of milk.

Consumer is Deceived.

he process of viscolizing is essentially the same as that mogenizing, which is employed to increase the volume ty substances, such as milk fats, by the use of high pres- which has the effect of increasing the volume of space ied by the fats subjected to this treatment. When ap- to the fats in milk it extends the cream line to about nches so that the so-called viscolized milk has the ap- nce of containing about twice as much cream or butter it usually does. The amount of fat in the cream is creased at all and only deceives the consumer into the that the milk so treated is much richer in cream than rily sold.

he milk itself is not viscolized but only the cream or rtion of it, which has been previously separated and jected to this treatment and which is again mixed with im milk. The product is in fact viscolized cream and milk mixed together after having been processed. This ce is reprehensible and in violation of the code of ethics trade and 'a fraud upon the consuming public.'

'he milk law distinctly prohibits the sale of 'milk which ad the butterfat or any portion thereof removed there- n The general food law defines adulteration as an un- ul sale of any food product if it be so mixed 'whereby ge or inferiority is concealed, or so as to deceive or ad the purchaser; or if by any means, it is made to ap- better or of greater value than it is.'

Milk Defined.

ccording to the accepted definition, 'milk is the whole, clean, lactic secretion obtained by the complete milk- one or more healthy cows.' Therefore, milk which en subjected to a process of separating and viscolizing eam and re-mixed with the skim milk cannot be claimed ning within this accepted definition and the so-called ce of viscolizing and selling milk with a falsely ex- d cream line is considered as being in violation of the uements of the law and prompt action will be taken by partment against the unlawful sales of viscolized milk.

he position taken by the Pennsylvania Department of ulture, in reference to the sale of so-called viscolized k is approved by Dr. Charles H. Miner, secretary of health, nylvania Department of Health."

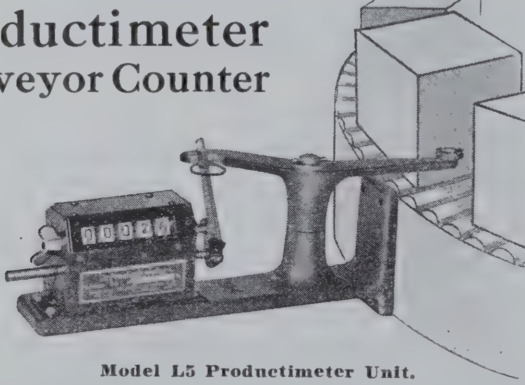
MICHIGAN SHORT COURSE.

The dairy manufacturing short course offered annually by the Michigan State College of Agriculture and Applied Science begins January 3, 1927, and ends March 5, 1927. The course in cheesemaking and the course in buttermaking are offered simultaneously. The student must therefore elect one or the other of these two; it is impossible that he take both. Previous experience is not essential, but is very desirable for students taking either of the courses.

In addition to special training by lecture and laboratory practice there are supplementary studies required. These include a course in Babcock testing and separators, creamery mechanics, dairy bacteriology and hygiene, dairy arithmetic and gymnasium. These courses are required whether buttermaking or cheesemaking is taken inasmuch as they have a direct relationship to both.

Board and room may be had in East Lansing, close to the college, at moderate rates. Board costs on the average from $6.00 to $7.00 and room $2.00 to $5.00 per week. There are ample hotel facilities in the nearby city of Lansing with ten minute street car service between city and college. Students who enroll in the course should first report to the short course office located on the first floor of the Agricultural Building where registration is taken care of and general directions given. The first day is given over to registration and location of quarters. The fee required for entrance is $5.00 for residents and twice that amount for non-residents. There is a health service fee of $1.50 which provides free medical and hospital service for anyone taken sick. Further information may be obtained by writing the Short Course Office, School of Agriculture, Michigan State College, East Lansing, Mich.

Counted As They Pass
By The
Productimeter
Conveyor Counter



Model L5 Productimeter Unit.

The Productimeter Model L5 Conveyor Counter provides a quick, easy, and accurate means of getting the count of boxes, pieces, or packages as they pass along the conveyor. Assures a mechanically accurate count and saves a man's time and wages. Unit consists of a standard 5B1 Productimeter equipped with a special mounting bracket and counting arm, ready and complete for attachment to any conveyor. Counts to 99999 and is easily reset to zero by a turn of the wing nut.

Send for special bulletin, giving details on this unit, and catalog describing 57 standard models of Productimeters for various applications, such as bottle counters, can counters, filling and sealing machine counters, etc.

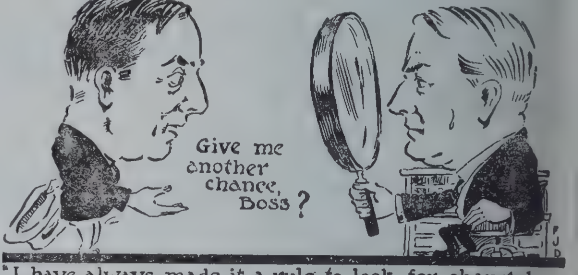
SHALL WE GIVE THIS MAN A SECOND CHAN

One fall doesn't prove a man is permanently do The practical employer realizes that, as well as the so worker. From the practical standpoint, though, w ought an employer do when an employee who has b fired once, for full cause, comes back and asks fo "second chance?" The sentimentalist says, "Give i him." What ought to be the attitude of an employ

It all depends. From the humanitarian standpo the former employee isn't helped if to hire him me shortly to fire him again. He may be actually hurt further damage to personal morale. We asked an employer, well known for his kindness, for advice pass on. This is what he said:

"I believe that most employers who give 'sec chances' find that usually the returned worker ag messes things up and has to be discharged. On pa



Give me another chance, Boss?
J D

"I have always made it a rule to look for changed conditions at this time."

the worker should feel such gratitude as to guara faithful, determined effort. In practice, he is quit apt to feel his employer is an 'easy mark' and act acc ingly.

"Most of us believe the safe side to err on is of justice and humanity to the worker. However, I always made it a rule to look for changed conditio the time of the employee's asked-for return. Is he same man, or a different man, at heart? What panions will he have, what supervision? What are conditions? I have observed a number of re-empl men who have 'come back,' and in most cases I found changed circumstances. This is particularly where the man has a new manager or 'boss.'

"Men fired by one employer often 'make good' another. The change in employers is usually respon All of us can bring out the best only in certain typ employees, and thos eare the types we ought to with.

"If conditions are changed, the man fired once be employed again with possibility of mutual profit.

CAUGHT ON THE WING.

Merry Christmas! Say it to yourself, think it, feel it, live it, spread it all around from now until the day when you can say it to everyone you meet—MERRY CHRISTMAS!

* * *

Spend little effort and you will have little else to spend.

* * *

Don't fail to try because someone else has tried and failed.

* * *

The peculiar thing about faith is that the harder it is attacked, the stronger it grows. Have faith in your enterprise and neither earthquakes nor hurricanes can destroy it.

* * *

The story is told of a paint manufacturer who had been decidedly lenient with all the dealers who bought from him on credit. A day came, however, when he himself was being pushed pretty hard for money, so that, when an order came from a fellow who had paid him nothing for several months, he wrote the dealer and told him he would have to pay his old bill before he could ship the new order.

Imagine his surprise when the following day he received this telegram, collect: "Please cancel o
Can't wait that long."

* * *

Blinders were put on horses to narrow their fie
vision—but the vision of human beings should not
limited. We need to get various slants on problems,
at them from all angles, and then decide for ours
which road to take.

* * *

We've often wondered who first coined a nam
a product by shortening each part of the trade name
ending the result with "co." The first such nam
could recall was Nabisco, but now we read that n
forty years ago the Smith Tool Co., of Pennsylv
conceived the bright idea of giving its produc
identifiable name—much as the parents of "an onl
who was born a girl" named her Henrianna, afte
father, Henry, and the mother, Anna. "Smitooco'
the not-pretty name thus coined. And it has surviv
this day, for the system, which a glance through th
vertising pages of any magazine will show you is
very much used, is known as the Smitooco Syst
Coining Trade Names.

When you watch a *CP* Ladewig in action for the first time, be prepared for the biggest surprise you have ever had. Many time honored theories of rapid and efficient bottle washing have been purposely disregarded in making the *CP* Ladewig. In making a washer that surpasses everything and anything seen before you can't use a bunch of old ideas. Therefore, the *CP* Ladewig embodies a different, yet sound, operating principle.

The *CP* Ladewig washing method is soaking plus *"hydraulic scrubbing"* and, oh man! how it does clean bottles! Although incomparably efficient, it is also relatively simple. Because we believe that a straight line is the shortest distance between two points, mechanical complications are avoided and skilled mechanics are not needed to keep the washer in service.

Regardless of the type, age, size or capacity of your present washer, if you have an open mind and are interested in lowering washing costs and getting cleaner bottles, get the facts on the *CP* Ladewig.

York Crates

Save Bottles---

¶ More money is wasted through bottle breakage than is saved by buying cheaper crates. ¶ YORK CRATES are fitted with metal strips to protect the bottoms, and corners are double nailed thru zinc angles. ¶ The flanged cross bars inside the crates are riveted together. ¶ There is no chance for any support to break or bend. ¶ We welcome comparative tests with YORK CRATES on bottle breakage, durability or any other point.

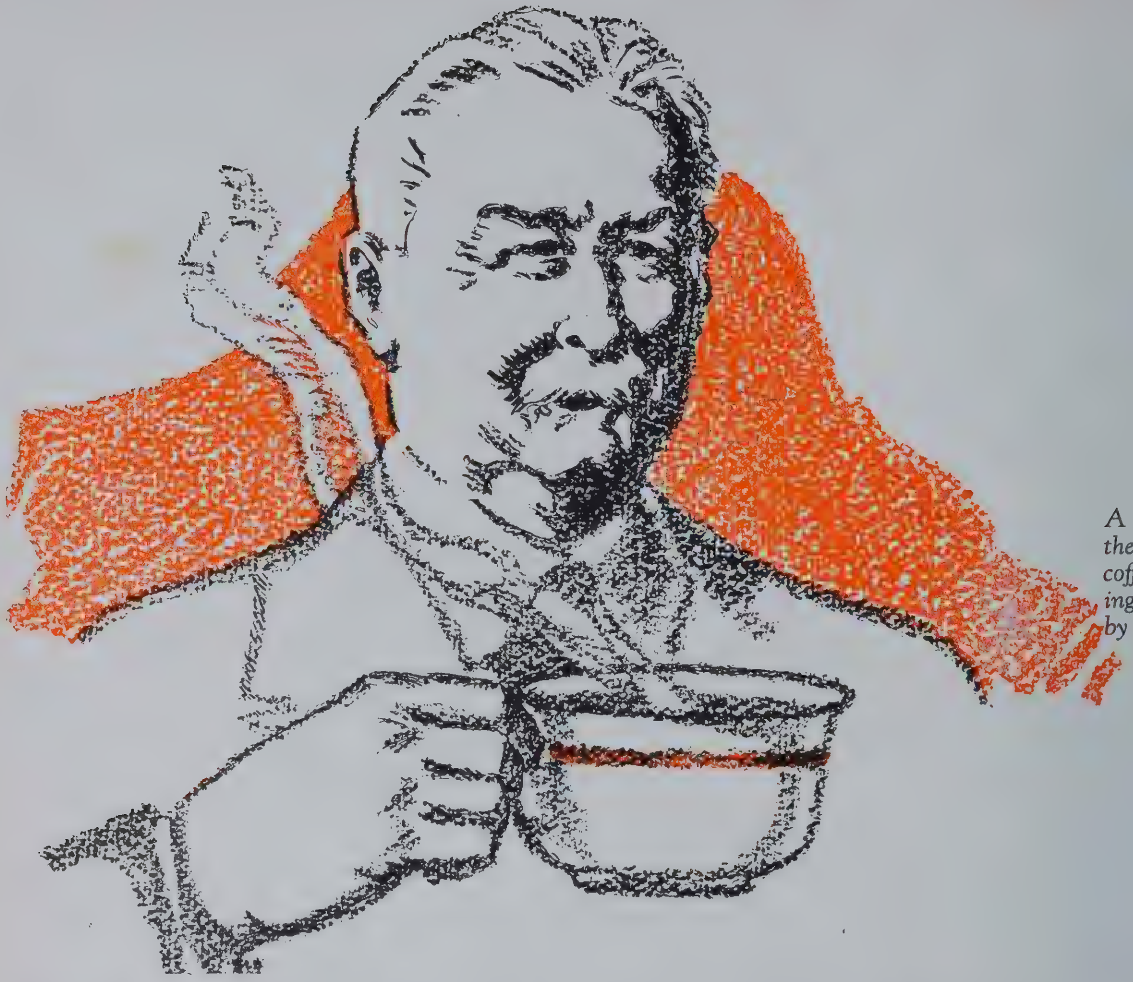
Volume 16 JANUARY, 1927 Number 4



A new milk drink wit
the invigorating tang
coffee; zippy and refres
ing; wholesome and like
by everybody.

All America Loves Coffee---
and now comes Coffee-Mi

Every day will bring you dozens of new customers for COFFEE-MILK in offices, shops, stores and homes.

America is the greatest coffee drinking nation in the world. That is why Coffee-Milk has such a wide, universal appeal—everybody likes it. And everywhere its popularity is spreading rapidly. Live milk dealers are increasing their milk sales with this tasty, quick-selling new drink—milk mixed with Arabian Brand Coffee Syrup.

Made from full flavored, fresh roasted coffee, highly concentrated in syrup form. Easy to mix with milk; no equipment necessary. Never settles at bottom of bottle; no sediment. Write for prices and sample.

D. ABELSEN & SON, - - Providence, R. I.

Central States Representative: M. C. DRESHFIELD, 405 East Main St., Kalamazoo, Mich.

To insure prompt reply when writing for samples or information, address direct to factory.

Sold in 12 oz. and 16 oz. bottles for home use and in one gallon and ten gallon jugs for milk dealers.

OUTHITT MILK POWDER PLANT

GRAY-JENSEN SPRAY PROCESS

Designed and Built by

DOUTHITT ENGINEERING COMPANY
139 NORTH CLARK STREET, CHICAGO
for

Land O' Lakes Creameries, Inc.
Litchfield, Minn.

Land O' Lakes Sweet Cream Buttermilk Powder Plant at Litchfield, Minn.

and O' Lakes Creameries, Inc. after making a thorough investigation of other types of milk powder plants purchased a Douthitt Plant because—

guarantee to recover on capacity operation milk owder equivalent to 100% of the solids in the milk. ter plant can make such recovery.

condensing necessary. In fact, no condensing water l. The only water required is for boilers and to wash p each day.

ne man necessary to operate plant and pack powder els.

lant is easily kept in absolutely sanitary condition be thoroughly washed and sterilized each day.

and instantaneously regulated to leave any desired age of moisture in powder.

ute from milk to powder; the shortness of time which the milk is exposed to heat insures superior of powder, entirely soluble in cold water, manufac- at lowest possible cost and sells for the highest price.

The powder is automatically and instantaneously removed from the drying chamber, also cooled as delivered into barrels. Other plants require from 1 to 20 hours to accomplish the same result. Milk powder allowed to remain in drying chamber until the day's run is completed becomes thoroughly mixed while being removed; therefore there is no advantage in grading such powder as the lowest quality made that day governs the grade for the day's run.

The extra recovery of milk powder, the saving in fuel, labor and power, as compared to other milk powder plants, is sufficient to pay for one of our plants in from 1 to 3 years. Manufacturers are discarding other types of milk powder plants and installing the Douthitt plant, the life of which is from 15 to 20 years.

We will furnish a guaranteed market for all Skimmilk Powder manufactured in our plants.

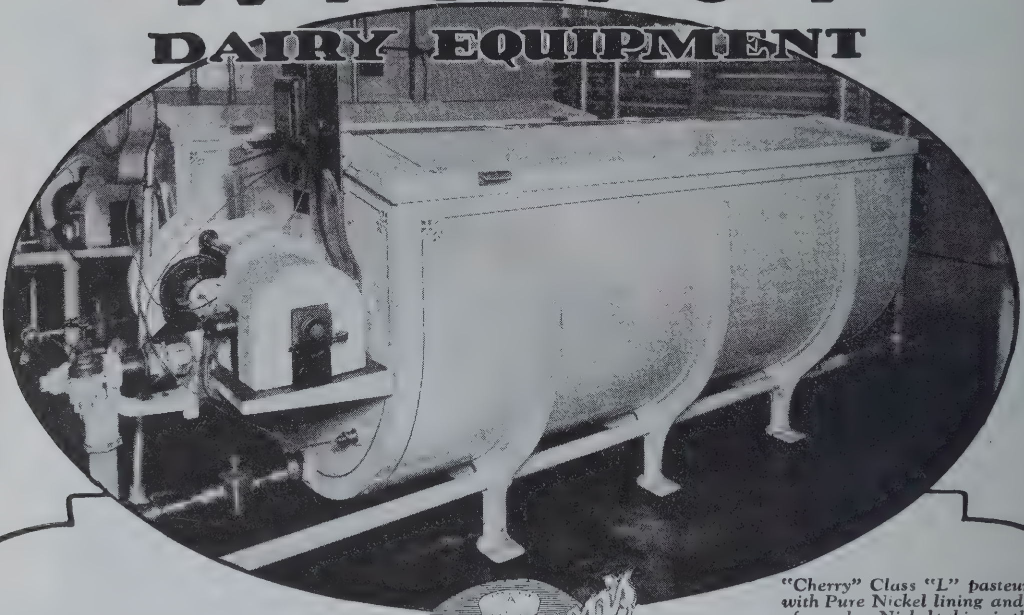
Another user of PURE Nickel DAIRY EQUIPMENT



"Cherry" Class "L" pasteurizer with Pure Nickel lining and coil of seamless Nickel tubing in the Janssen Dairy Co. plant, Hoboken, N. J. Mfd. by THE J. G. CHERRY CO. OF CEDAR RAPIDS, IOWA.

JANSSEN DAIRY CO., INC.

WHERE THE SEARCH FOR DURABILITY ENDED WITH NICKEL

WITHOUT prejudice or favoritism, the Janssen Dairy Co., Inc. chose Nickel dairy equipment because they knew there was a definite need for *durability* with cleanliness—for a material that would last long and at the same time safeguard the purity of the milk. This company says:

> "We have to operate our equipment 365 days in the year, and cannot afford to lose any time; therefore, we believe our search for durability is warranted, and for this reason we installed all nickel . . . . . .
>
> "In using it for buttermilk purpose, we had practically perfect results, giving it a thorough test by leaving the buttermilk, after it was completed, remain in the vat for 48 hours, it leaving no metallic flavor and did not discolor the vat."

If you have been seeking convincing evidence of the advantages of using pure, solid Nickel dairy equipment, here it is—in the Janssen Dairy Company's experience. Results here, as in hundreds of other dairies, prove that Pure Nickel lasts longer, that it won't rust, that it resists corrosion, that it is easily cleaned and that it will not contaminate the product. Can any dairy demand more of equipment materials?

Why not ask YOUR manufacturer about Pure Nickel equipment? Or if you choose, write direct to us for complete information about Pure Nickel.

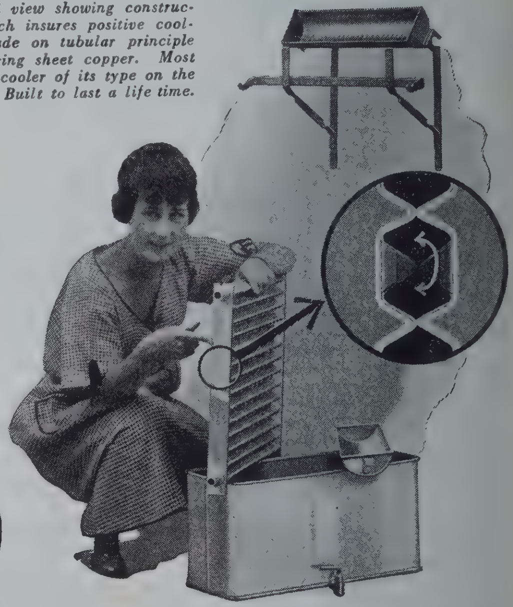
Purity Gregory Cooler

SINCE 1873, O & B Purity Milk Handling Machinery and Supplies have been made at Cattaraugus under most advantageous conditions. Our policy has always been "not how much but how well can we build." This policy has resulted in "Fifty Years of **Honest** Equipment," Honest Quality and Honest Prices.

The very atmosphere around the O & B factory at Cattaraugus breathes of sane prosperity, thrift and contentment. You will often find three generations of workmen toiling side by side. Low production costs and high quality are the natural results that you enjoy when you purchase anything in the O & B Purity Line.

We will be pleased to tell you more about O & B Honest Equipment. Write us.

Sectional view showing construction which insures positive cooling. Made on tubular principle of enduring sheet copper. Most efficient cooler of its type on the market. Built to last a life time.



Fifty Years of Honest Equipment

Creameries, cheese factories, ice cream plants and their farmer patrons, all need the Purity Gregory Cooler, attached to farm water systems. Guaranteed to withstand 25 lbs. of water pressure. Cools within one degree of cooling water. Circulation is absolutely positive. All water must circulate through entire cooler. Coldest water cools coldest milk.

View of Miller-Hydro at the Roseland Dairy, Chicago, Ill.

The Great Step Forward in Bottle Cleaning Methods

IN every large dairy the Miller Hydro will save several thousand dollars in salaries alone during the first year of its operation. It will completely eliminate bottle breakage and wastage even in handling an output of 2500 cases a day.

Figure what these savings will amount to in your own plant. Then consider along with the savings that over 3500 dairies, breweries and bottling plants of enormous capacity have pronounced the Miller Hydrostatic way of sterilizing bottles superior to any brush washing method that has ever been devised.

You can do away entirely with brush contamination, broken bottles and expensive replacements by installing a Miller Hydro. No other bottle washing machine made can equal its performance. It will pay for itself in your plant before you make the last payment.

Let us show you the many advantages of sanitation and economy that the Miller Hydro holds for you. Write today for complete information and list of large users.

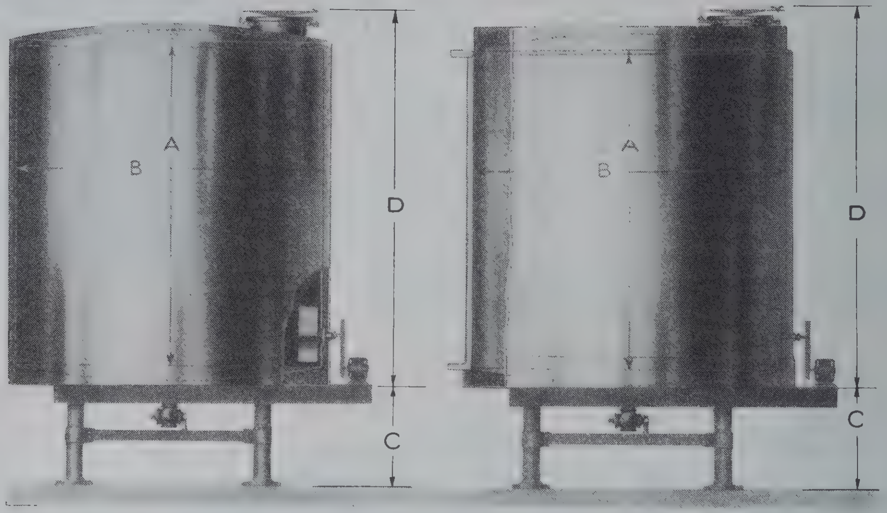
Nickel Storage Tanks of Ninety-nine per cent Pure Nickel



Seamless throughout, all joints in the sheets are cast together so that there is only one metal to come in contact with the milk. No soldered seams or riveted joints; dished heads and center outlets assure perfect drainage. Equipped with an impeller agitator made of nickel and running in a nickel bearing. Made in 500, 1000, 1500, 2000 and 3000 gallon sizes.

The tanks are insulated with 2-inch cork board and covered with a welded steel covering that seals the insulation from moisture.

The jacketed type is equipped with a spray system for brine cooling, encased with a Mond "70" shell running the length of the straight side;—heads are insulated with cork board as in the insulated type.

p Gets a New Slant on Motor Oiling

TRADITION
PROGRESS

Lad—

I find that the shutdown yesterday
s due to motor trouble. The foreman tells
that this new motor burned out a bearing
d it wasn't overloaded—it didn't get enough
. What are you trying to do—spare the oil
d spoil the motor?"

"No, Pop—

it's your friend the motor maker who is doing it. That trouble is due to that Scotch oil ring that your old crony puts in his motor —a piece of solid brass—just as they did in granny's day. I asked you to buy a Linc-Weld motor because one of twenty-one tradition shooters in that motor is this TROUGH RING. It carries ten times as much oil to the top of the shaft. It can NEVER skimp on oil."

Cherry Flush Valves

WORKING in cooperation with the UNITED STATES PUBLIC HEALTH SERVICE we have perfected an outlet "flush" valve which eliminates "dead ends". The CHERRY FLUSH VALVE absolutely assures the pasteurization of every drop of milk in the pasteurizer. An Automatic Drip Leak Escape allows any milk which may seep past the valve seat to drip away. An Auxiliary Valve prevents milk in the sanitary line from backing up into the valve outlet. An Automatic Steam Sterilization device makes it possible to completely sterilize the outlet chamber. And the bulb of a recording thermometer may be attached direct to the valve outlet chamber to record the sterilization of the drip, seepage and milk smears in the valve body.

The CHERRY FLUSH VALVE *has been approved by the* CHICAGO HEALTH DEPARTMENT.

AMF Automatic Milk Bottle Sealing Machine with Milwaukee Filler

The *Sanative* Seal

THE Westlake Sanative Seal for milk bottles is a one-piece, non-resealable cover made of five-ply spruce paper. It affords the most perfect protection ever designed for the contents of the bottle, and it is applied more easily than any device for the purpose now made.

This seal cannot be knocked off in handling or jarred loose, but may be removed easily by hand with a combined turning and lifting motion. When in place it completely protects the milk against contamination from unclean hands, dirty ice or animals. When once removed, it may be replaced loosely as a dust cover, but cannot be retightened and used as a seal again.

The AMF Automatic Milk Bottle Sealing Machine softens the disks, moulds them, and sets them in place on the bottle. No wires or other equipment of any kind are required to keep this one-piece Sanative seal tightly in place on the bottle.

Write today for complete descriptive literature and prices.

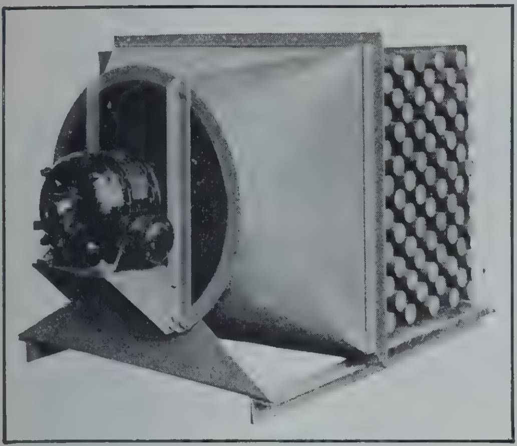
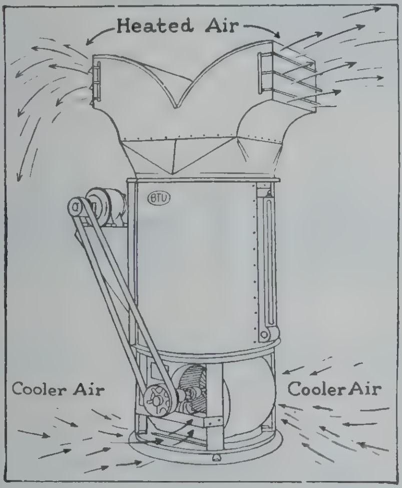
Everything for the Dairy Industry



The Chinook Unit Heater

The Chinook Heater and Ventilator—a recent addition to our line of heaters, has been designed to fill the demand for heating large single rooms by a compact unit. It can be suspended from the ceiling. This popular priced heater is built in three sizes.



The B. T. U. Heater

Diagram shows how air is circulated and warmed. The Bayley is built in 6 sizes—a range suitable for most heating needs.

Get Rid of Fog, Steam, Dampness—Give Your Plant a Dry, Healthy Atmosphere With These Low-Priced, More Efficient Unit Heaters.

NOW—at very reasonable cost—you can quickly and easily install these compact, highly efficient, heating and ventilating units in your plant.

It will pay you in the form of increased production, healthier, better satisfied employees, to provide for them a clean, fresh, dry atmosphere in which to work. Visiting patrons too, will get a much better impression of your efficiency and your product.

You simply can't select more dependable, more easily installed, practical units than the Chinook or the B.T.U.—heaters that will perform and serve you so efficiently day after day for years. No matter what heating and ventilating problems exist in dairies, ice cream and industrial plants, we're equipped to handle them in the most practical, economical way.

A special folder giving descriptions of heating and ventilating equipment is yours for the asking. Send for it today.

Steady, Dependable Cooling!

That's the kind Lipman Machines give! No time out for repairs that hold up the whole works and cut down profits by increasing running costs!

Only high grade materials are used. Only experienced, skilled labor is employed. And only after the longest, most severe testing-out and the most careful, painstaking inspection are Lipman Full-Automatics sent out into the world.

No wonder they hold up and give steady service! Dependability is built right into them and has to come out in performance.

You really should post yourself on Lipman Refrigeration. All of the larger cities and many of the smaller ones have Lipman Sales and Service Stations. Ask one for a Free Demonstration. And write us to send you our Descriptive Literature giving the facts.

OFFICIAL ORGAN OF
The International Association of Milk Dealers
Dairy Products Association of Kentucky, Inc.

JANUARY, 1927

BULLETIN *of* EVENTS

Michigan Allied Dairy Association—Annual convention and exposition to be held at Jackson on February 7 to 11, 1927. Exhibit will be staged at Fair Grounds, five blocks from Hotel Hayes, which will be convention headquarters. Secretary, D. W. Shiel, Hillsdale, Mich.

Dairy Products Association of Kentucky—Final meeting of the spring and summer season will be held in Cincinnati, O., on Wednesday, April 21, at the Gibson Hotel. Carlton Ball, 206 Republic Bldg., Louisville, is general secretary.

DO YOU dominate your business organization to the extent that you kill initiative in your employees? If so, you probably have some high priced men around you that are poor investments. They can't "deliver" for you if you don't give them a chance to use the brain power that you are paying for. What sense is there in paying an executive's salary to a man and then making an office boy of him? Perhaps it would be a splendid idea to take an inventory, first of yourself and then of your organization.

* * *

A MILWAUKEE housewife recently brought suit against a local milk company for $3,000 damages, claiming that she cut her hand opening a milk bottle. If she collects damages we are going to sue the company that made our automobile. He put windows in the car and the draught gave us a bad cold.

* * *

OUR front cover this month shows how a Dayton, O., dairy company has rigged up a traveling advertisement for milk. This interesting part of an outdoor advertising campaign was photographed by the Gilliams Service Company of New York.

IF WE are to give credence to the opinions expre by some of our leading citizens we must believe we are just nicely started on a wonderful year for ness. Prosperity is to continue and the great majo of our people will have lots of money to spend.

Men in the milk industry will profit in the propor that men in other legitimate lines prosper. True, are dealing in products that are classed as necessities buyers use them more freely when their buying po is increased. The first bottle of milk per day ma classed as a necessity, but the second a luxury if family income is lessened.

How to get the family purchasing agent to look the second or third bottle per day as a necessity is a problem yet to be solved by the men in this industr

The best time to educate the consumer to use milk and milk products is when that consumer has money to pay for them. That is the time to get hi her to form the use-more-milk habit.

Let's make 1927 a red letter year in the histor the bottled milk industry by pushing hard all the gressive things that have been adopted for the guid of the industry. As each man helps to build a b industry he will build a better business for himsel

* * *

YOU like to do business with people you like, you? You may be one of those who think that s ment has no place in business, but you must admit everything else being anywhere near equal, you are ing to trade with the fellow who makes you feel tha is your friend and that you are his friend.

You unconsciously, perhaps, find yourself doing ness whenever possible with him. Other men ma nearer, but life is too short to waste time around who cannot make you glad to see them. Is all of this That's asking too much of us. It doesn't seem fa bit, especially if you are a hard-working cuss tryin split hairs to do the right thing. But we cannot be responsible for natural laws. Men can make laws change them when they get tired of them, but in co into this world we find laws of nature that canno budged. Instead of grumbling with them and tryin change them, it is much easier to change our viewpo

Two men can work side by side every day in week, and if they come in contact with the outside you will see that the man who can smile and be a able will go up much faster than his companion who be ever so much more capable but very deficien humoring folks who cannot see things his way. condition can be cussed and called unfair until you hoarse, but that doesn't change human nature.

Personality counts. Mark that down heavily on day-by-day calendar. You may not know near much about your business as the fellow down at bend of the road, but if you can put your heart in few winning smiles when folks come around yo won't be but a very little while before folks will beg say you are one of the brightest men in the dairy ness. Human beings are just built that way. That'

I CAN'T keep up my volume without taking heavy losses on collections." Thus remarked a certain il dealer while we were talking about collection meths retail and wholesale. He is sincere in his be too.

n other words this man admits that he must give part of his goods in order to maintain a certain ne of business. He is not the only milk man who that way. He has lots of company.

ther men in the milk business will agree with us it isn't necessary to give away milk in order to get ness or hold it. They will agree that all free milk old be accepted as such by the recipient, not by let him get it free by not paying what he owes.

he writer of these lines was for several years con ed with a big creamery concern operating branches any large cities. All butter was sold through the il stores. The collection problem was a serious one. branch manager was more successful than all the in collecting accounts. One year he didn't lose a in doing many thousands of dollars worth of busi Another year he lost but one account, less than His increase in sales from year to year compared favorably with all the rest, ahead of most of them.

he other branch managers couldn't understand how id it, but to him it was no problem at all. When ed for a statement, he said: "My dealers don't that they can buy butter without paying for it. understand that butter is cash and when I extend t to a certain day they must pay on that day. That there is to it."

imple, isn't it? That man collected his accounts held his business. Don't conclude he had easy com tion because he didn't. He had plenty of careless etition, but he gained the confidence and respect e business men in his city by requiring them to pay his money when it became due—not the next day. ained them.

he milk business, either retail or wholesale, can be led in the same way. It is up to the man at the . He can train his customers to pay him the money is due him or he can train them to beat him out of of it.

⚜

HERE is no line of business where outside appear nces count for more than in the milk business, and is connection the appearance of the inside of the comes under the head of "outside appearances." t is the impression that people from the outside get ur plant, both within and without, that counts. If is any place in your plant that needs painting, can't economize by putting off the expense. If wagons or trucks need going over, nothing is to ined by waiting. If your windows need washing, you never should wait for that to happen. Cleanli not only is next to Godliness, but is mighty good ess, especially in the milk business.

SEVERAL weeks ago a friend, who has made a close study of the milk bottling industry for years, made the statement in our hearing that "most milk men are progressive in their plant methods but are woefully weak in their sales methods."

He went on to say that the most of them are satisfied with antiquated methods of selling their products because their business is increasing from year to year. He claimed that their volume of business has increased not because of their selling methods, but in spite of them.

Ever since that interview we have been unable to dismiss it from our mind for very long at a time. We are still wondering just how nearly true is that man's appraisal of the selling methods of "a great majority of our milk dealers."

We all know that the consumption of bottled milk has greatly increased from year to year. What is the reason for it? Is it due to the selling efforts of our milk dealers or is it due to other agencies that have promoted health programs in schools, clubs, etc.? Find the answer to these questions and you will know how much importance to attach to our friend's remarks.

He claims that it is hard for a business man to see that his selling methods are weak so long as his business is growing. He claims that influences other than the selling efforts of our milk dealers are largely responsible for the increased use of bottled milk.

If our friend is right, and we are inclined to believe that he is at least half right, we look upon the situation as highly encouraging. It means that the milk dealer who employs real selling methods is going to win a still bigger increase in business. He will still enjoy the aid of these outside influences that are boosting his business all the time.

But if our friend is only half right it is high time for the men in this business to make a thorough analysis of their selling methods. Don't be content with your way of selling milk just because your business is growing. Perhaps your volume can be increased 20 per cent this year, instead of 10. Why not check up anyway and see if you are doing all you might to earn the increase that is possible? It's worth thinking about, anyway.

⚜

BUY that machine. You have been putting it off long enough. It may be a pasteurizer, homogenizer, bottle washer, but whatever it is you need buy it—by all means buy it. One of the greatest mistakes we make, and one of the most common mistakes, is that of putting off doing something that is going to cost a little money. When we better prepare ourselves to handle business we extend an invitation to new business and it will certainly come. Business begets business. This does not mean that we should spend out of proportion to what the business volume justifies, but that we should have what we need in order to do the business right.

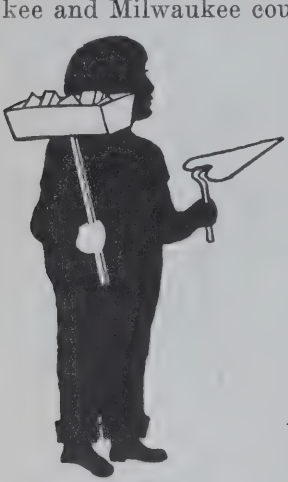
⚜

SHORTAGE of milk and cream supplies in some sections is making itself felt and many in the business believe it will be felt even more keenly before grass time comes again.

More Milk for Everybody

Health Workers Connected with the United States Department of Agriculture and the University of Wisconsin Stress the Food Value of Milk and Milk Products in Intensive Campaign

ABOUT four years ago the University of Wisconsin, co-operating with the United States Department of Agriculture, sent representatives into Milwaukee and Milwaukee county where a definite program on milk and its value as food was put on during one week. This program was planned to reach the school children primarily and, through them, the homes. In addition to reaching the schools, a speaker was sent to each organized club such as the Rotary clubs, the Kiwanis clubs, the Lions clubs, women's clubs, Parent-Teachers' associations, etc. Very many of the schools trained pupils to give milk plays, to recite poems and sing songs about milk and milk products. The burden of all this program was to urge people to use sufficient milk. The results of this work four years ago was an increase in the sales of milk through Milwaukee and Milwaukee county, a very satisfactory increase in the use of milk in the schools and a decided improvement in the health of the school children.



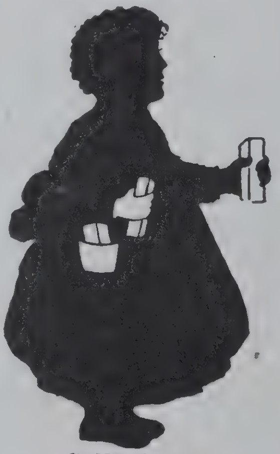
Minnie Minerals

In carrying on this work the officials made good use of a four-page circular entitled "Wisconsin Milk Fairies." We quote from it as follows:

"Do you know that in every glass of milk, bottle of milk, or pan of milk there are five good faries who help boys and girls to become healthy men and women? Let us look at the pictures of these fairies and find out what they do for us.

"Here is the first fairy and her name is Minnie Minerals. What do you see in her hand?

"Yes, it is a trowel.



Sally Sugar

"Minnie Minerals is a builder fairy and uses that trowel in building the frame work of our body house. Our body houses are just like the houses in which we live. Wooden houses must have straight solid framework or they will tumble down. A wooden house can be rebuilt if it wears out. Can your body be built over again? No, we can only build one body house, so that house needs to have the best framework and the very best materials put into it.

I BUILD M SCLE
Polly Protein

"What is the framework or hard part of our body called? Bones. And the hard part in our mouth are called what? Teeth. Minnie Minerals builds our teeth and bones and without her help we would all be ro around like balls of putty without any shape.

"If we had only our bones and teeth, we woul queer looking people. But our second fairy is an builder who builds a covering for our framework. Here she is and her name is Polly Protein. What is the covering of our bones called? Flesh and muscle. The boys particularly will want Polly for a friend as they like to have good solid muscle so they may be good football or baseball players.

Fanny Fat

"Now we have our framework, our teeth and bones built by Minnie Minerals, and our muscles built by Polly Protein. What do you think our third fairy will do for us?

"She is just as sweet as she looks and her name is also sweet—Sally Sugar. Before I tell you what she does, I want you to know her mate, Fanny Fat. They play together as some of you children do, and do the things for you.

"Why do you put wood in a sto coal in a furnace? To give heat and the house warm. Our bodies are jus stoves or furnaces and must have co wood to keep our body house warm.

"Why does anyone put gasoline automobile? To make it go. We must something in our body engine to make Sally Sugar and Fanny Fat are our fairies. They do for our body house the coal and wood does for the stov furnace and what the gasoline does fo automobile. They keep our body house and they make our engine go. We now the framework and covering for our house and fuel to heat the house and e to make it go.

"We still have another fairy to do something for us. She has the hardest of all names, Viola Vitamines. Without her you would never be any taller than you are now and would be ill a great deal of the time. She makes you grow and keeps you well. She and Fanny Fat are different from some of the other fairies for if you let a pan of milk, or a pail of milk, or a bottle of milk stand still for a little while, Viola and Fanny wiggle and twist just like some of you boys and girls until they are on the top of the milk. They stay there until you stir the milk up again. They live then in what part of the milk? The

Viola Vitami

n. They have a special message for you children in they want you to drink whole milk or milk with a cream in it so that you will surely have some of in your milk for Viola is the fairy that helps you to and to keep you well.

These are the five good fairies in milk, and they every day for boys and girls who drink plenty of Some of the foods we eat have one of these fairies, have two, some three, a few four, but no other food ll these five good fairies. Milk has Minnie Minerals ild teeth and bones; Polly Protein to build muscles; Sugar and Fanny Fat to give you heat and energy; Viola Vitamines to help you grow and keep well.

But how much milk will you children have to drink at the fairies can do all these good things for you? pful with every meal and the fourth cup in the food eat is a good rule for every boy and girl that they have good strong bones, firm muscles, plenty of gy to work and play and may have help to grow big, strong, healthy people.

At least three cups of milk every day and four if ble is a good rule."

Because of the results shown during these last four years, Miss Mary Brady, the nutrition specialist in Milwaukee county, assisted by Miss Gladys Stillman, the milk specialist of the home economics extension department of the university, will sometime in February put on a follow-up program in Milwaukee, which they hope will be quite as successful in urging greater use of milk and milk products as was the one put on four years ago. Since the lower grades of school have an entirely new group of pupils, there will be children who have never heard the milk stories. These children will be reached and taught milk songs, as well as helped to learn various milk stories and put on milk plays.

Since Wisconsin produces so much good milk and since Milwaukee sells milk cheaper than does any other large city in the Union, it is a duty as well as a privilege for Wisconsin people to see that every child has sufficient milk to give it not only a good body, but resistance to disease and the ability to work, which always comes from the best kind of food. "Use enough milk for health" will be the Wisconsin motto.

---

dvertising Milk to Five Million American Families

Sunday Papers With Nation-Wide Distribution Carrying Messages of the Purity of Milk and Boosting Entire Industry

OMETHING quite unique in the annals and history of the fluid milk industry is being done by one of the dairy supply manufacturers. This something broadcast the story of the care with which milk is aced and handled, telling the up-to-date, cautious costly processes through which it passes and praishe milk dealer, building good will for him, through ies of full page colored advertisements appearing in American Weekly, the magazine section of the st Sunday papers, which has a circulation of over aillion and which reaches cities from coast to coast, north to south.

resident Coolidge in his speech of October 27 before merican Association of Advertising Agencies stated advertising is the primary factor in American ess growth and is a great educational force. Adsing builds not only sales but good will and good s just another name for confidence. This manufac is paying for this large and forceful advertising aign to help milk distributors sell their better es of milk by establishing confidence in the minds e consumer, believing that in doing so they are helphe whole industry to raise the standard of its merdise which will keep pace with the evident desire e American public to improve its standard of living. nd, while the company is assisting in the sale of own product naturally enough, they are at the same and ungrudgingly, building good will for every dealer who practices approved and sanitary ods.

his publicity campaign will increase the good feeloward milkmen the nation over. It will make ers feel safer about the milk they give their babies. the consumption of milk greater, and enhance the lence which all the milk-consuming public has in erfect food product.

Telling of the "Millions Spent by Dairies."

ne of these advertisements, which appeared in a November issue of these newspapers, carried the heading: "Millions Spent by Dairies to Give Your Children Clean Milk." It pictured a herd of dairy cows grazing contentedly in a wooded pasture, an enchanting stream running through it and a background of pure blue. It pictured a modern dairy barn, inside view, with its steel stanchions, a row of well-groomed dairy matrons and a man milking in a clean, white uniform, including the approved dairy cap. It pictured pasteurizing equipment, within a milk plant, and showed the bottle washing and the filling and capping machines. And it pictured, too, a mother holding a wee baby in her lap, feeding it a bottle of milk. Her facial expression is calm, confident.

Another advertisement, which followed the one just described, tells of the "tremendous efforts these progressive dairies have made to insure you clean milk." It carries illustrations of several of the largest and finest dairies in America.

And here again, we may gain a better idea of the remarkable size of the dairy industry, as it relates to the fluid milk industry. The company carrying the advertising and spending this large sum of money manufactures a milk bottle seal, a product which is not expensive yet which because of the greatness of the fluid milk industry, it is able to advertise in this big way. It is also, in no small way, indicative of the value of advertising, showing the results which can be secured by advertising the truth about milk to the consumer.

Is it not abundantly true that the public does not appreciate, except in a most small manner and in a very tiny degree, the lengths, the expense to which milk dealers and producers of milk go to provide a clean and safe product? And this advertising is telling the story of clean milk and safe milk. It brings direct, profitable results to the company paying for the advertising space, to be sure. But it is valuable to every dairy in America for it is spreading the gospel of milk, telling of its purity and its safeness. The entire industry will benefit by this intelligent advertising campaign being waged directly to the consumer of milk.

Some New Ideas on GARAGE EQUIPMEN

When to Install a Maintenance and Repair Department and When Not to

By PHILIP L. SNIFFEN, *Motor Truck Advisory Engineer*

ARE you doing your own delivery truck repair work, or are you having an outside service station do it for you? Which **should** you do? Which is cheaper?

A great many city milk dealers have asked me this question, and I believe that it is one of the most important questions a user of delivery vehicles in this business has to answer. Several things enter into it besides the cost of one versus the other. The life of the vehicles, the idle equipment time, and the dependability of the service depends a good deal on what service policy is used.

I believe that the milk dealer who is having his repair work done outside because his fleet is of small size or because he has found it hard to get the right kind of help is often justified in doing so. But I believe that same fellow is going to get a terrific licking in the ultimate expense unless he sticks to some real policy of adjustments and lubrication during the in-between times when his trucks are not in the shop. It is the tendency of most concerns who do not have their own shops to do this, and it is a disastrous one.

Avoid Common Mistakes.

A great many milk dealers who operate small fleets of trucks are not doing their own repair work. They take care of minor adjustments and lubrication themselves, but whenever anything serious occurs, the truck is sent to a public garage or to the truck dealer's service station. A glance at the cost records of these concerns shows that this is often satisfactory, but that it is decidedly an unprofitable policy in cases where nothing is available in their own system to take care of the trucks from day to day. And these cases are surprisingly numerous. It is only necessary to examine the policies used by the large department stores, laundries and other concerns who operate large fleets of trucks to understand the importance of this. The trucks owned by these companies are always clean in appearance, thoroughly lubricated, and given a systematic inspection. The reason for this is that these companies have found from experience that any neglect in properly maintaining the vehicles runs up into enormous sums. The man who operates a smaller fleet of trucks is no different from the department store that runs a large fleet. The principle is

the same, even though the numerical side of it is differ

The business man who has five or ten trucks can
tually save money by maintaining them himself,
vided he uses the right shop equipment, and establi
the same good systems for his shop that he has in
rest of his business. He must give sufficient though
this and study the problems of garage lay-out, tool eq
ment, and shop records. If the plan is started in a s
way, he will gain experience as he goes along wit
causing so much time and thought as to disrupt the
of his business.

Accompanying this article there are a number of
gestions on garage and shop layouts that have wo
out successfully for concerns using a varied numbe
trucks. They will give the truck user, regardles
the size of his fleet, suggestions on how his own
ditions can be met.

An Interesting Survey.

A short time ago, a survey was conducted among
cerns in various lines of business to determine the
cies which are now most popular in maintaining t
equipment. This survey tabulated replies from 407
cerns, and the replies came from companies using
where from five to thirty-six and more vehicles.
purpose of the survey was to find out how many
shop equipment and how many do not have it. It
found that 84 per cent of the total are now maintai
their trucks by shop equipment of their own. The
plies were grouped according to sizes of fleets, and
following summary will be interesting to those who
trying to decide whether or not to install their own s

Size of Fleet	Have Own Equipment	Do Not Have Equipment
5-10	127	54
11-15	104	13
16-20	49	4
21-25	27	1
26-35	38	2
36 or more	62	2
Total	407	76

Another investiga
which reached 427 ow
also operating various
fleets and in different lin
business, showed the
lowing:

91 had invested up to
78 had invested $ 500 to
101 had invested 1000 to
52 had invested 2000 to
45 had invested 3000 to
60 had invested over

was found in this particular investigation that it mpossible to say that the amount invested depended the number of trucks used, because it was found in some cases a larger investment was made for er fleets than for fleets of considerably greater size. rally, it is impossible to set down any kind of figure would be accepted as a standard amount for a size of fleet, because individual conditions will greatly, but the above table will help to show the nts which many concerns consider it advisable to nto repair shop equipment.

Ideal Shop Equipment.

he best advice that can be given to a concern that tains its own vehicles is that the owner, or whoever ponsible for the garage, should be open-minded on bject of shop tools. He should be perfectly willing nsider the suggestions of his shop superintendent or mechanic. Modern shop equipment has been so tifically constructed that it actually saves anywhere 20 to 50 per cent of the mechanic's time. Competi- among manufacturers of shop equipment has ght the most modern devices within the reach of all users, so that there is no excuse for poor or inade- tools to work with.

he writer's experience has been that truck users, equipping a shop, buy their equipment too hap- azrdly. The result is that the most essential things eft out and many unnecessary things installed. For reason, the following outline is suggested. It is in- ned to list the more important units of shop equip- as they have been found to be most helpful in the l experience of truck users within the writer's ob- ition.

ngine Stand: This eliminates waste motion in per- ng mechanics to work from all angles. One me- ic can work on an engine without requiring an- 's assistance for lifting or turning over.

athe: For all all-utility work. Rigidity is impor- and lathe must have correct "swing" to be suc- ul.

acks: One or more necessary for quick moving of les to working position. Also used for raising rear of truck for inspections and adjustments.

ervice Rails, or Racks: Used in preference to the ." Permits access to all parts under chassis. Better and more working space.

lectric Drill: Replaces many old-fashioned hand . Allows quicker work. Adaptable to limitless jobs. Comes in large and small sizes. Most shops require both sizes.

Axle Stands: For repair work on rear axles this is essential. Should be portable and adjustable as to height.

Tire Changing Equipment: Many designs are available, most of which are practical. Permits quick removal of rims, and saves more than half the time of hand-changing.

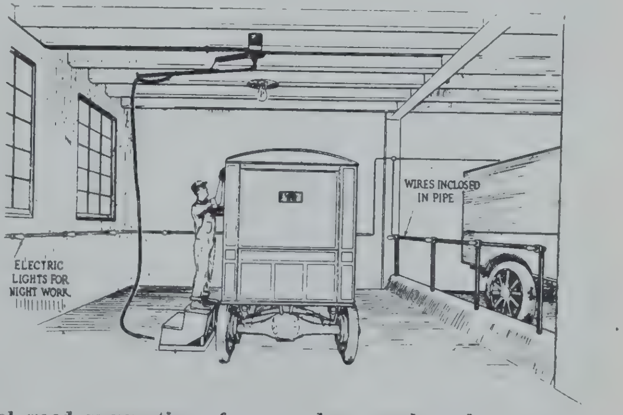
Power Drill Press: An adjunct to the lathe. Soon earns its cost in permitting mechanics to make parts and prevents tying up job when necessary part is not available. Most shops require a drill press of sufficient size to drill holes up to ½ or ¾ of an inch.

Brake Re-lining: Many concerns find they can save several hours time on a re-lining job of either brake bands or clutch facing with this device.

Wheel Aligner: Frequent inspections should be made of wheel alignment and this device enables this to be made very quickly.

Portable Work Bench: Time is saved, providing one of these, each complete with tools and working apparatus is furnished for each mechanic. Tools can be brought alongside the job, saving considerable time.

Grinder: Can be mounted on bench or used with floor stand. Essential in many small operations. Sharpens drills, cuts tools, and provides means for finishing rough work.



WIRES INCLOSED IN PIPE
ELECTRIC LIGHTS FOR NIGHT WORK

Several good suggestions for a modern wash rack are shown in this sketch. Note swinging arm for hose above truck.

Press: Helps on many miscellaneous jobs and has numerous time and labor saving attachments. Helps to remove and replace bushings, gears and in removing frozen parts.

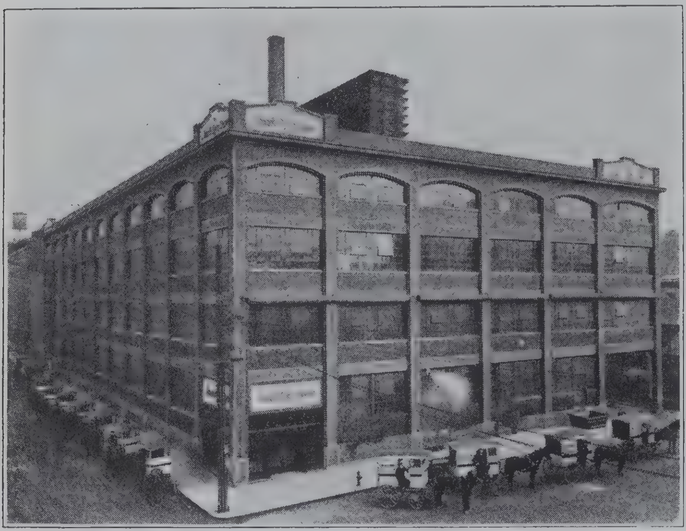
Achievement in Dairy Service

What a Cincinnati Dairy Plant Has Accomplished in Building a Business and Serving the Public. French Bros.-Bauer Company Founded in 1842

CITIES rise and fall as the energies of their people wax or wane. Hamlets established in the wilderness of yesterday are today proud municipalities. Energetic pioneers hewed them from the forests, protected them from savage men and beasts by force of arms, and established them in main arteries of commerce by force of brains. All by energy or ambition—and ambition is the quintessence of energy. Whence came this energy of the past? Is it in evidence today? And what about tomorrow?



Main Plant of the French Bros.-Bauer Co., Cincinnati, O.

Consider Cincinnati. The yesterday of the 1800 saw her as a frontier trading post. Today called the "Queen City" by her proud residents wherever they travel—on tomorrow, a generation or a century away, she must either be a greater, better city, or something infinitely worse than today. Nothing stands still—it either improves or deteriorates. Which way shall Cincinnati grow? And where is to be found the source of that energy of yesterday's pioneers and given to the builders of today and tomorrow?

Ask us to name the source of greatest energy, the greatest stimulant to growth of children, the greatest source of nutriment for adults, and the greatest insurance for a ripe old age, and we must reply by showing you a peaceful farm yard, with a splendid herd of cattle—dairy cows—Foster Mothers of a city.

Examine the life stories of America's greatest heroes, of her soldiers and statesmen, of her leaders in business, in professions, and in the arts. Energetic men all—born of energetic, ambitious parents, and—significant to the discerning eye—it is found that they all drew sustenance very largely all of their lives from these "Foster Mothers" of energetic people.

Show us a municipality which has already provided for maintenance of its people's energies by establishing close communications with their Foster Mothers of the rural country, and we prophesy that city shall grow and grow greater. Show us a city with a pure milk system that stands always as one of the country's leaders, and we will prophesy that the city shall continue a leader of the United States.

Eighty years ago the historic company of French
Bros.-Bauer was founded by Thomas French. He g
Cincinnati an organized dairy company only one
after the first thing of its kind in America was organ
in New York City. From this pioneer company g
Thomas French's Sons, Inc., which in turn became
firm of French Brothers shortly after the Civil War.

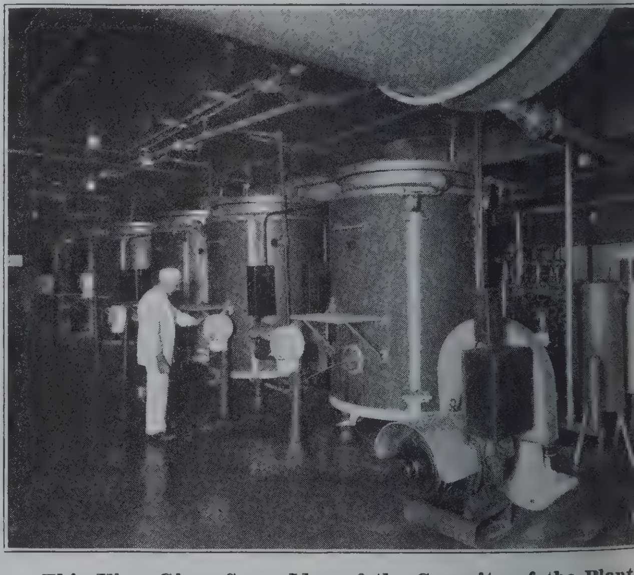
Far-sighted policies in providing for the city's
supply have always characterized the firm of Fr
Brothers, and its successor, The French Bros.-Bauer C
pany. Whenever the advance of science taught
ways to safeguard community health as affected by
supply, the company has always been found in the
of the country's progressive dairymen.

While other organizations have built the city f
brick, stone and concrete, trained the minds and i
enced the character of its people, French-Bauer has
haps done more than any other one organization to b
the energy of these people.

This energy has been made available to four gen
tions. "Service" has always been their slogan an
in the spirit of the word "Achievements in Dairy
vice" goes on in the French Bros.-Bauer Company.

There was a time when the outskirts of Cincin
pastured enough cows to provide the city's milk su
close at hand. In those days Thomas French and
sons had their various dairies successively in what
today the centers of Hyde Park, Oakley, Clifton, O.,
Newport, Ky. But as the frontier trading post expan
from the simple town of 1840 to the city of today,
growth of the city itself forced the dairy supply
farther and farther back into the surrounding rural
tricts.

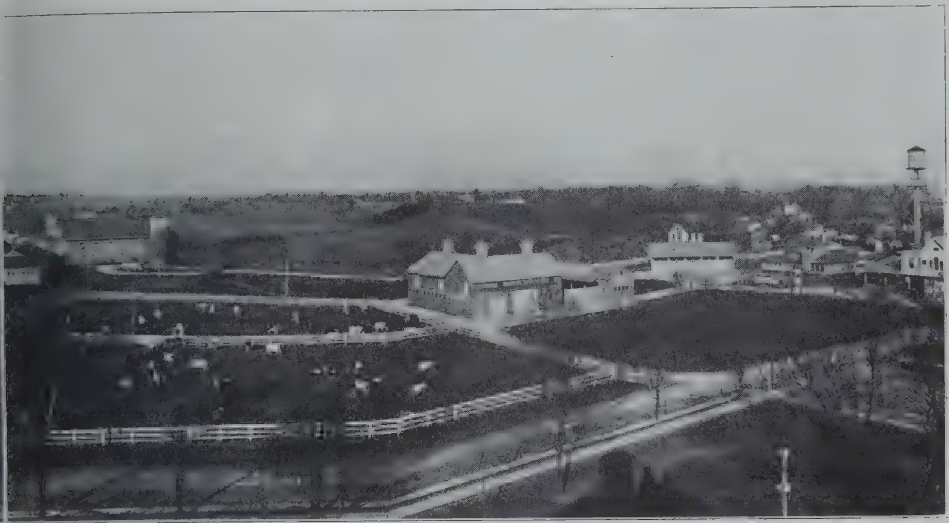
Growth of scattered groups of homes on the
munity outskirts into populous suburbs of the city
a double effect: First, the dairies themselves
crowded back to make room for city homes; and
the speculative value of the land they occupied in t
second positions became so high in anticipation of
further city growth they were forced to retire m
deeper into the country. And so the "Foster Mothe
of the city, once close to the people they served, bec



This View Gives Some Idea of the Capacity of the Plant ed from them by many miles and scattered over a ory within a radius of about 50 miles.

ransportation facilities became the big problem of ilk supply business years ago. It was a problem ving the collection from widely scattered farms and ringing into the city of vast volumes of pure, fresh and distributing it quickly.

orse and wagon milk collection methods of early necessitated the building of scores of country reng plants. At these plants the milk was refriger- to fit it for its long, slow journey to the city by gons, by slow trains, or by uncertain trolley roads.



At the Certified Milk Farm.

ecame the boon of the gasoline motors, and the swift t of trucks quickly swept scores of country plants oblivion leaving in existence today less than a dozen k points for milk collection.

ast capital expenditures for the benefit of the city's k supply have constantly been forced by the city's wth. In addition to the changes in the transporta- n and milk collection systems, a succession of expen- e city distributing plants has been forced upon the ench Bros.-Bauer Company in its race to lead in scien- c achievements and give cinnati the best health in- ance of the times.

Advancement in knowledge community health necessi- s by physicians and scien- s ed to a succession of ar of health regulations, st of which were antici- ted by years through the sightedness of the company cials.

The old tin pail delivery stem called the ''dip and ry'' gave way to the bot- d milk system in 1890. Cer- ed and inspected milk were roduced by the company rly in the present century. nd then French Brothers in- oduced the greatest health surance method of today— steurization.

In the old days of rural np city milk sold in the en in bucket for five cents quart. Innumerable city people still think back to those days and visualize the present milk industry as it was then. They cannot realize the vast increase in expense forced upon the dairymen by modern city conditions. And so they fail to understand that the modest profit possible in the old days when milk sold at five cents per quart has been cut and recut, until today, with milk selling at the present price, a small decimal of a cent profit is possible only to companies selling hugh volumes of milk.

Failure to properly visualize the enormous expense of milk gathering and city distribution under modern conditions is not a peculiarity of the average city dweller alone. Many city distributors who based their expectations of profits on false premises have been forced out of business in the last ten years by inability to raise capital to meet health requirement demands. A decade ago 400 dairymen furnished the city's milk. Today hardly 40 have survived.

But those who today constitute the city's pure milk supply system have achieved a triumph which is fairly comparable with the government's parcel post and rural free delivery of mail combined.

Cincinnati residents may well take pride in these achievements of their historic dairy company. Their business patronage of four generations has made such deeds possible, and all these works are but instruments for their service, present and future.

Achievement of Cincinnati's pure milk supply is not to be credited solely to the city distributors. Without the co-operation of their faithful, intelligent rural dairymen—the men behind the cows—no such accomplishments would have been possible. But the majority has always been willing to progress with the times and adopt the changes in methods and equipment that modern

(Continued on page 102)

Where Sanitary Methods Prevail.

Prevent Lead Poisoning With Milk

Prominent Authority Advises Milk Men of the Country to Further Investigate the Possibilities for Increasing Consumption of Milk by Factory Workers

By DR. CAREY P. McCORD*

MY FRIENDS, downstairs in this hotel right out there by the elevator entrance are four signs or notices. One high up refers to some fireworks company; one on the left and one on the right also refers to fireworks companies and then down at the lower end of that diamond there is a reference to the National Dairy Council. I wondered about the appropriateness of this classification but having been at the meeting this morning, having seen the dynamic qualities, the up and coming qualities of this organization, I know just exactly why the hotel brought about that classification.

DR. CAREY P. McCORD.

I want to talk to you, if it please you, for a little bit about foods and the industrial worker. Every morning out at my house I see, or perhaps I should say I hear a milk wagon drive up to my back door and leave an adequate supply of milk for my family, and I know that that sort of thing goes on at the back doors of all my neighbors. You have done a very good job in that situation.

Later in the day this same milk wagon or another wagon drives up to the schoolhouse in my community and leaves a supply of milk for selected groups of students there for mid-morning or mid-afternoon drinking, and I know that that is done in many hundreds and many thousands of schools and feel that you have done a very good job there.

I do not, however, know or see this milk wagon or any other milk wagon drive up to the receiving department of factories, of industries, and leave there an adequate supply of milk for the workers for their mid-morning or mid-afternoon and in many cases not for their noon consumption. This is true notwithstanding the fact that it is well known that nutritional problems are very prevalent in industry, notwithstanding the fact that within recent years death rates are very much higher among industrial workers than for such a group as this in preferred occupations, and notwithstanding the fact that we know that even as much as 10 or 15 years ago certain federal bureaus recommended that milk be used in industry to combat certain specific diseases.

We have in this country about 41 million wage earners. That figure, of course, takes in more occupations than factory work—mercantile work where people are in groups. Farmers would be included in such a group as that and other occupations where people assemble in any large numbers. However, something like 27½ million people go about their daily work in fairly large groups and accessible for whatever measures might be out in their behalf.

We ordinarily think of the people that make large group, the American workman, as being sturdy, well muscled, ruddy type of person—yo the kind that they put on posters when they wa scribe industry. To the contrary, as an actu least in my experience in the middle west, the i worker is not of that type. Many times he is a physical specimen, a poor human machine, illy to his work, and unless a person is skilled in som when a worker gets to be 45 years or thereabouts wants him except for the lowest type of work, an experience a number of factories give orders, " nobody here for work in this factory who has p years of age."

In any group at all, a group of factory worke out physical examination being made of them, pick out nutritional disturbances. Sometimes e partments in factories show almost in entiret tional disturbances embracing everyone there, bu group you can pick out here and there persons s from nutritional conditions; undereating, over- bad feeding, etc.

I want to give you just one example of the see fairly frequently. I don't know that this sh put forth as anything like average. I know that average, in fact, but I want you to get an idea bad conditions may be, at least at times.

I have in mind a work room about the size room in which there are employed about 20 These workers are mostly Kentucky hill men. T involves the handling of molten metal, galvanizin On one side of the room, were we there, we'd containing acid and from these vats steam arisin here would be, perhaps, a row of vats containing metal and from the molten metal fumes coming

Go into the room. You see a group of workm hardly look as though they were able to work Most of them definitely are underweight, most show signs of fatigue. If you get close enough you see their mouth conditions are almost unsp and all have the general appearance of being s sons.

If you inquire as to what has happened there, ber of things are involved and right at the outse say by no means is it strictly a nutritional prob the acid rises up in this steam from those va know acid ordinarily does not evaporate but whe arises it will carry some acid—these persons ar their whole bodies are bathed in an atmosphere The skin is not very much harmed but their t eroded, gums inflamed and they develop very ba conditions.

As a result, gastritis follows and in some cas follow. Exactly what produces ulcers we don but it may be the zinc. I have so described the At any rate, their entire food situation becon They find out that they cannot eat many foods of the acid condition but they find one or two fo they can eat and they live almost exclusively two or three things, most of which are bad.

* At the annual meeting of the National Dairy Council.

Salvaging Bottles in the Nation's Capital

More Than 20 Companies Operate Nonprofit Exchange—Labels Show Many Containers Travel Long Way—300,000 Sometimes Handled in One Week

NO, this does not refer to the sort of bottles that congressmen who vote dry and live wet are accused of "toting" around office building lobbies. story is about milk bottles and what the milk deal- re doing in Washington to keep down bottle costs.

)f course, a modern milk bottle exchange is the ver. A writer in the Christian Science Monitor tells story as follows:

'Looking at an ordinary, everyday milk bottle one ld hardly suppose that it could wander far from the in which its usefulness centered, and yet investiga- reveals that individual bottles take long trips. ndaries of states are no barrier to milk bottles, it ld seem, once they get the wanderlust, and instances ited of travel-stained milk bottles that have crossed inents and oceans.

F. L. Oyster, manager of the Washington Milk Bot- xchange, a co-operative nonprofit organization for vering milk bottles in behalf of the 20 or more milk panies of this city, has found bottles from as far as China in the course of collections made by the

The exchange conducts a business of no consider- magnitude, estimated to produce economies of $50,- a year alone in its work of salvaging milk bottles vn out on ash heaps, dumps and vacant lots, as well iose left in cellars and apartments by careless rs.

In addition to this it is a center to which the par- ating companies bring odd milk bottles which their ery men collect. The exchange sometimes handles any as 300,000 'strays' a week, Mr. Oyster reports.

Salvaging System.

Thirteen men are employed, and three trucks with s devote their whole time to collecting milk bottles have escaped domestic service and find themselves ng a careless life on ash heaps, in cellars, or the By returning such bottles into circulation the ex- ge, which was formed four years ago, is carrying valuable work of conservation, Mr. Oyster says.

the past, the competing companies found one of heaviest expenses the cost of replacing lost and ed bottles, which cost about 5 cents apiece. As a ete instance of how things have now improved, Mr. r said that at the present time in Washington we er 18,000 milk bottles a week alone from the two c dumps.

'The distance that some of these truant milk bot- s tray comes as a second surprise, after learning the proportions of the business. Baltimore is about iles from Washington, yet 800 or 900 bottles are back every week from Washington to the Balti- exchange, which has entered into commercial rela- with the local business.

'Washington uses about 350,000 bottles a day, Mr. r estimates. Assuming that the 20 co-operating nies keep three days' bottle supply on hand, it that well over 1,000,000 are in circulation. One company estimates loss and breakage at 20,000 daily. In the light of such figures the humble milk bottle emerges as an economic problem.

Travels of Milk Bottles.

"Mr. Oyster has bottles that have traveled all the way from Europe, China and South America. The mystery of these bottles will never be explained. Why anyone should carry a milk bottle from Hongkong to America is hard to understand!

"Mr. Oyster produced rarities that his men have recovered, plainly labeled in raised glass letters on the side:

"Quart bottle, marked 'City Creamery, 351 Dundas Street, London.'

"Two bottles, marked 'The Dairy Farm—I. & C. S. Co., Ltd., Hongkong.'

"Bottle, marked 'Un Litro' from 'S. A. La Vascongada, Buenos Aires.'

"Pint bottle, marked 'Vaqueria de Bartolme Alzamora, Miradero, Mayacuez, P. R. Licencia No. 1' (Porto Rico).

"Pint bottle, labeled 'El Indio, N. Pasarell & Co., Rio Piedras, P. R.' (Porto Rico).

"These bottles and others like them have been recovered casually from Washington consumers, or from the place where they were discarded.

"The operation of the Washington Milk Bottle Exchange is simple. For every stray bottle a member-company turns in, it is given a credit of one-half cent. The odd bottles are sorted daily. Each company sends in and takes away its own bottles. For each returned bottle a debit of one cent is entered. If surplus profits accumulate, the money is divided, with the exception of a few thousand dollars a year devoted to advertising, and a city-wide 'Milk Bottle Collection Campaign'."

CALIFORNIA OFFICIAL OBJECTS TO GELATINE IN BUTTERMILK.

Sacramento, Calif., Dec. 4, 1926.

To City Inspecting Departments,

Subject: Use of Gelatine in Buttermilk.

Sirs:—It is rumored that some organizations are using gelatine in the preparation of buttermilk. This is in violation of the provisions of Section 10 of the general dairy law pertaining to adulterants, wherein it is stated:

......"It shall be unlawful for any person to produce, manufacture or prepare for sale, or to sell, or to offer for sale, or to have on hand for sale, any milk or product of milk, to which any coloring matter, except as otherwise provided in this act, has been added by any person or to which any gelatine or any other substance, except as otherwise provided in this act, has been added by any person to increase the consistency of such milk, or product of milk, so as to make it appear richer or of better quality......"

Yours very truly,

J. J. FREY, Chief,
Bureau of Dairy Control.

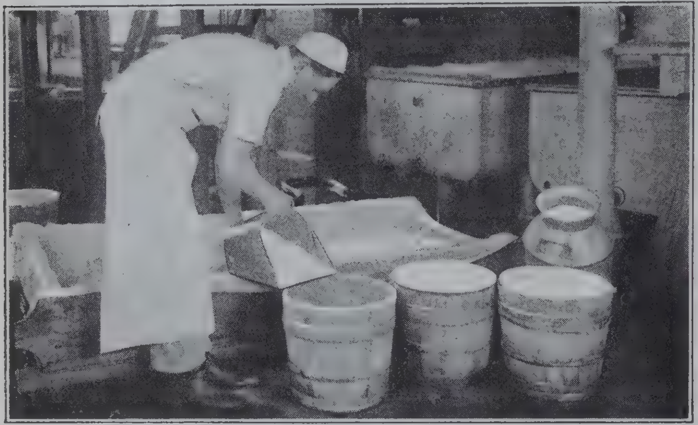
Types of Cheese Important to Milk Deal

Uniformity of Methods in Manufacture of Cottage Cheese Discussed by C. E. Lee, Gridley Dairy Co., Milwaukee. Discussion That Followed Covers Cream Cheese as Well

AT THE annual meeting of the American Dairy Science Association held in Detroit in October Prof. C. E. Lee, of the Gridley Dairy Company, Milwaukee, in discussing the manufacture of cottage cheese said:

"No type of cheese is of greater importance to the milk distributor than cottage cheese. Next in importance is cream cheese.

"Many of us who have watched the development of the cheese industry for more than thirty years, realize that many changes have taken place. There was a gradual change from handling cheese as a farm product, made in a rather crude way, to the present modern factory and equipment.



Whey removed on cheese cloth strainer, completely drained, and ready for bulk packing in standard butter tubs.

"Many investigators have devoted years of study in solving the many complex problems confronting the manufacture, ageing and marketing of the various types of cheese. The work that these men have done is very commendable, but it appears to us that the cottage cheese field has been left practically untouched.

Good Milk Necessary.

"Great care must be exercised in the selection of good clean, flavored milk to be used for cottage cheese making, otherwise the finished product will not prove satisfactory.

"It is a known fact that rennet types of cheese, cheddar, Swiss, etc., to a large extent reflect the quality of the milk used. Off flavors in milk are concentrated in the curd. The Wisconsin curd test was worked out on that principle. Too often milk is used for cottage cheese when it should be returned to the producers. When such milk is used it is reflected in the sales.

"Good milk, free from off flavors, pasteurized and properly refined, will always result in a clean flavored curd.

"In our plant where some 20 thousand pounds of milk is converted into cottage cheese daily, it is found that best results are obtained by adding not over one per cent of starter and setting the milk at a temperature of 70 to 72 degrees for a period of twelve to fourteen hours.

Proper Cook Determines Texture.

"The rapidity of cooking and the temperature reached, determines largely the kind of curd desired. As soon as the milk is cut, water having a temperature of 150 degrees is turned into the vat of milk. S
vats are never filled within six inches of the top
mits adding considerable hot water before allow
of the mixture of the whey and the water to ru
the gate. As the draining continues, additio
water is added until the entire mass of curd, w
water has a temperature of 108 to 110 degrees.

"When the desired firmness of curd has
cured, the warm whey and water is drained off,
water is added to chill the curd. When this is co
the curd is placed in draining racks for a perio
or two hours before packing.

"There is a large demand for cottage cheese
10 pound containers. During the past year our
been that of using a single service tin containe
the same package as is used in selling bulk lard.

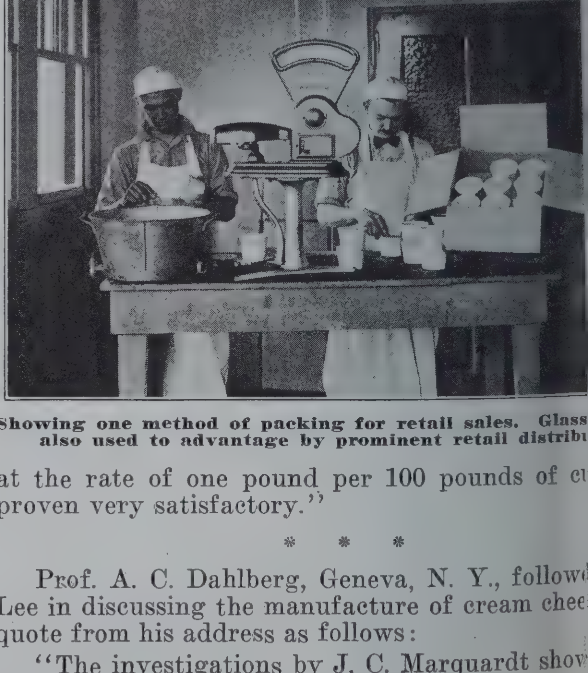
"To our retail trade a 12 ounce glass contain
very good satisfaction. The glass jar or cont
handled in the regular pint milk case. These
easily filled because twenty are filled at one time
being removed from the case. Glass has cert
recognized sanitary advantages beside making
sible to add larger quantities of cream to the cur

Cream Improves Quality.

"Very seldom is it advisable to add cream to
cheese sold in bulk, or to the hotel and baker tr
is also questioned by some whether or not cream
to any great extent be mixed with curd before i
to the family trade.

"Cream adds greatly to cost, besides shorte
time that cheese can be held before taking on t
acidity. To us, cream is very essential in putti
package that is always ready to be served unle
additional seasoning is desired.

"A mixture of five pounds of curd and one p
milk containing 10 to 11 per cent of butterfat
at the rate of one pound per 100 pounds of c
proven very satisfactory."



Showing one method of packing for retail sales. Glass
also used to advantage by prominent retail distrib

(Continued on page 96)

DE LAVAL

Will a New Series De Laval pay for itself on whey?

No one questions the ability of any separator to *get* enough fat from whey to pay for itself in a short time. But will a New Series De Laval *save* enough fat over another separator to pay for itself in a reasonable period?

—Well, you might ask Mr. Geo. C. Guelig, proprietor of the Calvary Cheese Factory, Calvary, Wis., who writes:

"We recently installed one of your New Series No. 70 Separators. We had used for 8 years a No. 40 De Laval which we thought was a wonderful machine, but the new 70 is a world beater. We have taken several samples of skimmed whey and couldn't find even a trace of fat. As we get more cream every day the machine will pay for itself. With the new improvements the new machine should run for many years without trouble."

You owe it to yourself to find out how long it will take for a New Series De Laval to pay for itself in your plant.

A Solution to your Heater Problem

AFTER seventeen years the original patents on the Chester Barrel Heater are just running out.

During this time we have applied our barrel heater to the many heating problems that have confronted the handlers of milk. We have solved with the Chester Barrel Heater, or a modification of it, every heating problem except one that confronts the American dairy industry. Eventually we will solve the one exception.

THE MILK PASTEURIZING PLANT PROBLEM
THE CONDENSERY
THE CHEESE FACTORY
THE POWER PLANT
THE PRE-HEATING FOR SEPARATORS, CLARIFIERS AND FILTERS
FOR SWEET CREAM
FOR SKIM MILK

We can utilize all of your exhaust steam. We can control positively and automatically.

We believe we know the heater problem and that we can solve your problem in an economical and practical manner.

In order to make it convenient for you to put your problem in our hands we have prepared a series of simple questionnaires relating to individual conditions. If you will tell us something about your difficulties we will send you the proper questionnaire. You can fill this in a few minutes and return it to us. From the information you send we will be able to prepare figures and information which are the result of actual experience in solving similar problems in other plants.

We guarantee that no unfair use will be made of the information you send and that you will not be annoyed by solicitations for business.

Write for the heater questionnaire now.

Loton Horton Dies in France

President of Sheffield Farms Company Dies in Nice, France, While Touring With Mrs. Horto An Outstanding Figure Among Men Who Have Been With the Milk Bottling Industry.

HIS friends all over the world were shocked to hear of the death of Loton Horton, which occurred at Nice, France, on December 15. We say all over the world, because wherever dairying and health work is known the name of Loton Horton is revered. He numbered his close friends by the thousands.

LOTON HORTON.

He was stricken by pneumonia while touring France with his wife, and was 72 years of age. The body arrived in New York City on December 30, and the funeral services were held in that city on January 3 Interment was at Middletown, New York, his boyhood home.

We are privileged to reproduce a sketch of his life work which appeared in the New York Times the day following his death. It reads as follows:

Loton Horton, president of the Sheffield Farms Company since its organization in 1902, and for more than fifty years engaged in the business of supplying milk in New York City, died yesterday at Nice, France, according to a cablegram received by his sons last night. Mr. Horton was 72 years old. He had been visiting in Europe with Mrs. Horton and was planning to return to this country when he was stricken with pneumonia. For several years past he had been troubled with a weak heart, and it is believed that this was a contributing factor to his death.

Mr. Horton's city home was at 135 Central Park West. In addition to his widow, who was Miss Tillie Spieker of Zurich, Switzerland, whom he married in 1917, he is survived by four sons, Daniel S., Ralph, Chauncy and Jerome Horton. Mr. Horton was married three times.

Mr. Horton was born on an Orange County (N. Y.) dairy farm in April, 1854. His mother died when he was three years old, and his father died seven years later. Young Loton Horton was bound out to an uncle by marriage, who had agreed to provide a home and educate him in return for the interest on $2,500, Loton's share of his father's estate, which was in a savings bank.

Starts as Milk Wagon Driver.

The young farmer boy knew nothing of the details of this agreement. He spent his time on the farm doing the chores which seemed never-ending, and as he grew he was doing the work of a full fledged hired man. When 16 years of age young Horton became disgusted with his situation.

He had a long talk with his Uncle "Tim," a brother of his father. The upshot was that he left the farm where he had been working and went to Middletown to live, with the understanding that he was to be permitted to attend school in town.

At the end of the school year young Horton came to New York City to drive a milk route for another uncle. The conversation which determined Mr. Horton's future did not seem particularly pregnant with possibilities at the time. His Uncle Chauncy said: "Bub, how'd you like to drive a milk wagon in the city this summer?"

Loton would and did. Mr. Horton used to take delight in telling of his experiences as a raw, gawky country boy on a city milk route. The only way he remembered his way was to count the blocks and houses, and he said that it was several weeks before he realized that his route crossed and recrossed the same streets.

When his first month's collections were checked u found that he had turned in more for one month t preceding drivers had turned in for a three-months Young Horton returned to Middletown for two more of school and at 18 came to the city to take a perma on the milk wagon.

When he received his money at the age of 21 he route which he used as capital for joining the partne the Slawson brothers, who were also his uncles. He c with this concern and in 1901 bought out the busine the death of two of the brothers.

The following year marked the greatest forward Mr. Horton in the matter of handling milk. That year the consolidation of the Slawson Company, the T. W. Company, a business dating back to 1841, the Sheffiel Company and the Tuthill's Sheffield Farms Compan assets of the combination were only $135,000. To company has more plants than it had routes in those

Louis B. Halsey, a lawyer, who had turned to d operated the Sheffield Farm. He was years ahead of petitors and in 1897 brought a German chemist to the first pasteurization machine. Halsey had deve herd of pure Jersey cows and was constantly experi with better methods of handling. He devised a sch freezing blocks of skim milk and putting a large bl each can of rich milk. Thus the milk arrived sweet a

Dr. Royal S. Copeland's Tribute.

It was this farm which gave the name to the vas ization which now distributes milk throughout New Yo Mr. Horton became interested in the pasteurization and employed it for his own milk.

Although he had very little formal education, Mr. was recognized by his associates as a man with an ex nary capacity for study. He knew both men and the of ideas. He had been at the forefront in all meas develop better methods of handling and caring for mi the time it left the farmer until it reached the consume

Dr. Royal S. Copeland paid him high tribute at a in 1922, when Mr. Horton celebrated the anniversar fiftieth year in the business, when he said, "No man York City has done as much to reduce the death children."

Mr. Horton had been under fire several times be charges that he was at the head of a "milk trust" a ficially controlling prices. The mayor's committee co an investigation in 1917, and in 1919 there was a state and city investigation after an increase in pri been announced.

Mr. Horton also had a prominent part in break strike of drivers in 1921. He obtained an injunction interference, which stripped the milkmen of the p harass dealers, and this proved an effective weapon ning the strike for the company.

Mr. Horton had many friends in other lands of these, E. A. Evans of the United Dairies in L upon learning of Mr. Horton's death, wrote us as f

London, England, Dec. 22, 1

"I had the great pleasure and honor of spending t with Mr. Horton in Munich at the end of Novembe thought it would be of interest to your readers to kn at that time he was looking forward, with great plea his return to America with his new Rolls-Royce, in or he might enjoy his leisure and see more of your cou

"We, on this side, have always held him in the ve est esteem, and looked up to him as one of the pione consistently advocated pasteurized milk, and who wa the leaders in the development of the bottled milk ind

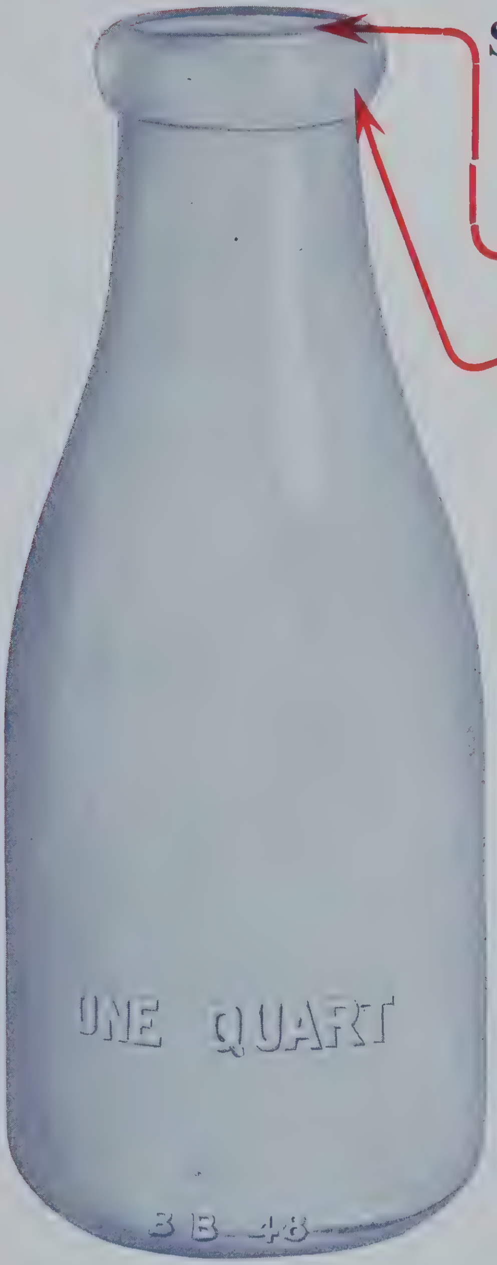
"His opinions have always been placed unreser our disposal, and whenever we have sent any of our men out to the States, he was always the first freely help, and allow them to gain experience in the Sheffie plants.

"I have known him personally for some 20 yea found him one of the most generous-hearted and minded men I have ever met.

"The two days I spent with him as his guest in showed me another side of his character which I shal treasure.

"We grieve with you in the great loss the indu sustained—both on your side and on ours."

Automatically Processed Milk Bottles of Quality



Six Little Details All Big

1. Round cap seats that hold the cap
2. Well formed heads designed to obviate chipping
3. Accuracy in capacity uniformly maintained
4. Glass clear in color
5. Scientifically annealed (tempered) giving maximum strength
6. Grace in design, making a pleasing package

IE RELATION OF BUSINESS FAILURES TO ADVERTISING.

ow actually unprogressive is the milk dealer who not use newspaper advertising? How indispens- s newspaper advertising? Investigations of cur- usiness failures in several large cities reveal some sting percentages.

Kansas City, there were 149 business failures in le year. Of these only 9 used newspaper adver-

is gave 94 per cent of the failures as non-adver- At Chicago, 98 per cent were found to be non- tisers. St. Louis concerns failing in business and no newspaper advertising, made up 94 per cent of ty's failures.

can hardly be argued from such statistics that aper advertising contributes to business failure! g the reverse deduction, that newspaper adver- is indispensable to business success, is probably se going somewhat too far. The fallacy can be nstrated in the success of retail stores which do se newspaper advertising. The strong suggestion, er, that newspaper advertising contributes mark- o business success; moreover, is generally used by sful concerns, is sound.

e fact of the matter is that advertising is as es- l a function, nearly, of the business organization selling itself. More and more advertising enters he distribution process. If only to meet competi- business must employ it. To achieve any special apid measure of sales success, advertising is most ensable in modern days.

te, however, we have not limited our remarks to aper advertising. We have used advertising in al. Most investigations put display advertising gh windows, as most primary in nature. News- advertising is next in popularity of use. Other tising, such as direct mail, billboard, handbill, mo- icture, and so on, follow.

orking out a successful advertising scheme, dairy managers frequently use window advertising, aper advertising, and one or more other types of ising, in combination. Two fundamental features mbination are window advertising and newspaper ising—or window advertising and direct mail ad- ng.

asionally the manager makes handbill advertis- ghly important in a combination.

you are not sold on advertising, banish your re- g doubts, and whole heartedly believe in it. The n for you is not whether to use advertising, but w to use it—how to make your appropriation and it up among the different varieties of advertis- w to extend the several divisions most effectively.

business man who attempts to dispense with ad- ng is as badly disadvantaging himself as though pensed with sales people, thinking to effect an y. Business failures are notoriously non-adver- Business successes are as conclusively adver- s

Publicity Essential in Milk Business

Problems of the British Milk Dealer Not Unlike Those of His American Cousin. Milk Authority in England Gives Some Good Advice About Advertising

By R. T. HAHN*

WHEN we check up very carefully, it is really remarkable how familiarity does tend to dull our senses. If we take perhaps the commonest and most essential everyday necessity of our lives, such as milk, we find that the total ignorance displayed by the ordinary man in the street is simply appalling. Apart from the fact that he sees it 365 days in the year on his breakfast table, and probably uses language more forcible than polite on the first morning in three years that the milk has been an hour late due probably to the fact that there has been a breakdown at the dairy, or No. 10—his van—has skidded and overturned at the bottom of the main street, the roadway strewn with broken bottles and milk, or to the hundred and one things which might happen any day, but which, luckily for him, don't. Apart from this fact he knows nothing whatever about where it comes from, how it is handled, treated or distributed, and what is more, he doesn't care either, or try to find out for himself.

The big problem seems to be just this—where on earth is the beginning? Where and how can we educate the general public to the fact that more milk should be drunk? The easiest way out of the difficulty is obviously to tell the public what milk is, and in what way it is good for them. Another way is via the publicity route. This latter we can subdivide into three parts, viz., advertising, propaganda and exemplifying

This is a big job, but a job which the National Milk Publicity Council is tackling manfully, and already, after a comparatively short campaign, their efforts seem to be bearing fruit. The whole crux of the question is this. Can milk advertising and propaganda, etc., be made interesting enough to attract the attention of the passerby? Can a lecturer hold his audience sufficiently well to deliver a lecture which will go right home, covering all the vital points of the subject and yet not be too long to become tedious and wearisome? It is a subject that needs a whole lot of hard thinking out and a subject that has to be attacked very carefully and systematically.

It is all very well for people to agree with you on the point that no one is too old to drink milk and that the nation as a whole should drink more, but what is the good if they don't practice what they preach? They will agree with almost any argument in favor but they have forgotten everything about it five minutes after the discussion is closed.

This is just the thing we don't want. We want the public to get it right back into their heads that they ought to drink more milk and we want them to remember it, too!

The dairyman must take upon himself a lot of this educating business. He must tell his customers that it is good for them and why. It needs telling in a few simple words. If you get twisted up in bacteria, temperatures and the like, your customer is soon going to be a very bored listener and in nine cases out of ten, after you have spoken at great length on the subject, she will know no more about the matter than when you started your rigmarole. Besides, if you have too long a tale to relate, look how it is going to hinder your daily routine, to say nothing of hindering her business. You can't afford to waste muc and a few well-directed and pointed words is al required. You can enlarge upon the subject aft when she begins to get interested and begins to a few questions about it. Once her curiosity is th ly aroused, she will almost move heaven and satisfy it. Just start off by telling her that mil up strong bones and healthy teeth and muscle— what it will do for baby, and she will soon want all about the rest.

Attractive Advertising Essential.

By advertising, I mean good, sound display. good poster or a well dressed window carries weight and both can be made very attractive must be got up attractively enough to make a m twice at them. Are there many people who do n nearly all Kruschen ads and Bovril posters off by It is only because they stand out in the mind public, or are really good ads and well execute want them to know the milk posters off by he The only way to do this is to get out some real attractions and novelties.

The big aim of poster work should be to e and not frighten the public. To show a horri ture of the Grim Reaper gathering in his harve mother grieving over an emaciated, undernourish is nauseating and excites unpleasant sensatio present day people don't like these things. Besid tend to turn away would-be users of more milk. a case of advertising what dirty milk won't do but what good, clean and pure milk WILL do. them the rosy side of life and they appreciate more than the grim aspect.

In press write-ups or circular advertising stress too much on bacteria in milk. It may enough that your competitor sells dirty, bacter milk and that yours is treated and free from pat germs, but if you overdo the bacteria stunt, peo soon begin to think that milk is nothing short of It is, of course, advisable to touch lightly on the of contamination, but don't give it a very pr position in your write-up or letter.

There is no doubt that the reports which h peared in newspapers from time to time aprop demics of poisoning being traced to milk, ice cre dairy products have caused a lot of people t twice before they buy any more of that particul modity. These reports were nearly always quash sufficient publicity had been given to the matter comment from the ever-ready crowd of doubting ases, but, while the original reports often occ very prominent place in the paper, the later re nying the authenticity of the former were, mo than not, tucked away in some obscure corner, proper heading, and consequently escaped not still in the public's mind "the epidemic of pois —— was due to milk or ice cream from ——'s —an opinion which perhaps more often than not ruination of that particular man's business as s affecting the trade of all the other dairymen in istrict.

Novelty in Advertising.

indow display and dressing is another means of ganda. A good, well-dressed and clean-looking w will attract the passerby. It is by no means an ask to dress a window of dairy produce. The to be sold must be displayed in the most effective er. Don't overcrowd the window. It should ap- when dressed, as you would like to see it, were e man on the street. There is nothing to attract ion like a novelty. The ever-pouring bottle, show- ilk flowing out of a bottle into a glass, is sure to " the public. It is something out of the ordinary, lty, interesting to young and old alike, who, after ing it for a while go away and wonder how it is This sort of thing stimulates public interest.

out two years ago a well known London firm on a good window publicity scheme. In the win- hey had three bonny babies—triplets—and the s this drew and the attraction it presented is well y of note. Not an expensive window display, you gree, but one that was really enterprising and al. There is nothing like getting at the public he real thing. Pictures and photos of babies don't half the weight as the babies themselves. Let the tell their own tale of health. This "child ap- is a big asset in milk and dairy advertising. It o talk of babies in connection with a dairy busi- ow.

ere is yet another method of window advertising , unfortunately, is not within the scope of every nan. And that is a portion of the plant in the w, or in a prominent place in the dairy. One of gest firms in the Midlands hit on the idea of filling apping their bottles in the window, and it kept a man busy to clear the sidewalk, until the novelty off. An ice cream brick moulding and cutting ma- would excite quite a sensation. Originality is a ing now, and this, together with an artistic tem- ent, is the main item in window dressing. It needs hologist to dress a window to meet with every- taste— but as we know, this would be an utter im- ility. The aim, however, should be to make your w look as attractive and original as possible, with- owing a nauseating and crude element to creep in.

A Locomotive Run By Milk as Fuel.

learn by experience that the setting out of ex- will talk a lot more than mere figures. They tual concrete facts and therefore impress them- upon the public mind more. When they brought train driven by milk in America, this did not fail y its appeal direct to the public. They flocked r thousands to see if a locomotive COULD really on milk. They wouldn't believe it until they ac- saw it for themselves—then they went away and about it. Result, this milk business in the states p another notch in the estimation of the public, ey realized that milk had power.

n, again, school clinics are very numerous; a num- children are fed daily with a certain quantity of nd an equal number do not receive this ration. ights are carefully recorded at the beginning of t period, record cards kept and daily progress The results are then published and the difference ght between the children fed on milk and those really remarkable and does not fail to interest ents. If they see that their child is gaining one- und a week because it is fed on milk, they are going to keep it at it, and carry on with the good work started.

These small films shown at picture theatres, if made simple and interesting, cannot fail to carry a big appeal, but they must be of the right sort. If they are made too difficult and uninteresting, then the children will not understand them, and they will soon get bored. If, on the other hand, they are on too simple lines, they will be uninteresting for the parents. A small plot should run through the film, or it will not interest the present day picture-goer. Films showing the production, handling and distribution of the milk should be shown. These will encourage the housewife to obtain the product which she knows is properly handled. This promotes not only the drink MORE milk habit, but also the PURE, CLEAN milk habit!

School children's plays, embodying the milk subject, is another means of propaganda. There is nothing like getting at the parents through the children. They tell the tale of health and happiness. Tell a child, or rather impress a child, and nine times out of ten the appeal is far more productive than if it is made direct to the parent.

The tale of health that is contained in a bottle of milk is one that needs getting right home, and there is no doubt that one of the best mediums is the child itself.

⁂

THE DAIRY SITUATION IN SWITZERLAND.

Under the heading of "We Will Now Drink Milk," the "Gazette de Lausanne," issue of October 15, 1926, published a communication from the Swiss Central Union of Milk Producers of which the following is a resume, transmitted by American Consul James R. Wilkinson in a report made public by the department of commerce.

The Swiss Union of Milk Producers is forced, owing to the crisis existing at present in the butter and cheese market, to pass a resolution reducing the price of milk two centimes per liter effective November 1, 1926. The producers consequently expect a similar reduction in retail prices.

The present butter and cheese crisis is due to various causes, the more important of which are enumerated below:

1. The large imports of foreign slaughterhouse animals have naturally forced the decrease of slaughterhouse consumption of Swiss cattle, which fact has in turn led to a natural reduction in prices quoted for Swiss cattle.
2. Consequently, the number of cows in Switzerland as well as the quantity of milk produced has increased.
3. But the export of cheese and condensed milk from Switzerland has decreased, owing partly to the depreciated currencies and partly to excessive import duties levied by importing countries. It has been estimated that present Swiss exports of cheese and condensed milk represent only two-thirds of pre-war exports.
4. On the other hand, Swiss imports of butter and cooking fats have increased since pre-war days, thus presenting another difficulty to be faced by the producer.

Swiss dairy merchants have expressed a hope that in the future public preference will be given to Swiss rather than to foreign milk, cheese and butter.

⁂

MILWAUKEE FIRM BUYS A COMPETITOR.

The Waukesha Milk Company, Milwaukee, Wis., has purchased the Quality Dairy Company of the same city and is now operating both plants. This increases the business of the Waukesha Milk Company to 130 wagons and makes it one of the leading milk distributing companies in the Northwest.

Dairy Federation Lays Plans

Meeting in Chicago Results in Outline of Activities for the Coming Year. Officers Re-elected

THE activities of the American Dairy Federation were continued for another year by action taken at the annual meeting in Chicago December 1 when all officers were re-elected with two exceptions. The changes are W. A. Wentworth of Columbus, Ohio, who succeeds M. D. Munn as a member of the executive committee, while no one was named in place of John O. Miller either as vice-president or member of the executive committee.

It was very definitely decided by vote at the afternoon session that proposals to broaden the scope of the federation into a general budget raising activity to finance other activities could not be approved at this time. The federation by a unanimous vote, however, approved the emergency budgets submitted by the National Dairy Association and for urgently needed new work by the National Dairy Council, as well as the budget for the federation itself. President Bailey was instructed to appoint a "co-ordinating committee" to consider plans for the equitable distribution of the burden of raising these funds.

This committee was appointed to consist of the presidents of member organizations. President Bailey states than an early meeting of such a committee will be called.

Officers elected for the ensuing year are: E. M. Bailey, Pittsburgh, president; no vice-president; J. A. Walker, Chicago, treasurer; executive committee — producers' group, no election; distributors' group, C. Oscar Ewing, Louisville, Ky.; manufacturers' group, Dr. George L. McKay, Chicago; machinery group, Walter S. Cherry, Cedar Rapids; breed association group, Charles L. Hill, Rosendale, Wis.; educational group, W. A. Wentworth, Columbus, and for the dairy press, A. J. Glover, Ft. Atkinson, Wis.

A. M. Loomis of Washington, D. C., was continued as secretary.

A resolution committee reported five resolutions favorably and the report was approved. The resolutions briefly summarized were: (1) Asking the bureau of agricultural economics to separate dairy and poultry products hereafter in their prices studies and publication of index comparisons; (2) approving the work being done by government agencies for the control and eradication of bovine tuberculosis; (3) asking the bureau of agricultural economics to report farm price of butterfat sold, instead of farm price of farm butter; (4) asking congress to place all competitive imported oils and fats on the dutiable list, and against any reduction in existing rates of duty on oils and fats; (5) urging the industry to oppose false and misleading propaganda directed at decreasing the amount of dairy products used in the diet.

Two nationally known speakers were on the forenoon program, Dr. Carl W. Larson, chief of the bureau of dairy industry, Washington, D. C., and Dr. E. V. McCollum of Johns Hopkins University.

Dr. Larson spoke on "The Dairy Industry and its Opportunities." He said this industry now produced one-quarter of the farm income of the United States, an income greater than that of all other animal industries combined, and greater than the combined production of the cotton, wheat and potato crops.

"Its opportunities," Dr. Larson said, "lie in the fact that progress in increasing the milk and fat production of dairy cows has now shown that the increasing d for dairy products due to population and per ca crease can be met for 40 years to come without i ing the number of cows. Better cows, better ca better feeding," he said, "will do this for the indu

Twenty per cent of the food buyer's dollar no for dairy products. This is wise expenditure fo this 20 cents he gets more than 20 per cent of the food, 38 per cent of the protein food and in additi minerals and accessory or vitamine elements alm yond value.

He quoted Dr. McCollum as saying that the cent now spent could be increased to 30 per cen efficiency, economy and benefit to national health.

Dr. McCollum's address was a resume of hi known analysis of the place of dairy products diet. To this he added a review of the benefits have come to dairying through research, inventi energy—mostly outside of the industry itself. " no industry," he said, "that has profited so great has done so little in and of itself."

His address was a plea for the industry to assu burdens and responsibilities of protecting and a ing itself.

The budgets, presented and considered by a budget committee, reported favorably, and appro the annual meeting, called for $57,000 to carry National Dairy Show by the National Dairy Assoc $52,000 for urgently demanded new work by the al Dairy Council, and $14,600 for committee and ington office expenses by the federation itself. committee which considered these budgets consis President Stanley Ross of the National Associat Ice Cream Manufacturers, Secretary Lewis W. Mo the American Jersey Cattle Club and A. R. Wise Pittsburgh Dairy Council.

A letter of withdrawal from the federation fron D. Miller, president of the National Co-operativ Producers' Federation, was read. This was laid table and the officers instructed to request the mil ducers' federation to reconsider and withdraw letter.

USTROUS ➶ ➶ DURABLE ➶ ➶ WASHABLE ➶

WHITE PAINT

Thousands of industrial plants have found that Barreled Sunlight best combines the qualities they want in interior paint—and at the lowest cost per square foot of surface painted!

UARANTEED to remain white longer

THE CLAIM of lasting whiteness that we make for arreled Sunlight is backed by his definite guarantee:

Barreled Sunlight will remain white longer than any loss paint or enamel, lomestic or foreign, applied nder the same conditions.

Practical proof of this quality ver a period of years is one eason why Barreled Sunlight is he most widely used white aint for industrial interiors.

Another reason is *durable leanliness.* The surface of arreled Sunlight is so smooth it an't hold dirt embedded, and ashes like tile. Repeated washg does not wear it away.

And because this lustrous paint reflects light of just the right quality, it greatly improves working conditions.

With all these advantages, Barreled Sunlight *costs less per square foot of surface covered.* Extremely opaque, it covers a larger area with a given quantity of paint; and containing no varnish, it flows so easily with brush or spray that there is a saving in labor hours.

Sold in 55- and 30-gallon churn-equipped steel drums, and in cans. Where more than one coat is required, use Barreled Sunlight Undercoat first. See coupon.

Building a Milk Business on High Qual

New Plant in City of 10,000 People Charges Two Cents Per Quart More for Its Milk and Builds Up Fine Patronage by Selling Better Milk

By ROY D. SNYDER*

IN COMING before this organization of dairy and milk inspectors as a small milk dealer, I am hoping to present to you that phase of my subject which is of mutual interest. There are some dairymen who look upon a visit of a milk inspector or health officer in much the same light as an earthquake or similar catastrophe, and who, through lazy indifference or ignorance, allow anything to slip by as long as they can "get away with it." Then, too, we have inspectors and officers who seem imbued with that same kind of indifference, or who are over enthusiastic, inspectors who allow their enthusiasm, which is usually short lived, to run away with them and in their attempt to accomplish things over night and without careful consideration, usually accomplish nothing. (Of course, present company is excepted in either case.) It is not possible to obtain a pure milk supply throughout the state without proper inspection, but it is still more impossible to obtain this objective without the assistance of the milk dealer who is interested in marketing a high grade product. There is no room, either in the industry or in the realm of health officers and milk inspectors, for any of these types, and their elimination, together with co-operation on the part of those really interested in the matter, is the only way in which an adequate, safe and clean milk supply can be developed.

The larger cities of the state are fairly well controlled by local and state inspection. They are also fairly well equipped with modern milk plants and dairies. If, however, the general health conditions of the state are to be bettered, these smaller communities must enjoy the same control and inspection and must have the same modern equipment. A sketch of our field will make it evident, I believe, that we have the typical small community. We are located in a town of 10,000, midway between two towns of practically the same size. Within a radius of ten miles we have approximately 50,000 people. The milk supply in this district was about 30 per cent pasteurized and the remainder raw—with some very raw. The pasteurized milk was practically the only milk sold in bottles. This we considered to be a most suitable location for the erection of a small, modern milk plant.

The Plant.

It was our aim to offer to the public the best possible product and then to improve it continually. With this in mind we began laying out our plant. Our capacity at the present time is 2,400 quarts but the equipment is such that it can be economically operated at 1,000 quarts. We estimated that this margin of 1,400 quarts would take care of any growth we might enjoy for several years. I shan't waste any time going into the details of the equipment and layout, except to state that the plans were not evolved over night but represent years of cooperation with the Pennsylvania department of health, and much experience in the plant of E. D. Snyder, at Hazelton. We filter the milk cold, heat in a coil vat and cool over a **covered** surface cooler. One thing I should like to mention in regard to design, however, and this I believe to be quite important in plant design, perhaps more so than is really realized today. That is, t milk should be handled as little as possible, a means that the total feet of piping should be at a lute minimum. Our bottle filler stands about t from our receiving tank and in this space the filtered, pasteurized and cooled. In this process it through only about twenty feet of sanitary pipe to this that we attribute the fact that we produce with a most excellent flavor.

After bottling the milk passes directly to a erator, the temperature of which is held at 40 deg automatic refrigeration. Our plant, real estate an equipment represents an investment of about $ which figure gives you an idea of what the a small milk dealer is up against in a financial wa were quite fortunate in securing equipment of reli Our bottle washer is of the pressure type, the cool filter so designed and constructed that they are easy to clean and the refrigerating unit, as men above, is entirely automatic and admirably suited dairy industry.

After our plant was built and ready to oper estimated our operating expenses and realized would be impossible to operate profitably at the p ing price of ten cents a quart. The price paid producer in this locality was five and one-half a cents per quart, and it was quite evident that if w to obtain the quality of milk we desired we shoul to pay the higher price. That would leave us four-cent margin, on which we could not possibly o a clean modern plant and produce a wholesome, ful product. As I said before, we set as our stan product of the highest quality and then a little b ter, and we resolved to stick to it. Twelve cents w lowest figure we could come out on, so here was our osition. We had to sell our milk at two cents a higher than the prevailing price. Furthermore we strangers in town, so you see that here we had a re portunity to determine whether quality meant an at all in a community milk supply. As a start w chased one small route and on July 1 last year be sell our pasteurized milk for two cents a quart mor any other milk was being sold for in the town.

Twenty Per Cent Quit.

Pasteurized milk, we found, meant little or n to most of the people we had as customers, so we su them with pasteurized milk for one week witho nouncing it. We then saw each customer pers told them of the increase in price, explained our and our product to them and tried to hold their p age. The first week we lost about 20 per cent trade. Less than one-half of one per cent stopp cause of any noticed undesirable qualities of the the rest told the truth and said the price was the Then a few folks became interested enough to vi plant and some of them began to notice that th kept longer and had a better flavor, and there uniform cream line, and that the milk was ice c the hottest days in the summer. Our business and in about six months we have enjoyed an in- of 150 per cent.

---

* Manager, Snyder Dairy, Bloomsburg, Pa., at meeting of the Pennsylvania Association of Dairy and Milk Inspectors.

e of the first things we did in an attempt to secure usiness was to interest the board of health and the ians. We found these people very much inter- and their support has meant considerable. The was attempting to control the milk supply through se of the advisory board regulations of the Penn- ia department of health, but they received no sup- t all from the milk dealers. The regulation requir- e examination of all milk handlers and the inspec- y the board of health, of all dairies supplying milk community had brought no results at all. We im- tely applied for this examination and inspection, ere the first plant to have the same, but up to this nly one other dealer of the fourteen selling milk, mplied with this regulation. Pursuant with our policy, however, we have complied with every of the regulation and will continue to do so er it is enforced or not.

forts to place in the hands of the public a high product require the securing of the producer's in- , and this we are trying to do. We make inspec- of the farms supplying us and have done consider- vork with the sediment test, which test, I believe one of the best means of increasing the production urer milk. Bacteria counts, reductase gradings, ean little to the average producer but when you him the discs from the sediment test it is something e is bound to understand.

Ran Daily Tests.

veral months ago the Pennsylvania department of 's milk testing laboratory visited us and ran some on our producers. The results were not what we d, but we had been in the business then about four s and previous to our entrance in the field there een no effort at all to have the producer furnish the st milk possible. In order to get some of these to resent state of cleanliness, we ran daily tests for week while the producer attempted to find just the dirt was gaining entrance to the milk. It was for the most part that these men wanted to pro- clean milk but had just grown into practices that this impossible. Our supply now is not up to our rd but we are going to get it there and feel quite raged over our results up to this time.

w then, some of the difficulties that we have en- red. We have a clean plant, modern equipment, e spending considerable time, effort and money in ing the highest grade raw product but we are in tition with a product which, from the health stand- is inferior, but which can be and is marketed at a r price. Some of this cheap milk is pasteurized falls short of standard. There is only one reason his inferior product can be sold at a lower price at is because it is not necessary for these dealers rve the precautions that we do. Generally speak- here has never been any desire on their part to he standard. Their places and product are not ted and so this desire was never thrust upon them.

Legislation Can't Do It.

ase do not misunderstand my motive in this state- I am not complaining because of any apparent on the part of anyone. I merely want to show the general healthfulness of a small community's upply is to be raised, and this is general, then in vay there must be an elimination of this lack of There must be a desire to furnish the people with the most wholesome milk possible. Legislation cannot do it alone. It must come first through a demand for a better milk, and then legislation as a protection that this demand will be satisfied. Perhaps a little encouragement to the dealer to sell milk as it should be sold would not come amiss, encouragement in the form of publicity by the health department or call it an educational program, if you wish. If you are to have a satisfactory milk supply throughout the state, somebody must be interested in placing the same on the market in the smaller as well as in the larger communities, but unless this dealer has some assurance that he is not going to be left standing alone in his efforts to put on sale this higher quality product, then that progressive spirit is likely to lose interest and it is going to be rather hard to obtain that pure milk supply so necessary to a healthy community.

⁂

MILK PRICE SITUATION IN FRANCE.

French agricultural interests take deeply to heart the recent press campaign against an increase in the price of milk, which, in the Paris district, has led to the maintenance of the retail price at 1.50 francs per liter, or approximately 5 cents per quart, and draw the attention of the government to the danger of prohibiting an increase in the price of a staple commodity if such an increase is fully justified by general conditions of production, states George F. Wadley of the American consulate's office in Paris, made public by the department of commerce.

The delegation pointed out that a milk crisis may very shortly arise unless the situation is speedily remedied. This remark is full of common sense, states Mr. Wadley, as has since been shown by events, the milk supply of Paris having decreased very sharply since the warning of the delegation and a serious shortage is now being felt. This is in great part due to the fact that the milk consuming industries are not bound by any price limit and that the cheese and condensed milk factories are absorbing, at much higher prices than are officially permitted for retail consumption sales, the greater part of the milk which normally would find its way to the great centers.

⁂

METHYLENE MILK TEST DESCRIBED.

Purity of milk is now more easily determined than ever before through the use of the methylene blue test, recently perfected, and its adoption is becoming general in Wisconsin cheese factories and creameries, E. G. Hastings, bacteriologist at the Wisconsin Agricultural Experiment station, says. The cost of the entire testing equipment is only a few dollars, and consists of test tubes, pipettes, a water bath, alcohol lamp and thermometer.

Mr. Hastings describes the operation of the test as follows: Ten cubic centimeters of milk as received from the farm is placed in a test tube along with one cubic centimeter of a solution of the common dye, methylene blue. This is kept at body temperature in a kettle of water heated by the lamp.

The dye colors the milk and the quality is determined by the length of time required for the color to disappear. The fewer bacteria in the milk, the longer the blue color will remain, and high quality milk will still show the dye after 5½ hours, while many germs in milk will cause it to lose the color in 30 minutes or less.

Catching More Business From Old Accou

Bringing the Lost Customer Back to Life Brings You Profit and Satisfaction. Don't Overlook Him

WHEN a curious little boy poked a sharp stick into a beehive to see if it was occupied, he not only succeeded in satisfying a latent curiosity, but he also achieved extraordinary results.

There are many milk dealers, no doubt, with many names on their books, which need to be stirred into similar action, for there are many reasons why that old account is dormant, and no longer in active everyday use, but it is just as well to find out exactly "why" it is in that unhappy condition.

The reasons are many fold. The customer may have moved out of the city, or simply changed address, or may have taken offense at some untoward incident that took place between the customer and someone on your staff and be unknown to you.

Of course, if the customer has moved out of town or is deceased, the account can be safely scratched off your books as dead timber, but if he has simply changed address and is still among the living, there is no good reason why you should not renew acquaintance and find out what the trouble was. At any rate, it is always a good plan to ascertain why the customer now deals elsewhere.

Perhaps a renewal of acquaintance will turn the trick; possibly some secret misunderstanding can now be straightened out nicely. At the same time, the personal contact thus established will tend to renew friendly relations again, if a strained attitude of mind has existed. Certainly, it is a good thing to find out what has become of that customer and why milk and cream and other dairy products are no longer being delivered at his front door step.

Every name on your books is worth money, and it is just as well not to forget that it costs something to get it there. Once you have a good customer on your ledgers, why not hang on to him?

By poking these old hives for live bees you may, very plausibly, discover some old friend who will willingly resume business relations again. Probably some old entanglement can be ironed out satisfactorily. Or, the customer may have left your fold for no apparent reason whatever, in which event it will be a simple matter to get that name back on your books again. And if you don't go after that particular customer, it may be just that much more difficult to get a new name to place on your ledgers—plus additional advertising costs.

If a similar situation confronts you today, why not solve the problem by whittling a sharp stick of inquiry—it will net the same results that the small boy achieved in satisfying his curiosity—and it is also good sales-management.

Nor is it difficult to accomplish the feat. During odd moments the bookkeeper can get busy with the old ledger accounts and pick out all the driftwood, compiling a complete list of names and addresses, when the account was last used, and how long it had been used before it was finally discontinued; also with a statement of the customer's promptness in paying bills as an indicia of desirability of reopening that particular account.

Such a list serves a useful purpose; it will not only form an excellent nucleus for direct mail advertising afterwards, but its principal use at this time will consist of checking up on the customer's whereabouts and inclination to deal further with you.

The list, when completed, may be classified into "age" and "amount purchased." Those accounts which have not been used for six months may be classed as "A" accounts—nine months as "B" accounts—twelve
"C" and so on down the list. Those more th
years old may be classified as "antiques" and lef
final process of selection and elimination. T
complished, you have the choice of three alterna

1. You may telephone each name on the list
the situation over frankly;

2. You may set a solicitor or the regular coll
the task of making a personal visit to each custo
so achieve the same result;

3. You may send out a series of personal
written letters to each name on the list, or you m
bine all three methods.

If you decide to use the telephone before send
any letters or a solicitor, as the best, most econom
direct means of communication, you can add th
number to each name on the list. Those without
may be checked up later with the city directory.
with telephones may be called up and a series
tions propounded. These questions should, of co
carefully compiled in advance and their use ma
according to the nature of the account and the
knowledge some one has of the customer.

However, certain pertinent questions will be f
elicit a more favorable response than others, an
achieving the best results along this line should
veloped during the interviews which follow, and
ably used thereafter.

If there is a complaint of any kind, every
should be made then and there to straighten it o
to assure the customer that there will be no rec
to warrant any more complaints. If there is no
of any kind, it is easy to re-establish connections.
appreciate your patronage, and "Won't you
again" may be some of the concluding remarks
ordinary telephone conversation, which attempts
to size up the customer's desires and inclination
further with you. If the conversation is friendly
couraging, the customer's attention may be calle
lines you now carry or any special service which
featuring since he last dealt with you, and sug
that he avail himself of them.

As to those without phones, a special solicitor
regular collector may be assigned to achieve the s
sult as a telephone interview, or each customer
appealed to in a series of letters, with return p
the mailing of circulars from time to time, blo
other advertising material, as a method of rehabi
the account. Those not reached by telephone or s
may be appealed to by letter, thus:

> "We've missed your account lately. In fac
> not been used for several months. So we're
> you this little friendly reminder to tell you t
> want to know what happened, and if there is a
> wrong with our service or our dairy products,
> to know it. And we'll appreciate your tellin
> just so many words, straight from the shoulde
>
> "Good friends are rare—and we want to hol
> them. If our service hasn't been just what yo
> —or our dairy products displeasing—or a
> about us does not strike you as just right, w
> to know about it.
>
> Cordially yours,"

If the postcard does not come back, it is
dispatch another letter, thus:

You were a good customer once, and we've missed from the ranks. We appreciated your trade and to see you dealing here again regularly.

If there has been any fault in our efforts to al- s please, pray don't decide against us by one act— n be remedied, and we're eager to do—just that! So if anything is wrong, we will do our best to e it right. Won't you give us another opportunity ailing the enclosed postcard **today**—or call me up t it personally.

Cordially yours,"

This method of rejuvenating old accounts will surprise you with results, and the summer vacation season is just the time to do it to keep your sales at normal and to get the maximum business when everybody is out of town. These personal letters and telephone interviews invariably establish the right kind of personal contact. They are sufficiently intimate to get results which no other method will achieve.

There is always a way of renewing acquaintanceship and of keeping the old customer in a friendly mood and sold to your milk business and dairy products—this is one of them.

Legal Minimum Chemical Requirements for Milk

COMPILATION and study of 247 milk ordinances and regulations in effect in 1925 in cities of the United States show a pronounced variation in the um chemical requirements prescribed for milk. olds true for the percentages of butterfat, solids- and total solids. Table 1 shows the minimum al composition of milk as designated in the vari- linances.

le 1. Minimum Chemical Requirements for Milk in 247 Cities.

e per cent butterfat	3.203
per cent butterfat	3.750
per cent butterfat	3 000
e per cent solids not fat of 99 cities with re- uirements	8.5296
per cent solids not fat of 99 cities with re- uirements	10.0000
per cent solids not fat of 99 cities with re- uirements	8.2500
e per cent total solids of 190 cities with re- uirements	11.8950
per cent total solids of 190 cities with re- uirements	13.0000
per cent total solids of 190 cities with re- uirements	10.5000

will be noted that many of the ordinances have imum requirements for solids not fat or for total Table 2 shows a summary of the various re- ents.

. Number of Cities Grouped According to Minimum Chemical Requirements.

	Number of cities	Per cent solids not fat	Number of cities	Per cent total solids	Number of cities
	81	8.25	4	10.50	1
	2	8.40	1	11.00	1
	112	8.50	85	11.50	50
	24	8.75	4	11.75	13
	2	9.00	4	11.85	5
	23	10.00	1	12.00	108
	2	....	..	12.49	9
	1	....	..	12.50	9
	..	....	..	13.00	2
al	247		99		190

able 3 the average minimum chemical require- re given for the various cities grouped according population as shown by the 1920 census.

Table 3. Average Minimum Chemical Requirements of Cities Grouped According to Population.

Population group	Number of cities[1]	Per cent butterfat	Per cent solids not fat	Per cent total solids
500,001 and over	10	3.185	8.500	11.940
100,001 to 500,000	31	3.209	8.518	11.840
75,001 to 100,000	13	3.240	8.500	11.990
50,001 to 75,000	18	3.125	8.570	11.750
25,001 to 50,000	45	3.177	8.557	11.904
10,001 to 25,000	78	3.223	8.500	11.667
10,000 and less	52	3.220	8.550	11.880
Total	247			

[1] Applies only to butterfat requirements. Several cities do not have solids not fat or total solids requirements.

It will be noted that the averages for the various groups closely approach one another.

When the data were arranged in table 2 for each individual population group, they showed that the larger cities have more nearly uniform minimum chemical requirements than do the smaller cities. As an example, all those cities within the largest population group having minimum solids not fat requirements agree on the figure of 8.5 per cent, in comparison with those cities in the smallest population group, which have five different minimum requirements varying from 8.25 per cent to 10 per cent. This same relative condition also exists with respect to both the minimum butterfat and total solids requirements.

Further studies of these ordinances relative to grades of milk, tuberculin test, pasteurization, sterilization, bottling, and temperature requirements will be presented in future letters.—Bureau of Dairy Industry, U. S. Department of Agriculture.

⁂

FRESH MILK RELATIVE TO VITAMINE CONTENT.

How does buttermilk compare in its vitamine content with whole fresh milk? This question is sometimes asked. The answer of the United States Department of Agriculture is that whole milk contains vitamines A, B, C and D. Vitamines A and D are soluble in fats and vitamines B and C are water-soluble vitamines. Therefore, when the butterfat is removed from milk there remain in the skim milk or buttermilk only such amounts of vitamines A and D as are in proportion to the amount of butterfat which has not been removed. Buttermilk probably contains most of the vitamines B and C originally present in the milk, and some A and D, depending on the amount of butterfat remaining.

Selling Health to the Nation

Noted Investigator Outlines What Milk Dealers and Other Dairy Products Distributors Should Do to Increase the Consumption of Their Goods

By DR. E. V. McCOLLUM*

I AM glad to have the opportunity to talk to you again on this occasion because I find that you still need it. I may have said some things yesterday that you didn't like to hear but Mark Twain once said: "When in doubt, tell the truth." That is what I tried to do.

The fact is that no industry ever had the opportunity that your industry has and you have been slow to see it. I hope that you see the situation in its proper perspective now and take advantage of the opportunity, not because I care in particular whether you make money or somebody else is prosperous but because it is a thing so fundamental from the standpoint of human welfare.

DR. E. V. McCOLLUM

That is where my interest came in and that is where it is today. Nineteen years ago this year I began the study of problems in nutrition and at that time dairy products had nothing to say except those who were selling dairy products, in trying to induce the public to induce the public to invest in their products, said they were good. They sold butter because it tasted better than butter substitutes. Aside from the element of flavor, they didn't have anything to say but what could be said of any other food because milk, like every other food, contains a certain amount of protein, a certain amount of carbohydrates, a certain amount of fat, various inorganic elements and the chemical analysis show you find all these things in the various natural foods.

How did we come to get a clue to the significance of milk as contrasted with other foods? It is a very interesting story. I haven't time to give it to you in detail but I will simply say that we took, at the University of Wisconsin, a new tack in experimental work in which we undertook to feed experimental animals on just one kind of food and we tested out a long list of individual foods which long experience has shown to be wholesome components of a diet, and we were utterly amazed at how many different kinds of wholesome foods we could feed and make a failure of it from the standpoint of nutrition of farm animals and laboratory animals.

Combinations of various kinds of foods that you would suppose to be satisfactory didn't turn out to be satisfactory. It is a strange thing that such type of inquiry waited so long to be done. One time Miss Davis and I fed a group of experimental rats soon after weaning, on 23 different foods and all commonly appear in
the human diet or in the rations of farm animal
there we met with failure because the diet wasn't
factory, wasn't complete in some respects, and ou
mals failed to develop even with 23 ordinary who
foods and components of a diet. There was som
lacking in all of them.

It was a very difficult matter to find out just h
experiment in order to find out what was the
with these things but one of the first things we le
was that there was something unique about certain
and that an outstanding example here was milk
other outstanding example was certain leafy ty
vegetables.

For example, we fed an animal on whole whe
he failed to grow; we fed him on wheat and any
cereals—peas, beans, potatoes and the like—st
failed to grow. It didn't make any difference how
things he had in the food supply if they were se
from a list including cereals, tubers, fruits an
products of cereals, lean meats of the muscle ty
failed to grow.

So simple a mixture as 75 per cent whole whe
25 per cent of a flour made from a leaf of a plan
as clover or alfalfa or turnip tops make a pretty
factory ration. Something is supplied by that lea
stance which isn't supplied by any cereal grain n
tuber nor any fruit nor muscle type of meat.

Again, if we feed a simple mixture of whole
and milk, we get excellent results. Why? Becaus
same something that is supplied by the leaf or lea
is supplied by milk to a type of individual who
gestive apparatus isn't suitable for consuming th
The leaf of the plant is unique and superior to any
part of the plant in its food value and there is no
food that compares with milk as a food in resp
completeness which affects all faculties.

It isn't a satisfactory food throughout life.
first place, it's too bulky. In the second place, w
contains some amounts of everything that is nec
in nutrition, it, like every other food, has its sho
ings. There are certain elements that are present
small amount to produce the best effect. The onl
that you ever succeed in nutrition is by making the
combination of foods. What is lacking in one i
vided by another.

It happens that milk is unique among all the
in that respect. That was the outcome of experi
work over about a decade. During that decade w
pened to bring to light in various laboratories i
country the existence of five substances which nev
been talked about in nutrition discussion before.
are the vitamines. We call them A, B, C, D and E

The first significant advance in modern researc
nutrition, in this country at any rate, was the ob
tion that butterfat was different from other fa
pecially fats of vegetable origin or the body fats
mals, in that it contained something which those
contain. That we now call the vitamine A. Th
increasing evidence as time goes on that a very
siderable number of human beings in various pa
the world run short of that vitamine to some e

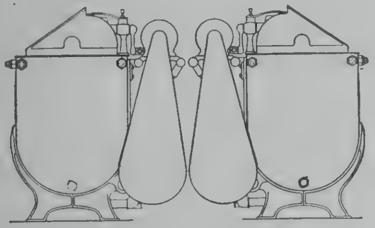
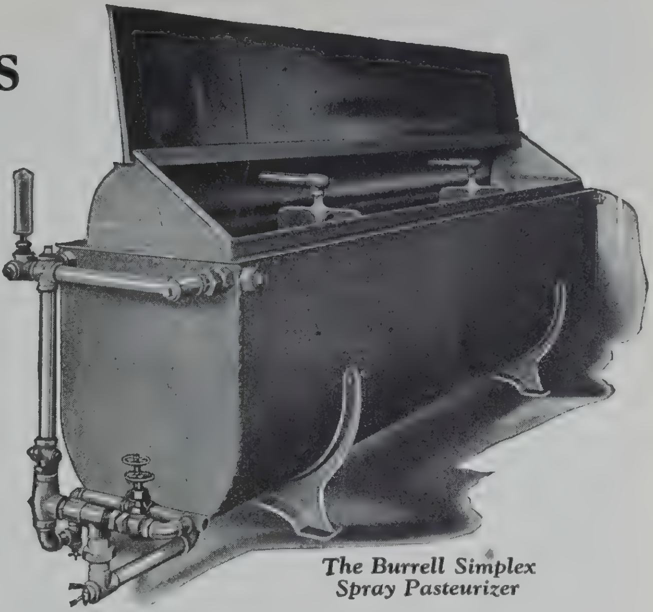
-running, silent,
supported drive.



(8) To permit the most convenient location in your pasteurizing room, the Burrell Simplex Spray Pasteurizers are made both right and left hand. Milk inlet and outlet, agitator drive and steam piping may be placed at either end, to meet your individual requirements. The Burrell Simplex Spray Pasteurizer is readily adaptable to any milk plant arrangement.



The Burrell Simplex Spray Pasteurizer

Low bacteria counts and deep cream lines—they're what you want! You can have them.

In a large eastern city, the Board of Health reports indicate 75% lower bacteria count for the spray pasteurizer than for any other type of pasteurizer. These low bacteria counts are the direct result of the simple construction of the spray pasteurizer, and the ease with which it is cleaned.

The deep cream line results from the rapidity with which the milk is brought to the *pasteurizing temperature.* This quick heating is accomplished by three factors: (1) Large volume of *low temperature* water sprayed against the inner vat walls; (2) efficient agitation of the milk; and (3) the large proportion of heating surface to the volume of milk.

You will find the Burrell Spray Pasteurizer the answer to your bacteria count and cream line problems. Study carefully the illustrations and explanations at the left. Then consult our engineers in regard to further details—no obligation. Illustrated catalog, fully describing this tremendous improvement in pasteurizers, will be sent gladly upon request.

of that vitamine does lead to a peculiar hide disease in human beings in verious parts of the world, especially Japan and Manchuria, India.

What at first appeared to be a laboratory curiosity in the way of a research, when we produced this nutrition disease in experimental rats, turned out to be the production experimentally of a condition which has long been a human problem in certain parts of the world.

There is a second vitamine, the deficiency of which has been a problem of human health and especially in the Orient, some parts of the tropics, for certainly two thousand or more years, and that is the deficiency due to deficiency of vitamine B. It happens that this substance is abundant in milk, as vitamine A is abundnat in the fat.

We also came to learn a little later that there is a third vitamine, which we call vitamine C, and that is of particular significance because for a certain number of years, owing to the fact that we didn't understand about the existence of this substance—in fact, it is easily destroyed by heat—the subjects fed with heated milk developed scurvy. We now know that it is the wise policy to give every infant a certain amount of vegetable and fruit juice, when fed heated milk, to put back that one thing that is lost. We don't discredit bacteriazation because milk in heating loses this one property. We put back the thing which is lost, because pasteurization is necessary to save them.

There is still another vitamine called vitamine D which is so profoundly important in directing processes of bone development that perhaps the discovery of the vitamine D and its relation to rickets four years ago last August was the most important contribution to child health in America of all the nutrition researches that have been brought about for the reason that certainly half of all the children in the northern half of the United States have had at some time in infancy or childhood at least a mild grade of rickets. That will disappear in the course of a few years, or essentially disappear. There will be a few cases, probably. Scurvy has disappeared as a result of educational work in the last six or seven years. They haven't been able to find a case to show the medical students in the city of Baltimore with 800,000 people in the last two or three years.

The fact that there is a special vitamine that is so essential, so indispensable to proper bone formation, and that this substance, while present in milk in small amounts, is not in there in sufficient abundance but what we need one of two things to piece out that shortage—that is, we need either to give the child something which will provide more of the vitamine D than he gets in his milk supply or we must give him what we now know to be a substitute for this vitamine or something which enables him to make it himself; namely, sunlight. That is, we insist now that every baby should be given as a routine measure, not as medicine but to supply a dietary principal which is indispensable, a certain amount of codliver oil. Give it to them as a routine measure in every case because that insures him, if we are reasonably well endowed with physical vitality at birth, nutrition.

Another way in which you can prevent rickets is to expose the child to sunlight, because the ultra-violet rays of the sunshine on the skin forms, we now believe, in the skin this substance, vitamine D, which is found in the milk fat to a certain extent but not sufficient to protect the child against the rickets where it is born in the fall, kept heavily clothed throughout the winter months, very little open air or sunshine. Exercise is not promoted by the habits of life of a young child in winter; under such circumstances he must have mo
mine D than he gets in milk fat.

Many a child with hygienic conditions of liv
gotten through and developed a fine skeleton on v
D contents of milk, especially on that of milk wh
produced by cows on the right kind of food sup
course the best kind of food supply is summer

Sunlight, or the short rays in sunlight, is i
measure an effective substitute for codliver oil,
find no rickets in children who live in the warm
of the world where they have little clothing an
sunlight. I am mentioning this because it is im
to give you a complete picture, to show you we
to get up and talk about one thing and set it a
other things and laud it extensively but we wan
derstand the story, we want to understand the
which modern research and nutrition has bro
light and then tell the truth about it.

More recently we have had another vitamine
as a result of the investigations of Dr. Evans
Bishop at the University of California. Here a
have a substance present in milk fat but i
amounts, in too small amounts in ordinary sam
milk fat, to supply the optimal or favorable am
that substance. It is a great discovery. The who
of knowledge regarding what we must have to
adequate diet and what happens to us when one
other thing which we need is lacking, is presen
sufficient amount.

One of the most significant things to consider
nection with the human diet is the lack of calci
1918 I characterized a typical American diet as
sisting of white bread and meats of the musc
potatoes and sugar, and that is true today in so
less measure than it was five or six or eight ye
but still true to a great extent.

Within a year one of the girls in my laborato
down to the Y. W. C. A. in Baltimore to take n
the trays which the girls purchased there for the
ing meal. These girls were girls employed in b
many of them youthful enough so that they go ou
a good deal, come home late enough so that the
get enough sleep, they are so sleepy they can't
in time to have leisure for breakfast in time to d
get to work. Many a time they cut short their
fast or eat an entirely inadequate breakfast f
standpoint of quality. They go to the city to b

Large numbers of these girls eat an inadequa
—a sandwich and a cup of coffee or something
able to that. The evening meal in most cases
women is the substantial meal of the day. A
number of girls who intend to stay in the city
evening go over to the Y. W. C. A. cafeteria f
best meal of the day and yet, as this young woma
there and audited a hundred trays of the girls w
by, it was the same old story I told about eig
ago: Probably 90 per cent of the food on tho
was derived from a refined cereal flour or mea
muscle type of meat, from potatoes or other tube
vegetable, and from sugar.

You may be interested to know that from
which recently appeared from the Food Researc
tute of Stanford University, Dr. Alsperg, former
chemist of the department of agriculture, one
directors, it is shown that the sugar consumptio
going up. They passed 100 pounds per person
something like seven or eight or nine years ag
around 112 pounds, as I recall from looking at th
a week ago. That is approximately a quarter of

gar per person per day throughout the year and ne in the United States.

gar is a substance that has only an energy value. is nothing in the way of food elements in it except ource of heat and mechanical work, nothing struc- no vitamines, no mineral salts. It constitutes ap- nately a fifth of the total food supply of a great individuals. Because it lacks these substances are indispensable to health, it dilutes the rest of et in an amount corresponding to how much sugar en. As a nation we are eating too much sugar.

a nation we are eating a very large amount of re- ereals. I haven't seen fit to condemn that practice se it is possible to utilize foods that are in them- incomplete in various ways, provided we put with such things as will make good their deficiencies. are only two kinds of food which you can say heartedly and unreservedly meet those require- One of them is milk. That is the most acceptable. her is the leafy type of vegetable.

for years now I save been insisting that those two are our protective foods and should be increased eased beyond even those who are now paying at- n to the planning of the daily menu so as to pro- verything we ought to have, and in the case of a arge portion of population there is especial need nphasizing the inclusion of these two protective in the diet.

, as a nation, never have learned to eat any appre- amounts of leafy vegetables. There are Orientals o so. We are likely to adopt that practice very y, but the consumption of dairy products falls into line with our established dietary practices. e these things and there is nothing radical in mak- increase in the consumption of this class of foods. t we are a nation of enormous agricultural re- s and that means something very definite in the of how the nation is going to be fed. We have h agricultural produce and so little foreign mar- most of it that the problem of salesmanship enters e success in any line of food industry as one of the we must include, and as an industry you take less age of what you have to sell than anybody else selling food products.

k at the magazines and see the expensive space is constantly being utilized to sell the public sub- s for your product, and consider whether they to put this idea over as they are doing. There is systematic effort being made constantly to place the women of the country recipes for preparing ive, palatable dishes, using substitutes for dairy ts where the dairy products have qualities which us to say unqualifiedly that there are no effective utes for them.

at does that mean to you? Are you going to allow uation to develop any further than it has? Ten r 15 years ago there was no room for discrimina- tween one food product and another, as is the present today, but as it became widely known tter and milk and other dairy products of unique alues, and as you began to inherit the results of ntific writings of a number of investigators who ade this story of nutrition in the last 15 years, lic was listening to a certain extent—the intelli- rtion of it listens—and those who had products in the light of modern research, they couldn't talk ecause they had no selling points, have done other have presented half truths, have befogged the view in various ways, have used catchy phrases, l pictures, constantly holding names and expressions before the little educated. They are selling their products.

Dr. Larson told me recently that in per capita consumption (I think I'm right on this) butter has already started down. In recent times it is not even holding its own. Skillful advertising can undermine you completely if you don't so manage your affairs and employ methods which will keep your own product before the public in the most effective way; you will fail to maintain your business on a basis where it belongs.

You have a wonderful opportunity here and I needn't dwell upon it more than to just emphasize the soundness of what Mr. Munn said about talking, not about a single product, but the place of milk products in a health program. The story of what constitutes a satisfactory diet, the story of the elements of strength and shortcomings of this and that food, what combinations make for success and what for failure, education of the public to an appreciation of what they may expect in the matter, for example, of improvement in the quality of the health, and freedom (relatively) from dental disease if we bring up the next generation of children to develop a sound set of teeth instead of developing a defective set of teeth as has been the rule in the past, if you tell them such a story as this, you are presenting something of real educational value.

I have heard a number of prominent educators say in the last few years that we have been teaching children everything except how to live, and they appreciate pretty generally that it is time to begin to tell a child and over and over again, passing from one grade to another, in language that is suited to his stage of progress, how to live so this series of health rules which every child should become familiar with and are becoming more or less familiar with now though never heard of a few years ago.

The unique opportunity of presenting your product which has such outstanding nutritive qualities compared to any other food, in its proper place in a little story about how to live,—why, nothing of the kind ever was the heritage of any industry before!

You have an industry that sold four billion dollars worth of products in a year, and spent $150,000 in some sort of work to promote the industry; it looks as if you hadn't taken advantage of your opportunities. You can depend upon it that your competitors, with products which are inferior to yours, inferior from the standpoint of promoting the health of the nation, are studying their problem very carefully and there are several things which you need to do.

One of them is to extend the type of work done by the Dairy Council. Another is to try to reach, as time goes by, by somewhat different methods, the professional groups, especially the physicians and dentists and nurses, so that these people who are sources of information to others will understand the facts.

There is a great deal of confusion, misunderstanding, misinformation now in the minds of large numbers of people because there are those who are systematically befogging the issue. If you let them do that, not only does your business suffer but the cause which we in the field of nutrition feel is a very important one will fail to have the backing, the promotion which it deserves.

You've got to have leadership in order to manage the situation as it should be managed and there is evidence coming to me constantly that these professional groups have gotten less information, less education in the matter of what constitutes progress in research in the last 15 years than have the children in the public schools. It is not taught in any medical schools or dental school. Nurses' courses give only the slightest attention to this aspect of the subject. It is a nutritional problem. It's a thing still waiting to be done.

It is not to be done in just the same way that you approach the problem of education in the school, and for obvious reasons, but there are ways to do it and these key individuals in society should have not a fragment of information, not a few words extolling what you have to sell, but they should have presented to them in an easily understandable form that doesn't take much time to get, this body of knowledge or the principal results of it, which is the outsome of such a vast amount of research in the last 15 years.

This you should make your business because you are not only selling a product but with that you are selling health to the nation. No other industry has the opportunity that you have. I hope that you can see your situation and get behind a constructive program.

I am not here to undertake at this time to discuss with you the details of such a program. It would be out of place here. That is for a small group of people who have special knowledge in various fields to thresh out in a careful way and present to you as a larger body. But one thing you must accept in principle and that is that if any considerable number of branches of the industry sit back and wait for the other people who are interested in the sale of dairy products to finance the program which ought to be financed, then it will be a weak and relatively fruitless effort.

You should all bear your burden and count upon results and the growth of your business as you carry this education to the public. I have talked about this now so many times it seems to me the story must be familiar to all of you. Yet Mr. Taft said some years ago that the only way to get any idea across was to repeat and repeat and repeat. That appears to be the case. For that reason I am here again today to talk to you much the same sort of thing that I said seven or eight years ago, have been saying so many times.

You have profited a great deal without any systematic and effective effort on your own part, but the time has come now when I think you will slip back unless you understand what the situation is and plan to carry out a program which will accomplish what you want to accomplish, what you have a right to accomplish and what the public has a right to expect from you.

BREAKAGE OF BOTTLES IN MILK PLANTS.

The following table includes results from studies of bottle breakage at milk plants as shown in the November letter, with some additional data. The following observations have been made from studying the equipment and its arrangement in connection with the breakage of bottles in plants.

The pitch of spiral gravity conveyors is very important. In one plant the spiral conveyor was so steep and the jolting and jamming of the cases so severe that small jars frequently jumped and hung partly out of the cases. The breakage of glass is influenced by the distance the bottles travel and the amount of handling necessary. When bottles must travel a long distance from the checking-in platform to the storage room, a conveyor system, which reduces the amount of handling, will keep the breakage at a lower figure. Conveyors, however, must be kept well lubricated and in good order to prevent excessive jolting and bumping of cases.

When thermometers are allowed to get out of order, bottles are frequently cracked in the washer by being subjected to too great variations in temperature. Chipping of bottles on the routes also presents a problem. In one plant it was found that out of t number of chipped bottles about 90 per cent from the routes and 10 per cent were taken out a ent points in the plant. The total breakage in th (No. 14) was comparatively low, however, becaus well arranged conveyor system.

Wherever the arrangement of the plant re large amount of handling of cases, more than care on the part of employees is necessary to k breakage down. Plants 7 and 12 required a larger of handling of bottles from the time they were in until they reached the washers, and this res the high breakage at the receiving platform an feed end of the washer. Most of the handling plants was done with dolly trucks.

Moving bottles from one story to another breakage. The high breakage in two plants was uted to this cause; in one plant the bottles trav tween three different stories.

One plant using a case washer did not have s space to cool the bottles slowly by air but passe under sprays of water of different temperature breaking of many of the bottles at the fillers in that they had been cracked in the washing or operation.

Worn bearings on gravity conveyors make the uneven and cause the cases to jamb and jolt, c the bottles. This was the condition of the equ found at plant 13. The shape and arrangement storage room were such that considerable handli required to store the cases and to move them o gravity conveyors both in and out of the storag There was also high breakage at the discharge the washer, which suggests attention to that and its operation.

Breakage of Bottles in 14 Milk Plants.

Plant number	Number of bottles filled daily	No. lbs. broken glass per 1,000 bottle At receiving platform (includes route breakage)	At feed end of washers	At discharge end of washers	At fillers	In milk storage room (includes checking out routes)

Like a Chip of Spruce

Here's the Reason for the Toughness of a Sealright Cap —It's the Fulton Board

"TOUGH AS A WEATHERED SPRUCE" tells the story of Fulton Board and explains the rugged toughness of Sealright Caps, which are made of Fulton Board.

Time dried and scientifically waxed by a special process (which assures perfect sterilization), Sealright Caps are absolutely weatherproof. They never become "soggy" or "leathery" under ice or moisture.

Uniform thickness and clean cut edges insure perfect operation in capping machines. They fit the cap seat snugly, giving a perfect, liquid-tight seat in bottles. Printed from clean electros made at the plant, Sealright Caps are clear, bright and attractive. And there is a Sealright for every need. (See illustrations at left.)

In addition, Sealright Caps are nationally advertised and nationally known. Milk users everywhere prefer them. It pays to use Sealrights and to be identified with a nationally preferred service. Write today for Free samples of the three greatest caps in the dairy industry.

THE old idea that heavy snows and badly drifted streets would put an electric truck "on the shelf" as a delivery vehicle is rapidly passing.

Electric trucks can negotiate the most difficult traffic conditions and will pull through when most other types of vehicle are completely at the mercy of a snow blockade.

This change has been largely due to the Edison Battery. And for this reason: Edison Batteries have the inherent capacity for normal overload and heavy going *without in any way shortening their life.*

The nickel-iron-alkaline principle is entirely responsible. With the Edison Battery, temporary overloading and high discharge rates have no permanent effect on the plates. There can be no buckling, disintegration or dangerous overheating—hence—unimpaired life and entire freedom from winter battery maintenance troubles and rapid depreciation in capacity.

As a result, more and more transportation officials, even in the coldest territories, are turning to Edison Batteries as the answer to winter traffic conditions. Write for some interesting cold weather battery facts.

What Are Profits and Losses?

A Bank Book Will Not Give an Accurate Report of Costs. Necessity of Cost Accounting System

A PROMINENT advertiser says: "Many men have the eye-sight of a hawk and the vision of a clam."

That was not said of men in the milk business but—

We don't want it said of us, do we, men? Well there isn't much chance, because a genuine movement is on in the milk distributing business, and has been on for several years, to get this business on a real, sound, economic basis.

A good start has been made, but there is still much to be done along the line of keeping a proper record of costs. Knowing costs the milk dealer can outline his selling policies in safety. Without such knowledge he not only risks doing business without profits, but he also runs the risk of losing all that he has invested.

Some milk dealers are pegging along year after year fighting for business and wondering why their balance in the bank doesn't show up better. They just don't know what it costs them to do business, that's all.

Why such men have been loath to install a good cost accounting system is hard to determine. Perhaps it is due to the type of men employed as bookkeepers. Some of these men do not have adequate knowledge of the milk business, or else they are unable to devise a system that will fit their particular plant; for it is agreed that although the fundamentals are alike, and can be applied to all plants, a uniform system that is alike in every detail which will fit every plant, has not been devised—and will not be devised. However, the great reason why such systems do not predominate is perhaps due to the fact that the majority of the milk plants grew up from acorns, so to speak, and the operators of these plants cannot conceive why their methods of keeping records which they installed ten or fifteen years ago, when their plant was small, is not "good enough" for their present needs. They "guess they can get along all right," their business has been successful so far, so why should they change their methods. At the same time they will change their machinery and equipment to keep pace with their competitors, but they will not change a very important part of their business, even though a competitor has just as much chance of "whipping" him by the use of cost account system as he has by using modern equipment.

A workable system of cost accounting marked the good business man ten years ago. Today, it has become important that every business employ such a system if they are to realize the maximum profits and if they intend to remain in business. Margins between costs and selling price are narrowing each year, and in order to determine the profitableness, it is imperative that an accurate check be kept on all costs—costs of raw material, depreciation, labor, manufacturing costs and other items of expense incurred in the operations of preparing the product for the market. If such a practice is not followed, there is but little opportunity to study costs, so that they can be shaved from time to time, and thus meet competition.

Keeping Products Separate.

With the growing practice for many milk dealers to include in their manufacturing operations, in order to
utilize space and labor to the greatest extent,
coming increasingly important in such cases t
system of cost accounting. He should know the
producing each product in order to arrive at hi
price, and such is almost an impossibility if he
use a system that will give him a photograph
production costs. By means of a system of cost
ing he can, at all times, be informed of his p
losses.

It is just as important to the small manufac
to the one operating on a large scale, for the sma
has to operate on approximately the same margi
larger plant, and losses, however small and se
insignificant, are apt to result in his destructic
often, the only record that such a plant has of i
ings is its bank statement, and the only metho
of judging profits is by the balance after the e
that have been paid. If the balance at the en
year is larger than the one for the preceding y
conclusion is reached that their profits were
No account is, seemingly, taken that the quant
value of goods on hand may be greatly reduc
the preceding year, that the uncollected accou
have been reduced or a dozen other factors, that
into account, would not show the profits that ar
by a bank balance.

Contrary to the popular belief among those
not employing a system of cost accounting, a
counting system does not incur a stupendous am
work. Neither is it expensive to install and
when such a system will return a profit, it ca
classed as an expense. It is true, that some syst
too elaborate and do go into much worthless de
this is unnecessary; for if a system will give
figures on costs of materials and labor over a p
a month, if it will show the costs of operations, d
tion, interest, distribution and the other major p
the operation of a milk plant, accurate data ca
tained that will give a close check of the busin
give information to the milk dealer as to whe
earnings are all that are to be desired. Until t
dealer puts his business on such a basis, he is n
ing on a foundation of stability.

Twenty-Five Years of Dairy Accounting Experience is behind—

GREENHALGH Accounting *and* Cost System

THE Greenhalgh Accounting and Cost System gives you positive internal check of all operations in commodities as well as cash. This System is individually fitted to your business, regardless of the extent of its activities, and is personally installed. It is *scientifically* correct in arriving at all costs and figures, and does not entail burdensome work or extra clerks. It is simple, thorough and easily understood.

One of the big features of the Greenhalgh Accounting and Cost System is the subsequent service, which includes a monthly bulletin showing comparative costs (without disclosing names) so that you can see just how your costs compare with the costs of other Companies.

Read what The French Bros.-Bauer Company says:

"We have in the past made several attempts through our own efforts and those of different professional accountants to arrive at true cost figures. Since these efforts did not bring out the results desired, we were naturally somewhat skeptical as to the possibility of attaining real costs in our line of business.

"We are satisfied and agreeably surprised with what you have accomplished. Your methods of applying volume and indirect costs such as selling, delivery and administration expense are entirely practical.

"The fact that you have developed all costs in detail on each and every product, without materially adding to our office or clerical expense, is a noteworthy feature of your work."

Write for complete information on how the Greenhalgh Accounting and Cost System will work in your plant, and what it will accomplish for you. Indicate whether you bottle milk, make ice cream, or manufacture butter and cheese.

Official Auditors for
National Dairy Association
National Dairy Council
American Ass'n of Creamery Butter Mfrs.

Power Transmission Proble
in Creamer
and Dair

By W. F. SCHAPHORST, M. E.
Member A. S. M. E., Member Houghton Research Staff
E. F. HOUGHTON & CO.
Philadelphia, Pa.

A Discussion of One of the Plant Operator's Most Important Questions

THE use of power is on the increase in creameries and dairies. Power is becoming more and more important. The time has therefore arrived when officials of creameries and dairies should give serious consideration to power transmission problems. Thus far such matters have run along in pretty much of a haphazard manner.

Naturally, the thoughts that are uppermost in the minds of producers of dairy products do not relate to power transmission efficiencies, belt selection, shaft pulley alignment, and such things. Nevertheless so much power is now being used in the average creamery and dairy that in many instances it will pay the responsible head to take a week off and devote it entirely to a study of the transmission problems of the establishment.

For instance, one prominent manufacturer of creamery and dairy machinery recently wrote this to me:

> We are always in favor of direct motor drive installations wherever we can sell the customer on the idea of the additional expense involved. We believe the direct motor drive is economical and for creameries and dairies it is by far the more sanitary drive. Wherever belt drive is installed it is invariably due to the first cost and where first cost is given the only consideration.

Few operators realize that electrical efficiency in creameries and dairies is seldom as high as 80 per cent as compared with a possible 95 per cent for belt drive. In fact, in carefully made tests by disinterested engineers belt tests have shown better than 98 per cent efficiency.

Now, in the face of this great advantage of the belt method over the electric method, what has the electric method to offer to make it preferable? It must overcome that 15 per cent handicap.

Besides there is the additional handicap of greater first cost for the electric method. That must be overcome also.

In the above quoted letter its author writes, "We believe the direct motor is economical." Mere "belief," though, is not enough. The creamery and dairy man should demand FACTS. It is true that in some installations direct drive is more economical than belt drive, but such drives are rare in these fields.

More Sanitary.

He also says,—"It is by far the more sanitary drive." Just why electric drive is more sanitary than belt drive I cannot understand. My dictionary says that "sanitary" means: "Designed to promote health." There is nothing unhealthy about belts and pulleys and there is nothing healthy about electric motors. If anything belts and pulleys stir the air and thereby promote better air circulation and better health. I know of one instance where the spokes of pulleys were intentionally shaped to serve like the blades of a fan to agitate the air
is a good plan for rooms that would otherwise
or stuffy.

Appearance.

It is true that electric drive "looks" better th
drive. That point is conceded. But, unfortunate
many users of power are guided by appearances
than by facts. There is nothing beautiful about a
shovel, for example. A man wielding a hand
"looks" much better, and for some purposes IS
but for a large excavating job we don't find eng
insisting on hand shoveling any more. The diff
between belt and electric drive is not so great as
between steam shoveling and human shoveling, bu
an important difference nevertheless.

In General.

Transmission through belts and shafting,
properly installed, is so much more efficient than e
transmission, and is in general so much more satisf
on creamery machinery, that it is worth while t
careful thought to this subject.

Because of the unquestioned improvements br
about in electrical transmission, the statement is
made that belt transmission is doomed in the cre
and dairy and elsewhere. But that statement is fa
the truth. The foremost electrical and mechanical

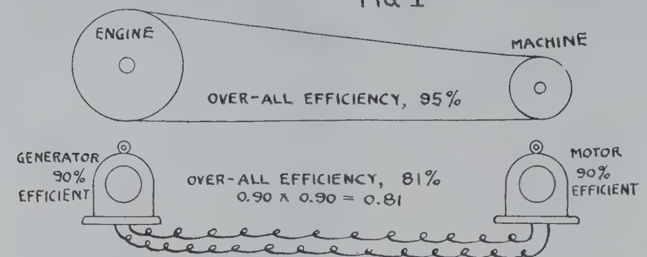
method is giving excellent results, so much so that most modern cement mills are now entirely individual drive. They are even eliminating intermediate mechanical speed reduction and are driving grinding mills by synchronous motors, either of the self-starting type or of the standard type with magnetic clutches.

Belts for Small Machines.

But in creameries and dairies individual motor drive is not always best. Nor may group driving always be best. And the same is true of exclusively mechanical transmission. There IS, always, a most economical method in every plant—often a combination of electric and belt drive. Sometimes individual motor driving will be found most profitable, sometimes all machines should be belt-driven, and sometimes group driving will be found to give best results. Nobody can state definitely which is best. Each special case requires treatment all its own. Prof. Norman, in his recent book "Principles of Machine Design" says:

> "On the whole, electric drive is less efficient than individual belt drive, although the power consumed by idling shafting is a very serious item in many cases."

FIG I



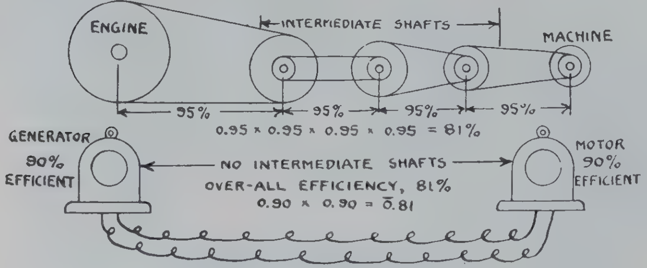


FIG 2

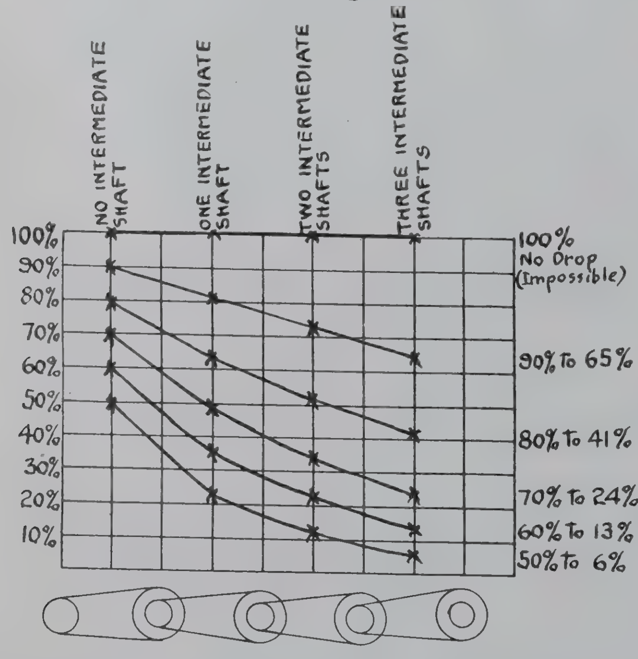
FIG 3



For churns, pasteurizers, separators, washers similar machines that require so little power, grou tric drive is usually preferable from the standpo power economy. Individual electric drive may " better, as already stated, but owing to the compara small amount of power consumed by most machi creameries and dairies and the low efficiencies of motors, it is usually found best to install only one motor on each floor, distributing the power from motor to all of the machines on that floor. The s

centage of load. It seldom pays to belt machines that are moved frequently.

2. Where the machines operate at full load steadily or most of the time, and where satisfactory belt drive is impossible.

3. Where speeds are too high for efficient or economical belt drive. Five thousand feet per minute is the generally accepted maximum speed for belts.

This is true not only of creameries and dairies but of nearly all industries. The portableness of the electric motor and the ease and safety with which it can be installed at any point in the plant has in numerous instances been the cause of radical changes in design and arrangement. But portableness has not yet altered creameries or dairies, and it is not likely that it will.

Where Machines Are Fixed.

Group drive driven from a common motor or from a line shaft is advantageous where machines are fixed. Most creamery machines are fixed.

Seldom if ever are two creameries or dairies exactly alike. Each individual plant must be analyzed thoroughly before a positive statement can be made as to which arrangement of drive will be most economical. It behooves the designing engineer to be open-minded and give consideration to every promising method, whether or not it is a so-called ''modern'' method. What the plant owner wants is—maximum income per dollar invested. Economical transmission will swell the income while expensive transmission will cause it to diminish. Thus, in some creameries it may be found advantageous to change to electric group drive in the distant portions of the building, but retaining mechanical transmission in those portions that are close to the source of power.

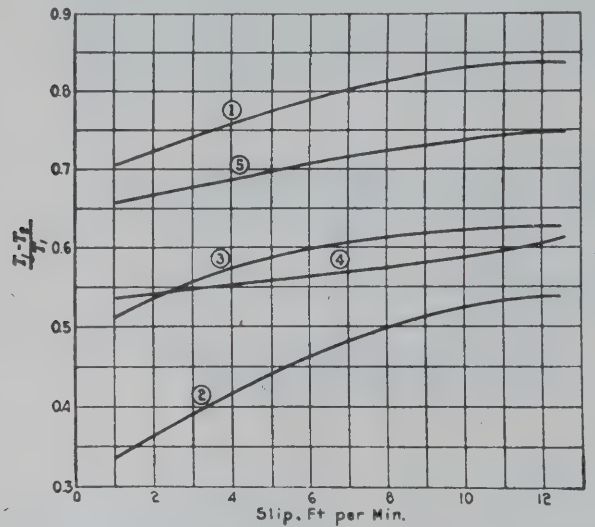

FIG. 6 RELATION OF SLIP TO FRACTION OF MAXIMUM BELT TENSION TURNED INTO EFFECTIVE PULL

(Curve 1, Special tanned leather; Curve 2, Oak-tanned leather; Curve 3, Rubber B; Curve 4, Impregnated fabric; Curve 5, Rubber A. For values of $T_2 - T_1 = 25$ lb. per inch of width.)

Before deciding upon electric motor vs. belt transmission on important drives it is usually worth while to investigate both efficiency and power factor. For instance, the efficiency of a 5 h. p., 3,600 r. p. m. motor is only about 65 per cent when operated at 30 per cent full load. Power factor, also, is low. This makes it expensive to drive a number of small motors. A single electric motor with belt distribution will give much higher efficiency and if properly belted will operate satisfactorily.

The question of fire hazard is shared about equally by the electrical and belt methods. Electric sparks and hot wires have both been causes of fires, but hot boxes
in shaft transmission and static from belts ha
caused fires.

There is no difference in quality or quantity
uct, whether the drive is electric or mechanical.
properly designed and installed, both do thei
well. The point is often made that machines t
individually driven produce more output but t
plies only to faulty drives.

Belt vs. Motor Efficiency.

Fig. 1 shows a comparison of belt drive ar
vidual drive where the belt to the machine i

HE FARRAR ADVERTISING COMPANY

108 FULTON BUILDING :: :: :: PITTSBURGH, PENNA.

When writing to THE FARRAR ADVERTISING COMPANY *please mention The Milk Dealer* ficiency and in addition there is the line loss. The overall efficiency of such a drive, then, Fig. 1, would be 0.90×0.90=0.81, or 81 per cent. The belt drive is, therefore, 14 per cent more efficient than the best electric drive.

It is true that a special case is used here, but let us go a little farther and carry the belt transmission problem to another extreme, as shown in Fig. 2, where three intermediate shafts lie between the engine and driven machine. This occurs as often in creameries and dairies as does the condition shown in Fig. 1. Assuming a belt efficiency of 95 per cent, as before, we find that the overall transmission efficiency is still just as high as with individual drive, for 0.95×0.95×0.95×0.95=0.81, approximately. Efficiency is now "nip and tuck" and the decision as to which to use would very likely lie with the first cost, convenience, dependability, etc.

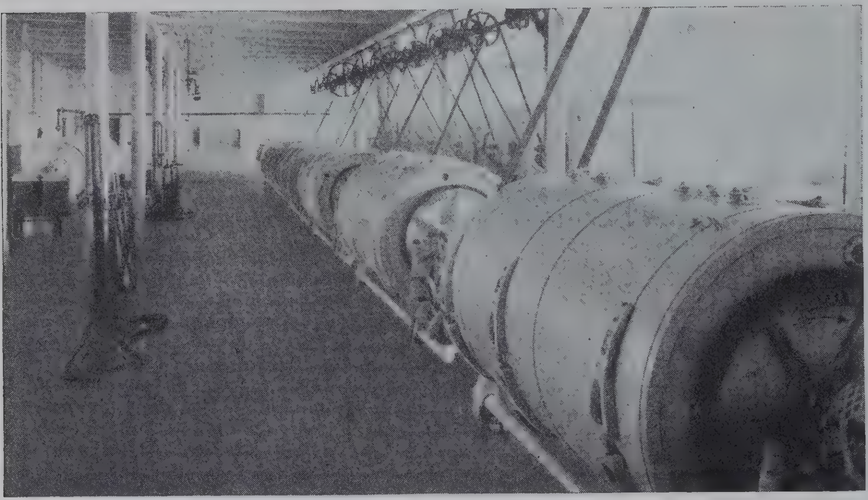

Fig. 9.
Eight churns in the Hanford Produce Co., Sioux City, Ia. Five horsepower is required to drive each churn—so small as to make individual electric drive more costly than belt drive. To be sure, belts must be non-slipping.

Inasmuch as the first cost of electrical apparatus is greater than mechanical, much depends upon whether or not the machinery to be driven is employed continually during the entire year or during only a portion of the year. The problem is very similar to the ball bearing problem—whether or not it will pay to equip certain machines or shafts with ball bearings. Where machines are seldom used, even though the transmission efficiency may be higher with individual drive, such a drive should not be used when first cost is great. This is true for the same reason that in some instances it is found economical in certain localities to burn 4 pounds of coal per hour to produce 1 horse-power instead of 1 pound of coal. It is now possible to produce even more than 1 horse-power per hour from 1 pound of coal, but the first cost of the process is too expensive for small plants. Much depends upon the cost of the coal.

Out of this we can conclude that the efficiency of a drive is not "everything." The thing wanted in the end is "maximum production per dollar invested," and this includes all factors such as labor, insurance, taxes, interest, upkeep, cost of safety appliances, etc.

Electrical Efficiencies.

Average efficiencies of generators and motors a
load are about as folows: Direct-current genera
50-kw. 90 per cent; 100-kw., 91 per cent; 1,000-k
per cent. Motors: ¾-h. p., 64 per cent; 5-h. p., 8
cent; 15-h. p., 84 per cent; 30-h. p., 90 per cent; 150
92 per cent. Alternating generators: 50-kva., 9
cent; 100-kva., 91.5 per cent; 500-kva., 94.5 per
1,000-kva. and over, 95 per cent; m
1-h. p., 76 per cent; 10-h. p., 85 per
100-h. p., 90 per cent; 200-h. p., 9
cent.

Thus, if we have a 50-kw. gen
whose efficiency is 90 per cent, and a
motor with an efficiency of 76 per cen
overall efficiency is 0.90×0.76, or 68.
cent. This efficiency is easily sur
with modern belts and pulleys und
dinary conditions, even without ball
ings.

An important point that should b
phasized is this: Always keep belt
in highly-efficient condition. Let us
pose, for example, that the efficien
each individual belting unit in Fig. 2
per cent instead of 95 per cent. Ordi
we regard even 90 per cent as high.
with such an efficiency, the overall effi
of the entire drive would be only 0.90
×0.90=0.655, or 65.5 per cent, which
tressingly low in comparison with 8
cent. This clearly demonstrates m
matically the importance of keeping belt drives effi

Fig. 3 shows graphically how rapidly efficiency

Cost of Electrical Burnouts.

Where motors are operated at full load continuously, or where they are overloaded, the danger of a burnout is ever present. Just recently some figures came into my possession concerning a factory in which nearly 5,000 electric motors are operated—the total power consumption being slightly over 40,000 h. p. To be exact the average of each motor is figured as 8.92 h. p. The statement shows that they average over 100 burnouts every year. The total cost of rewinding the motors is given, making it possible to figure that each burnout costs $83.80. To this cost of burnouts must be added the cost of holding up production, and the cost of idle labor during the breakdown period. In the average creamery or dairy which is not equipped for rewinding burned out motors the cost per burnout is very likely even greater than $83.80.

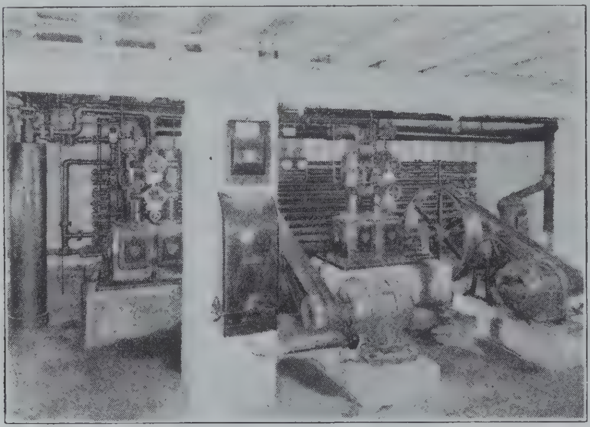

Fig. 11.

Two belt-driven refrigerating machines in the plant of the Purity Ice Cream Co., Newark, N. J. Each drive is equipped with a wrapper pulley. The first cost of units like this is much less, and the efficiency is usually higher than would be the case if direct-connected electric motors were used.

Motors Too Large.

A motor on a churn must be large enough not only to handle the average load but it must be able to handle the maximum or peak load. This is true of any machine, whether it is electrically or belt driven. Belt drives must also be so designed that they are capable of handling starting loads and other high loads as well as the average load. But to install an excessively large motor on each churn is not good engineering practice so long as something better is obtainable.

One can attach a tremendously large motor to almost any machine and it will "make the wheels go." But if the load is only intermittent, of a variable character, with a high peak, the load factor will be low and the cost of operation high. In a similar way it is possible to install needlessly large pulleys and belts, but the pulley and belt has an important advantage in the matter of load factor and power factor. An underloaded belt drive is usually much more efficient than underloaded electric drive.

Lubricants.

An argument often employed against belting is that belts become oil-soaked after which slip troubles occur. The best answer to that is:—employ lubricants that do not splatter. A splattering lubricant is usually more expensive on milk products than on belts and should not be tolerated. There are excellent lubricants on the market known as "absorbed oils," which are two oils in one—a film oil in which is absorbed the lubricating oil. The film prevents metal-to-metal contact and the oil supplies the lubricity or lubrication proper. Th
excellent oils for use in creameries and dairies fo
cating electric motors as well as line shafting.

Friction Clutches.

One of the former disadvantages of belt trans
was that in order to run a portion of a creamery o
it was customary to operate all of the line shaf
the idle portion of the plant as well as over the
that was loaded. This resulted in a serious
power. However, by judicious application of f
clutches, in accordance with modern methods, r
these losses may be eliminated. Electrical power
advantage in this respect. However, where the
is generated in the creamery itself and when th
is operating on light loads, the efficiency of the ge
is low. Clutches assist in avoiding the old f
countershaft drive, cross belts, tight and loose p
and extra bearings. They reduce first cost, reduc
requirements, make transmission still more efficie
reduce belt troubles to the minimum.

Belt Drive Simplicity.

The simplicity of belt driving is, of course,
in its favor. To the average dairy or creamery
there is so much mystery about electric motors th
purchaser is more or less helpless. Belts, pulley
shafts are so much simpler that any user can ma
own computations, write his own specifications,
his own installing.

Most creameries carry a supply of pulleys,
and hangers in stock. The first cost of these ma
being low, it is not expensive to keep them on
Then when a new machine is installed or a power

AMERICO" THE PASTEURIZER WITH A PURPOSE

h new "AMERICO" with improved coil control

The "AMERICO" embodies the most advanced principles in design and construction.

It has no stuffing boxes to gather bacteria and contaminate the batch.

The agitation is gentle. This prevents foaming, churning and breaking of fat globules.

Heating is done with water below 160° F. There is no burning on the coils nor scorching of the product.

The flush type outlet valve is standard on all vats.

Thorough cleaning of all parts is accomplished with ease as the coils can be raised out of the vat.

What an "AMERICO" User Says:

"We consider that 'AMERICO' is nearer perfection than any pasteurizer we have ever used."

ERICAN COPPER & BRASS WORKS
Manufacturers of Dairy Equipment

610-616 E. FRONT STREET
CINCINNATI, OHIO

stricted to a definite speed. If we want a different speed we are obliged to use a step-up or step-down belt arrangement. We must give consideration to the load characteristics. Does the machine start easily or with difficulty? The condition of the machinery, lubrication, kind of bearings, alignment, etc., must all be carefully weighed in order that the proper size motor will be selected. The motor must be capable of handling whatever load is required of it—peak load, or valley load, long sustained normal loads, short peak loads and innumerable small loads. If peaks or overloads are of too great duration the motor will heat excessively and may burn out. In some modern installations, to prevent overheating, the motors are artificially cooled.

Where old creameries and dairies are entirely belt operated with ordinary or plain bearings, overall transmission efficiency commonly varies from 60 to 70 per cent. Sixty-five per cent may be taken as the average. Such plants are far from being up-to-date. With the installation of ball or roller bearings on the important drives and with modern well lubricated plain bearings elsewhere, overall transmission efficiency should be no lower than 90 per cent. In other words, with all of the line shafting running and all machines thrown off, only 10 per cent of the engine horse-power should be consumed in operating the transmission machinery with all of the machines cut off.

The Best Belt.

Thus far nothing has been said about the kind or quality of belt that should be used in the dairy or creamery.

There is a vast difference in belts. The difference is greater than most belt users realize, and, owing to the all too common use of poor belts in creameries and dairies and their unsatisfactory performance we now find the electrical manufacturers taking advantage of the situation in an attempt to foist a more expensive type of drive upon the creamery and dairy owner.

The average creamery man does not know how to select the best belt. He looks askance at "belt data" and "belt tests" because he believes them to be biased; and, usually, he is right.

It is well known that tests conducted under the auspices of interested manufacturers for the sole purpose of obtaining favorable selling literature are often unreliable. No manufacturer can be blamed for desiring helpful data, of course. In fact, it is common practice to "buy" test data for such purposes, and to publish results that are obtained in the manufacturer's privately owned testing laboratory.

I do not know of a single instance where an engineer or other person employed solely to test a product has not endeavored to obtain favorable data for the manufacturer. Often the test results are twisted in such a way as to make them appear favorable without being untruthful. This may be done by simply omitting the unfavorable results and publishing the favorable side only. It is a very poor product indeed that does not possess a few commendable points, consequently all selling arguments are made to hinge around those few points.

Unfortunately, in the power transmission field so much of this biased literature is in circulation that creamery and dairy owners have much difficulty in deciding which belt is best without conducting tests of his own, and, of course, the expense of testing anything thoroughly is in most cases so great as to render that method uneconomical.

It is, therefore, refreshing to learn that entirely unbiased tests have recently been made on modern belts, comparing most of them, such as special miner
balata, cotton, combination chrome and oak
rubber, and oak tanned belting.

One of these unbiased tests was conducted
Ohio State University under the supervision o
C. A. Norman, professor of machine design. The
of the tests were presented by Prof. Norman bef
American Society of Mechanical Engineers in De
1925. The title of his paper was, "The Tensio
and Transmissive Power of Belts." In his ackno
ment he says, "All new belts used in these tes
bought from manufacturers without statement
purpose for which they were to be used."

Manufacturers of belting had no knowled
those tests were being conducted. Prof. Nor
ceives his salary from the University of Ohio fo
work of this nature and is not dependent upon
facturers. Manufacturers are generally willi
glad to furnish "free" belts for testing purpo
in this instance the belts were purchased in t
market where all best belts should be purchase
much biased belt information is based on data o
from the best belts that can be made. Data sh
based on "average" results in accordance wit
practice as in steel tests, wood tests, paper tests

Inasmuch as Prof. Norman's paper will be f
Mechanical Engineering, published by the A. S.
I am reproducing only three of the charts which
most interesting in the entire report.

It will be observed that the special mineral
leather belting gave best results in every test.
in Fig. 4 the top curve (curve 1) shows a "pu
ficiency for the special tanned leather belt varyi
73 to 92 per cent. The best that balata belting
is 85 per cent. The maximum for rubber is 70
and for solid woven cotton 63 per cent.

In Fig. 5 special mineral tanned belting is a
top, curve 1, while oak tanned leather shows poo
sults in curve 3. And in Fig. 6 the honors on
go to special mineral tan, rubber, solid woven
and oak respectively.

An important feature of Prof. Norman's test
fact that the belts tested were "new" belts. T
were NOT made on belts that had been carefull
in. It is obvious that a belt should be as able
full load when new as when used a number o
Thus, if 100-h. p. must be transmitted by a c
main drive is it not foolish to buy an extra-w
belt capable of transmitting that amount if a n
old one will do it better? Or, in other words, w
a new belt wide enough to transmit 100 h. p.,
after two weeks or so will transmit 200 h. p.? S
is better engineering to buy a belt that will t
100 h. p. from the beginning. Oak tanned
belting is at a disadvantage in this respect, fo
Norman says:

> "New oak-tanned leather belts, not run
> vert into effective pull a smaller fraction
> maximum tension. Rubber belts, balata be
> tain textile belts, and the special-mineral-tan
> give their full service from the very start."

Other unbiased tests were made in France
official scientific institution of world-wide re
and absolute dependability—the Laboratories
chanical, Physical and Chemical Tests for Test
chinery of the French Republic. The complete
known as Official Report No. 41426 of which tra

secretary of the State of Technical Instruction,''
is associated with the ''National Conservatory
Arts and Science.'' The tests were made in Par
the report came from the same city.

The purpose of the tests was to determine the
losses of a belt drive transmitting about 30 h.
speed of 4920 ft. per min., with regularly dec
tensions on the shafts.

Three leather belts were tested: First, a pa
belt of oak leather lined with chrome strips, refe
as the ''combination belt;'' second, a special
tanned leather belt; and third, an oak-tanned
belt.

All of the belts were tested on two polished ca
pulleys which were placed on two dynamos eq
with power measuring brakes called, ''electrical
mometers.'' One of the electrical dynamomete
used as a motor and the other as a brake. The
dynamo was placed on a platform which was so ar
that it could pivot about the axis of the shaft
through its iron pulley—similar to a gasoline eng
a brake-test block.

One of the dynamos was mounted on slide
that the belt tension could be increased or decrea
will.

Beginning with high tension and full load the
in the belt was gradually reduced until the belt
completely slip on the pulley.

Throughout the tests the rim velocity of the
pulley was maintained as closely at 4,920 ft. per
possible.

Each observation, or reading, was extended
period of four minutes.

Throughout these tests the special mineral
belt gave best results. At only one point did t
belt show a better result and that was but slightly
than the corresponding result for special mineral
belting.

Summing up, these tests showed that:

1. At a sliding speed of 0.98 ft. per min.
efficient of friction of the special mineral tanned
3.78 times that of oak belting. (0.70÷0.185=3.7

2. At a sliding speed of 59 ft. per min.
efficient of friction of the special mineral tanned
3.59 times that of oak. (1.97÷0.550=3.59).

3. The maximum coefficient of friction fou
oak belting throughout the entire range of expe
is not as great as the minimum coefficient of
found for the special mineral tanned belt. The mi
for mineral tan is given as 0.70 while the maxim
oak is given as 0.608.

4. Even where the mineral tan leather be
operated so loosely and slack that the upper side t
the lower side, the belt still pulled full load, wit
tically no more slip than when the belt tensio
normal.

5. Under the given conditions of the test
perimenters could not make the special mineral
leather belt slip more than 1.55 per cent. The ma
shown in the tables and curves is 1.4 per cent.
other hand the oak belt slipped 8 per cent.

6. The special mineral tanned belt is very
The tests show that when under maximum initi
sion there is no perceptible difference in total
mission losses between the special mineral tan a
In fact, one of the readings gives the oak an adv
of one-fiftieth of one per cent but that is the onl
ing the writer has been able to discover in the en
port that gives the oak any sort of advantage
maximum losses for oak mounted up to 8.8 p
while for special mineral tan they went no highe
very worst than 2.2 per cent.

The Deleterious Effect of Freezing on the Flavor a
Physical Properties of Milk[*]

By PROF. WM. H. E. REID,
COLUMBIA, MO.

Abstract—The freezing of milk containing flavors
than the desirable milk flavor, causes such flavors
come more pronounced. The cream column of froze
decreases in length in direct relation to the freezin
perature and the length of time frozen. The freezing
milk fat results in clumping of the globules. Many gl
when photographed, appear distorted in shape and ir
in their circumferences.

THE object of this study was to determine the effect of freezing on the flavor and several of the physical properties of milk. The intensification of many of the undesirable flavors and odors which are most prevalent in winter was thought to be caused by the freezing of the milk.

Milk is frequently frozen while on the delivery wagon or subsequent to delivery. The length of time the milk is frozen depends upon the hour of delivery and the time when the milk is received by the consumer. This time commonly varies from one to five hours. The intensity of the freezing is made greater or is lessened depending upon the severity of the weather.

Casein in milk is a nucleo-protein and contains phosphorus. It is insoluble in water when free and uncombined. In milk it is combined with calcium in form of dicalcium caseinate and is in suspension. Casein is responsible for the white color of milk and in part for its opacity. When milk is exposed to a low temperature, the calcium caseinate forms flakes, which, when the temperature is sufficiently low, are visible to the eye.

Fat is present in milk in extremely finely divided condition, i. e., in an emulsion. The evidence is strong that the milk fat is derived from the phosphatid of the blood plasma.

In freezing, milk undergoes profound physical changes which become more pronounced with the length of time frozen, and it may be partially churned, that is, the complete emulsion which previously existed may be partially destroyed. The natural emulsion of the milk fat is never completely restored after thawing and the casein then appears in form of white flakes rather than in the original colloidal condition. The fat content of the upper layers may be three times as high as originally and much higher in the center portion of the milk than at the periphery. The emulsion of fat is destroyed much more rapidly when frozen than is the colloidal condition of the casein. Milk which has been frozen will decompose much more rapidly than unfrozen milk because of the injurious physical changes resulting.

The upper layer of milk after freezing has a lower specific gravity than in the original milk due to the increased fat content, although the total solids may not have changed materially.

The changes which take place in milk when frozen are permanent and the milk when thawed is never exactly the same as the unfrozen milk. The freezing point of milk is below that of water. The lower freezing temperature of milk is due to the presence of solids in suspension and solution.

When milk freezes, the freezing process is not complete as the external evidence may indicate. The water of the milk freezes first and the solids form a highly concentrated solution with a depression of the freezing point. The water freezes first at the outside on the wall of the vessel containing the milk; the solids, i. e., the fat, casein, albumin, milk sugar, etc., are forced toward the center, giving a more concentrated solution, ar
freezes at a lower temperature. As the freezing
milk continues, the fat rises and is forced to the
The central part of the frozen milk has a much
specific gravity than the original milk, because
higher solids, and somewhat less fat.

Milk has a lower surface tension than water l
on account of the proteins. That the individu
globules are surrounded by a very thin film of p
has been proven analytically by the higher ni
content of cream and butter as compared with mil
protein films of the fat globules are not solid, b
cous and they cause a natural gathering of the
raw milk. These accumulations bring about the
gravitation of the fat and give the definite crear

Normal milk has a slight odor resembling t
halations from the cow's skin and a slightly sw
taste. During the colostral period and near the
lactation, cow's milk may have a salty, bitter, or
what rancid, animal-like taste. Milk of the indi
cow many also be salty or bitter in advanced lac
after abortion, in mastitis, and when the anima
gestion is disturbed. Milk with certain degrees o
ity will acquire a bitter, astringent taste in ruste
sels. A fishy taste is sometimes present when mil
sels are rusty or are not rinsed free of soap p
Many aromatic feeds impart a characteristic odo
taste to the milk, for example, ensilage, rape, ca
beets, turnips, rutabagas and carrots. Many undes
odors are readily absorbed by the milk, especia
a medium high temperature.

Many abnormal odors and tastes result fro
growth of bacteria in milk. Activity of pepti
bacteria may product a bitter taste due to prod
of peptone, and later a foul and unpleasant odo
taste, the result of decomposition processes. Bac
the coli-aerogenous group produce an unclean,
nauseating, stable or manure-like odor and taste.
eral organisms have been identified which produ
ter, soapy, oily, and burnt tastes and a stable-lik
and taste.

The literature furnishes few researches treati
this problem.

DuClaux[1] reports frozen milk has a changed
but does not attempt to describe it, and says that
is not less cream in frozen milk. Farrington[2] foun
freezing milk causes it to separate into two d
parts, i. e., first milk crystals largely compress
water, with small admixtures of fat and serum
and second, liquid proteins containing nearly all
milk proper. Heineiman[3] states milk undergoes
ical and physical changes which are more pron
the longer it remains frozen, and that thawed milk
returns to its original state.

The flavors studied are those which are foun
or less frequently in market milk. They are:
water, fly dope, ragweed, silage, alfalfa, molasses,

animal heat, woody, oily, gasoline, metallic, and feces. These flavors were prepared in the following way: The wash water was obtained direct from a vat in which milk bottles had been previously washed; the fly dope used was a commercial product; ragweed, ensilage, alfalfa, and onions were obtained from the original plant; and the woody flavor from pine shavings. The metallic solution was obtained by immersing metal shavings. A solution from each was sterilized to destroy all life and to prevent developments in the milk of an off-flavor from some other source. Ordinary oil and gasoline were used as gasoline is sometimes transported in milk cans and the oil may come from the separator, or other sources. The animal heat and feces flavors were readily obtained by exposing the milk in open pails for a brief time in the barn proper.

The procedure followed in determining the relation of freezing to the intensification of these off-flavors was as follows: Fresh whole milk was received and judged to observe that it was free from undesirable flavors. This milk was then standardized to test 3.7 per cent butterfat, to give assurance that no differences in our observations could be attributed to the difference in the butterfat content. A skim milk free from undesirable flavors was used in standardizing the whole milk. The milk when found satisfactory was divided and equal amounts placed in sterilized glass vessels, each having a known capacity. The glass containers were then marked as follows: Check samples of original milk not to be frozen; check samples containing known flavor not to be frozen; samples containing flavor to be frozen and thawed at 45 degrees F. (7.22 degrees C.), 60 degrees F. (15.55 degrees C.), 75 degrees F. (23.89 degrees C.), 90 degrees F. (32.22 degrees C.). All determinations were made in duplicate. The containers were stoppered to prevent the volatilization of any flavors. The various temperatures were used to determine if they might increase or lessen the intensification of the off-flavors due to the variance in the time that might be required to thaw the respective samples.

The amount of each flavor under study added to the measured samples of milk, with the exception of the checks, was just sufficient to give the milk a flavor perceptible to the taste. The samples were then frozen at a constant temperature of 10 degrees F. (—12.22 degrees C.) for a period of three hours, then they were thawed at the respective temperatures noted.

Effect of Freezing on the Cream Line of Milk.

To determine the effect of freezing on the cream line fresh samples of milk, testing 4.5 per cent butterfat, were obtained and cooled to 42 degrees F. (5.55 degrees C.). Ten calibrated 100 ml graduates were filled with milk to the 100 ml mark and allowed to remain quiet for 12 hours at 42 degrees F. (5.55 degrees C.) to permit gravitation of the milk fat. This length of time was required to assure the maximum creaming of the milk. Eight of the graduates containing the milk were then frozen at a constant temperature and for the desired length of time. Two graduates were retained at the cooling room temperature as controls. When the freezing process was complete the graduates were removed and held at a temperature of 60 degrees F. (15.55 degrees C.). Observations were made and the graduates photographed. Observations were again made after one, three and 24 hours respectively. Milk was frozen in the graduates for three and five hours at 0 degrees F. (—17.78 degrees C.), 6 degrees F. (—14.44 degrees C.), 10 degrees F. (—12.22 degrees C.), 15 degrees F. (—9.44 degrees C.), 20 degrees F. (—6.67 degrees C.), 25 degrees F. (—3.89 degrees C.), 30 degrees F. (—1.11 degrees C.). These periods of freezing and temperatures were decided upon as representative of comm ditions.

Table I—Effect of Freezing Milk at Varied Temperatu Different Periods of Time.

Temperature Frozen in Degrees	Frozen 3 hours			Frozen 5 h	
	Pct. loss after thawing			Pct. loss after	
	1 hr.	3 hr.	24 hr.	1 hr.	3 hr.
0°F.(—17.78°C.)	39.00	42.44	45.90	40.75	42.65
6°F.(—14.44°C.)	38.84	41.82	43.16	40.12	42.47

30°F.(— 1.11°C.)	.58	4.25	12.19	2.21	5.89

Discussion of Results.

When the milk samples to which no flavors h added and those containing the different flavo judged the intensity of the aroma and flavor condition of the body of the cream column w served. The data indicated that in every insta samples of the original milk which were not fro a clean, desirable aroma and flavor. The check of the original milk which had been frozen we from an unclean aroma and flavor, but possessed which was flat, due probably to the watery cond the samples, caused by the freezing and separatio liquid and solids of the milk. Samples contain different flavors, but which had not been frozen, show any perceptible change due to aging. The to which had been added the various flavors and had been frozen, had very pronounced and grea tensified aromas and flavors, common to, or typica particular flavor added. This was true of every frozen and then thawed at 45 degrees F. (7.22 C.), 60 degrees F. (15.55 degrees C.), 75 deg (23.89 degrees C.), 90 degrees F. (32.22 degre The intensity of the aroma and flavor imparted sample diminished with a lowering in the thawi peratures, the most pronounced aroma and flavo prevalent in the samples thawed at 90 degrees F. degrees C.) and the least pronounced in the thawed at 45 degrees F. (7.22 degrees C.).

The samples to which the wash water flavor ha added gave an aroma and flavor which was tallo characteristic of wash water; the samples contai dope caused a biting sensation on the tongue; r gave a flavor that was sickening and nauseating; the samples prepared from animal heat and fe resin flavor was obtained when a woody soluti been added to the milk. The flavor of gasoline, m filings, and oil produced flavors which were pron very undesirable and offensive.

The intensification of the undesirable arom flavors in the frozen milk may be explained by th able volatilization of some slightly volatile fats stances in the milk which had served as a buffer i ing the objectionable flavors not to become a when the milk was in an unfrozen state. This e tion is feasible in that milk having a very desirabl before freezing has a flat taste after having been The change in the flavor may also have been due, at least, to a precipitation of a part of the protei mineral constituents. The question of the solidity milk fat concerns itself in these deductions, inasm a fat in the milk at ordinary cooling room temp is only partially solidified. The partially solidif globules permit a partial volatilization, this be more apparent as the temperature is raised. T plains why milk when thawed at higher tempe imparts the several flavors with greater intensit did the same samples when thawed at lower te tures. The data appears conclusive that freezing

causes a decided intensification of any flavor which is present in milk at the time of freezing.

When the temperature is sufficiently low to cause freezing a separation of the solids results, the fat is forced to the center and protrudes above the neck of the bottle as the freezing continues. The pressure applied as a result of the freezing process partially destroys the emulsion of the milk fat. When the milk is exposed to a temperature above freezing, thawing occurs, and the ingredients of the milk endeavor to resume their original state. Observations made of the milk after thawing indicate that a physical change has taken place. The serum has changed from its original color to that of a bluish and watery appearance. The detrimental effect on the cream line is even more serious and is very apparent. When milk was frozen for a period of three hours at 0 degree F. (—17.78 degrees C.) and then allowed to thaw at 60 degrees F. (15.55 degrees C.) for one hour, the decrease in the length of the cream line, in comparison with the original, was 39 per cent; after standing at 60 degrees F. (15.55 degrees C.) for three hours the decrease was 42.44 per cent, and after setting twenty-four hours the loss was 45.90 per cent. The same milk frozen at 0 degree F. (—17.78 degrees C.) for five hours and thawed at 60 degrees F. (15.50 degrees C.) for one hour resulted in a diminishing of the cream line of 40.75 per cent; after three hours 42.65 per cent and after twenty-four hours 45.90 per cent.

The data in table one show that as the freezing temperatures were varied from 0 degree F. (—17.78 degrees C.), 6 degrees F. (14.44 degrees C.), 10 degrees F. (—12.22 degrees C.), 15 degrees F. (—9.44 degrees C.), 20 degrees F. (—6.67 degrees C.), 25 degrees F. (—3.89 degrees C.), 30 degrees F. (—1.11 degrees C.) the decrease in the length of the cream line in graduates thawed at 60 degrees F. (15.55 degrees C.) and observations made after one, three and twenty-four hours diminished with definite regularity with respect to the freezing temperatures and the time elapsing between observations. The same was true in the samples frozen for five hours at the same temperatures. The body of the cream of every sample frozen and thawed, when observed after one hour was granular, porous, and decidedly coarse. The upper and lower surface of the cream columns were irregular and ragged. As time elapsed these undesirable characteristics gradually disappeared. When the last observations were made after twenty hours the body in almost every sample was described as being quite smooth, free from the marked granular appearance, and the surfaces of the cream column regular and level except in the milk frozen at the extremely low temperatures, in which instances the effect of the fre
mained slightly apparent.

The decrease in the length of the cream colu
be explained in several ways. When the milk
jected to freezing temperatures, separation
takes place, the fat finding its way to the outer a
strata of the frozen column. The emulsion of t
partially or totally destroyed. Micro-photogra
that the fat has been disturbed and distorted,
result of the partial destruction of the emulsio
ing of the fat globules has taken place. The
of fat globules may also be made possible by
precipitation of the free casein or the precipit
the albumen which is then partially or almost
removed from the column of milk fat.

As a result of the removal of a part of the c
resistance which had been previously offered by
ence of the casein had been removed and the
globules were permitted to come closer togeth
ing them to occupy less space and to rise more
giving a decrease in the length of the cream colu
a lowering of the freezing temperature and inc
the length of freezing time. It seems reasonab
lieve that the precipitation of the casein may be
to be even greater, the groups or clumps of b
larger and more numerous. The clumps or g
butterfat globules may be dispersed in the seru
the fat column or even embedded in the pre
casein which no longer forms a part of the re
cream column.

Conclusions.

The freezing of milk with even a mild flavor
fies that flavor.

The freezing of the milk produced flavors whi
objectionable and oftentimes very offensive.

The intensification of undesirable flavors as
of freezing, is a menace to the market milk indu

The cream column of milk is diminished as
of freezing.

The decrease in the length of the cream col
comes greater as the freezing temperature is lowe
the time of freezing prolonged.

The body of the cream column during the first
hours after thawing is unsatisfactory, because of i
ular and porous appearance.

NO SUBSTITUTE FOR PURE MILK —NOR GLASS-LINED EQUIPMENT !

Ask any milk dealer the one outstanding necessity in his sales program—and he will tell you, ***a pure product!***

Sometimes he is not so clear on what is necessary at the production end of his business.

But the companies which are eminently successful and making money have a very clear-cut manufacturing policy.

They know that the hours they save in cleaning equipment, the comparative ease of operation of one type as against another, and the elimination of all slip-shod methods are the items which make up their profits.

Almost invariably you will find that such companies use glass-lined equipment.

Send for Catalog No. 673.

PREVENT LEAD POISONING WITH MILK.

(Continued from page 26)

I went down to the home of one of these men. I was very much interested in his case and I just wanted to see what he would have for dinner. I did not tell him I was coming. I managed to get there just as he was sitting down for his meal. The situation was pathetic. The home was pathetic. He had for his night meal nothing more than a large quantity of blackberry jam and cornbread, and he told me that was his particular diet during the blackberry season—that he found he could get along on that fairly well.

I am not going to elaborate this situation at all. I might give you perhaps dozens of examples of that sort of thing that is going on in a great variety of industries. Nor will I maintain that nutrition has everything to do with it, but I will maintain that in a great many of these situations there are outstanding nutritional problems.

All of which leads me to ask of you a number of questions. I don't know the answers to these questions nor do I believe that anyone has full information in reply to these questions I am asking myself and asking you.

What is the relation between improper feeding and factory production? Every manufacturer will be interested in an answer to that question. What is the relation between improper feeding and the currents of accidents? What is the relation between improper feeding and absenteeism? The relation between improper feeding and labor turnover? I know of one factory using a great deal of lead where deliberately they bring about a complete labor turnover every three weeks and when I try to figure it up the cost involved in that situation gets almost beyond my available figures.

What is the relation between improper feeding and the length of life of the industrial worker? I pointed out at the beginning that death rates in various decades during the work period show rates three times as high for the industrial worker as for a group such as you.

What is the relation between improper feeding and industrial fatigue? The relation between improper feeding and the production of specific occupational diseases, lead poisoning, mercury poisoning and a great variety of others? The relation between improper feeding and general plant morale? Between improper feeding and development of degenerative diseases? Between improper feeding and this thing we speak of as tiredness which is perhaps a thing apart from true industrial fatigue?

I might go on presenting a number of questions of that sort but it would be unprofitable at this time, although I do not know the answer to many of these questions. I want to say just one thing, to cite one single example of an experience in which the use of milk has been very valuable in controlling or appearing to cont currents of one occupational disease—lead poison

This has come about not through any effort o as far as I know in the proper extension of you ness, but has come about through the work of a ph who is interested in bettering the life of lead-expo dustrial workers.

More and more we are disposed to pay atten old-women notions that have held true for a lon All of us have pooh-poohed and some of us stil pooh the notion of the farmer that if he plants h in the dark of the moon he gets a better crop. Yo heard that all your life, yet just recently— within the last 18 months or 2 years—it has been thoroughly established on a scientific basis that farmer is exactly right, that there are very good for doing what he did; it has been shown that mo is polarized light and that many plants grow bet der the influence of polarized light and by planti crops in such a way that they would reach a certai of growth by the time of the next full moon, they get much better growth.

So I apologize to all of the farmers that have h notion which I have pooh-poohed myself.

The same way, for a long time a few people ha on telling us doctors that if you drink a little swe when you work with lead, you won't have lead ing. I have pooh-poohed that and now I am apol to all of those people who brought that to my at because now we have found that there are ve ceptable evidences showing that not only wi poisoning be prevented or controlled by milk but why and what happens.

Before I go into that, however, and explain s the details that are involved, I want to build up bit better background showing you what an in problem this is, how large it is to you and how it may concern you in your industry.

I have here in my hand a list of over 200 se trades, trade processes and industries that lead to hazard. I am not going to read that list, of cour I just pick out at random here two or three it order that you may reflect in your mind as to th ber of men or women probably involved.

Starting here at the very beginning, I find a flower makers, next come battery makers, down t I find linotypers and somewhere over 100 or 150 find toward the end white lead manufacturers a smelters, etc. Nobody knows, but somewhere neighborhood of three quarters of a million of dustrial workers are potentially exposed to lead ing.

You may come back at me and say, "Well, w it? They are exposed but we never see any lead

The Faultless Pasteurizer

BUILT on an entirely different principle. Designed to eliminate the human element in pasteurization.

℄ The absolutely automatic valveless operation makes this equipment a wonder for exactness. It is absolutely fool proof. The holding period is exact and the temperatures are easily maintained.

℄ Each compartment is distinctly separate from every other. Units can be had as low as 1000 pounds per hour and up to 50000 pounds per hour. This makes the Faultless Pasteurizer the right equipment for every dairy with an expanding business.

Our illustrated folder gives full details. Send for a copy.

ing. That is one of those rare things you doctors talk about. I've never seen a case and I don't believe anybody has this disease, and it isn't a problem that we need be concerned in."

So I have at hand a few figures that possibly will convince you that lead poisoning is a pretty common disease. These are not my own figures. I have borrowed them from Alice Hamilton, who has made extensive investigations.

First, a group of lead producing places like smelters and that sort of industry, employing in the aggregate about 3,000 workers. I find in one plant every year 18 per cent had lead poisoning; in another 18 per cent and a fraction, in another 27 per cent, in another 28 per cent, and in another 34 per cent and in another 52 per cent. In still another industry I find that on the average every person in the entire factory (this factory has 622 workers) has lead poisoning 2 and a fraction times per year. I myself have had one man who had lead poisoning 7 times in the course of a year and a half.

Without burdening you with too many figures, I still want to give you a few. From a storage battery factory I find an incident of 40 per cent of lead poisoning every year. And I find that in the pottery industry, which is very extensive in certain parts of our country, the rate is 23 per cent per year and among painters something like 40 per cent per year.

In short, the situation is that there are many industries having a lead hazard and in many of these the incident of lead poisoning is indeed high.

I want now to give you some idea of what lead poisoning looks like, the severity of it, with the idea that if anything can be done to prevent this disease, to lessen the severity of it, it will have your support in bringing this about. I am not going to tell you of just one case but a sort of mosaic case—the sort of things that come to my attention.

A man comes in, perhaps telling me that he is a lead worker and he can't eat. That is many times one of the very first manifestations. It usually starts with inability to eat breakfast, and as soon as he is unable to eat then his troubles begin to pile up. Shortly he will tell me that he has a queer taste in his mouth, that as he goes around it is as though he had a penny in his mouth. Then comes, about that time, a headache which bothers him a great deal, constipation becomes very severe, complicating his situation.

Then he begins to get weak in the muscles that he uses most, usually the right hand, and when he goes to shake hands with me or anyone else he has no grip and he tells me he can't any longer work because he can't pick up the tools. About that stage of the game it may be noticed that he is quite pale, he is anaemic, his blood is being destroyed. Those are the minor symptoms.

Then comes the severe pain, the lead colic w
about as severe a pain as I know anything about.
a man with such severe cramps that he rupture
vessels in both eyes. That, however, is an exce
situation. With a well developed case of that
many times comes about that a man loses from w
month, six weeks, two months and many times
seen three months' time absence away from w
cause of lead poisoning.

Now consider that situation and then contra
with what happens and has happened in my own
ence when lead workers are given general supe
in order to improve their condition, the control
lead hazard as much as possible, and then given
of milk per day. I have had a small group under o
tion now for some three years. The first year lead
ing was very high, the incident rate was very hig
it occurred to us from the work that was being
various places that perhaps we'd gain something
ing them milk, so it was arranged that the mana
was to make available every day a quart of m
every person who wanted it, who would take it, a
were encouraged to drink it.

For a period of about two years we had practi
lead poisoning at all. There were a few cases th
seemed suspicious and we treated them but the

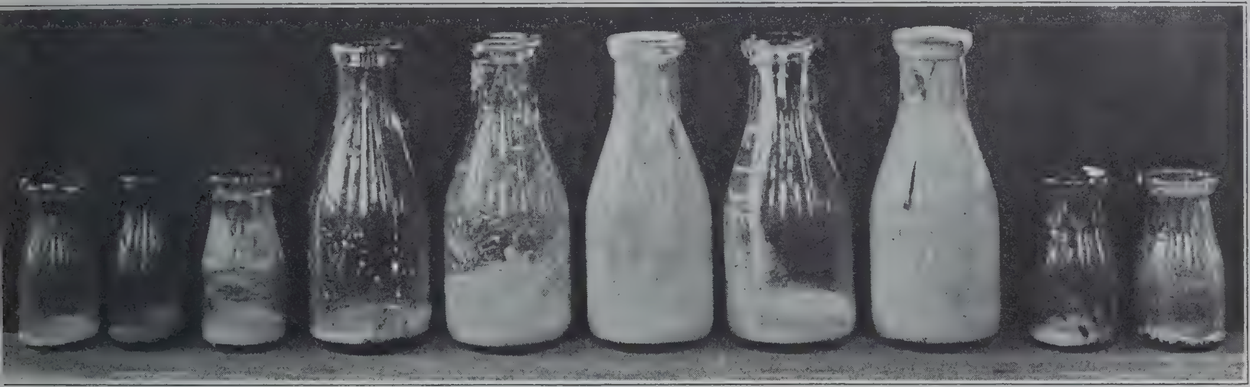
Wash Sink, Rinser and Sterilizer will do better work with less labor on account of its patented automatic features.

3-Brush Belt Washer

Write for Circular

? - ? - ? - ? - ?

Here is a photo of several milk bottles as they came back to the dairy. Thousands of bottles like these, containing sour milk, butterfats, dirts, etc., which will not drain out by gravity, are returned to every dairy daily. A record made for one day's run in a plant where approximately 15,000 bottles are washed per day showed that over 256 pounds of this dirt, refuse, etc., still remained in the bottles when they were fed into the washing machine. Tests also showed that these substances could not be flushed from the bottles by merely giving them a light rinsing with hydrant water.



Do you think that these contaminating and objectionable deposits should be carried into he soaking tanks of the bottle washer and allowed to accumulate for weeks?

Under such conditions can an alkali solution continue to be a clean and sanitary washng medium?

Can such a solution maintain a uniform degree of alkali strength without continually dding large quantities of alkali to it?

Can a bottle containing a quantity of this dirt, butterfat, etc., receive the same chemcal treatment from the alkali solution as one that enters the solution free from these eposits?

We dare say that the unanimous answer to these questions is NO. Then why use bottle washers which operate under these very conditions?

The CLEVELAND BOTTLE WASHERS are the only machines that remove all eposits from the bottles before they enter he soaking compartments.

The CLEVELAND METHOD of treatng bottles not only means sanitary and fficient washing and sterilizing but also means a great savings in alkali, which amounts to hundreds of dollars per year.

The CLEVELAND BOTTLE WASHER insures you of the most modern, efficient, and economical method of washing and sterilizing bottles.

Built in all sizes and to meet every condition. *Write for full particulars.*

to the rapid deposition of lead in the bone and the tion of clinical manifestations.

That could be made into a rather complicated sion as to calcium metabolism, but I believe that be improper at this time and place. The fact is th calcium of milk is the best form of calcium that I anything about for this purpose.

Calcium lactate may be given in tablet fo powder form but in my experience the calcium i itself brings about the best results.

In order that I may challenge you to some i in this situation, I am reducing this to the ap that if all of our lead workers everywhere may be as much as a quart of milk per day, 75 per cent lead poisoning will disappear. I do not mean to sa that is the only thing that should be done. Every form of protection in the way of wet processes of ing down dust, or promoting general cleanlines keeping lead out of the body of course is essential, in addition to those other things milk is given poisoning will disappear, at least 75 per cent.

Now, just as this one piece of work, an isolate of work, establishes a definite need for the use o in a particular industry or related industries, j there are a variety of other industrial problems in we suspect that foods, including milk, will play siderable part in the prevention and control, but f we lack definite proof and we cannot say a grea about it.

It is believed that the intelligent investigation will so clarify the situation as to bring about exa in procedure. The solution of these industrial problems will first benefit the worker and I real speaking to you today in behalf of these twenty and a half million workers.

Secondly, such investigation will undeniably b the employer of these industrial workers. In the place, if it may be shown that a proper need exis better nutrition of the industrial worker and the sive use of particular food, such as milk, a new fi endeavor is then opened up for the producer of thes ticular foods.

I am commending this field, this unknown, this known, this unexplored field, to you as a place for investigation at your hands.

TYPES OF CHEESE IMPORTANT TO MILK DEALER.

(Continued from page 28)

cream cheese of best flavor can be made by the us fine quality of cream testing about 15 per cent This cream should be pasteurized and commercial s used to develop a mild acid flavor. Excessive fat in the whey during the period of drainage can be g reduced by homogenization of the cream prior to t dition of rennet and starter. A smooth textur usually be obtained if very low quantities of renn used and the curd is drained slowly at relativel temperatures. Some pressure on the curd is need remove sufficient water to have a firm-bodied c The finished cheese should have less than 50 per c water and about 40 per cent of fat.

"The quantity and quality of starter and rennet be carefully controlled to avoid granular or cr cheese by this method. It is also essential to contro peratures carefully to avoid texture and flavor de

"A new method was developed by the speaker attempt to improve the process and the finished c In brief this method consists of standardization of with dry skim milk to the composition desired finished cheese; namely, 40 to 45 per cent of fat, cent of solids not fat, and 45 to 50 per cent of This cream is then pasteurized and after cooling the salt and starter are added. The cream is homogenized to give it the desired body and textur then allowed to ripen. When the desired flavor tained the cheese is cooled and the process is comp By this process the flavor can be controlled to bett vantage, the time of making is lessened, drainage whey and fat losses are eliminated, and a smoother buttery cheese is obtained."

OHIO PRODUCERS GET SIXTY CENTS OF M DOLLAR.

According to figures compiled by the Ohio Producers' Association, 60 cents of the consumer' lar which goes for milk and butter is received b milk and cream producers of Ohio.

The report further shows that this year cons in Ohio cities will use 860,000,000 quarts of mi which they will pay about $103,000,000. In or provide that farmers of Ohio will produce 17,0 hundred weight of milk which will yield them a of approximately $52,000,000.

It is estimated that Ohio will consume 78,0 pounds of butter for which will be paid approxi $42,000,000. To produce this butter 16,000,000 hu weight of farm produced milk containing 64,0 pounds of butterfat is required. The producers butterfat will receive $30,000,000.

Seventy-two cents of the consumer's dollar is for butter; the farmer receives 51 cents of th sumer's dollar which is spent for milk.

The report further states that for the combine duction of 33 million hundred weight of milk th sumer will pay $145,00,000 and the farmer will r $82,000,000, which is 57 per cent of the consume penditure.

It is stated that the 33,000,000 hundred wei milk is not the total production of Ohio cows bu there are 32,000,000 hundred weight more which i in the production of ice cream, cheese, condense evaporated milk, and also used on the farms whe produced.

Kentucky Officials Urge Pasteurization

State Board of Health Will Inspect all Pasteurizing Plants and Grade Them According to Methods Employed. State Standard Milk Ordinance to be Used as a Guide

HEALTH officials of Kentucky are busy working out a plan to insure the sale of the highest possible quality of milk and milk products in all of the cities and towns of the state.

Inspectors from the Louisville City Health Department are now making a survey of the conditions of milk and cream production in the Louisville milk shed and are taking note of where these products are marketed. This survey is in final preparation for the enforcement of Louisville's new dairy products ordinance.

An application to ship milk into Louisville and a certificate of the tuberculin test of cattle are compulsory requirements for milk and cream for table consumption. February 12, 1927, is the last day of grace for the milk producers to comply with these regulations. After that date, prosecutions will be in order for non-observers.

In a letter to Secretary Ball of the Dairy Products Association of Kentucky, the directors of the state board of health and the state bureau of foods, drugs and hotels outlined the work to be carried out as follows:

"The state board of health, realizing the necessity of the protection of milk supplies of the public is second only to the necessity of protection of water supplies for communities, is of the opinion that properly pasteurized milk is the safest milk.

"Many towns have taken the position that the water supply is a public utility and therefore have taken steps to own and provide a safe water supply, and, if necessary, a filtration plant and chlorination facilities. The state board of health carefully inspects every public water supply in the state and has adopted the policy, for a number of years, of publishing in the report of the bureau of sanitary engineering, the list of public water supplies in the state with ratings of good, doubtful or bad.

"It is true that no town in Kentucky has yet taken any steps to provide a municipal milk supply but in many towns the greatest percentage of the milk supplied to that community is pasteurized milk, and since the state board of health believes that properly pasteurized milk is the safest milk, we wish to be in position to assist not only the public in knowing which milk is properly pasteurized, but also to assist pasteurizing plants in the very best possible position to produce a properly pasteurized milk.

"It is planned, in co-operation with the bureau of sanitary engineering of the state board of health, through its assistant engineers, to make inspections and publish grades of all pasteurizing plants in the state of Kentucky, including those located in cities which have not passed the standard milk ordinance, as well as those located in cities which have passed this ordinance.

"These inspections and grades will be made at least once during each year, and if possible, once every six months, and grades will be determined in accordance with the regulations and provisions of the United States Public Health Service Standard Milk Ordinance, which are the rules and regulations for the grading and inspection of dairies, passed by the state board of health. The proprietor of each pasteurizing plant will be given a copy of the inspection as it is filed with the state board of health, and a statement will be issued from the board as to the grade given on that inspection, with the date attached, and in case a grade 'A' is given to the pasteurizing plant, permission will be given for tha to make use of a statement that they are sellin pasteurized in a grade 'A' plant. However, per cannot be given for the sale of grade 'A' past milk to any plant unless the dairies supplying that plant conform in all particulars to those of the standard milk ordinance which deals w dairies, requiring at least a grade 'B' for all dair plying milk to a grade 'A' plant for the produc grade 'A' pasteurized milk.

"An inspection and grading shall be good for six months and if at any time inspection durin six months shows a violation of any requiremen grade 'A' pasteurizing plant, the state board of will reserve the right to degrade and notify the of the fact. The grades of all pasteurizing plan the date of grading, will be published in the yea port of the bureau of foods, drugs and hotels, ning with the report for the year 1927.

"The state board of health has assigned two as sanitary engineers for duty with the bureau of s engineering which is co-operating with the bur foods, drugs and hotels in the joint work with which have passed the United States Public Healt ice's Standard Milk Ordinance and in the genera of inspection of pasteurizing plants and surveys supplies of the cities of Kentucky.

"These engineers, Cyrus Layson, Jr., Henderso who will have charge of the inspections and sur the western part of the state, and E. E. Jacobso tioned at Louisville, Ky., will have charge of the tions and surveys in the eastern part of the sta the newly appointed engineers. These assistan neers work directly under F. C. Dugan, director bureau of sanitary engineering of the state bo health, and work in co-operation with L. C. Fran itary engineer in charge of the office of milk inspe the United States Public Health Service, static Montgomery, Ala., and with the bureau of foods and hotels.

"Copies of the standard milk ordinance, con the regulations for the grading of pasteurizing and dairies, will be sent on request to any paste plant by writing to the bureau of foods, drugs an of the state board of health.

"Any request for surveys, either by proprie pasteurizing plants or cities desiring surveys, come direct to the bureau of sanitary engineerin the bureau of foods, drugs and hotels."

FLORIDA UNDER-NOURISHED CHILDREN EFIT BY NEW PREPARED MILK.

The Pensacola Dairy Company of Pensacola, F providing lactic ferment milk, a body building c ent which is strongly endorsed by Drs. E. L. Re J. H. Fellows, local physicians.

In manufacturing the finished milk product, as lactic ferment milk, a culture is first inject milk in the amount given by the formula, and time forms what is known as cultural buttermilk

This lactic ferment milk is said to be equally cial for adults.

To Sea In a Tub

No sane man needs to be told of the folly of going to sea in a tub. He would turn, drift, and be the helpless victim of every wind and every wave that chanced to come along.

Yet many milk companies are trying to make progress in sales development with either no definite plan, or one that gets them nowhere.

The *Case Plan* is a high powered vehicle, which if properly used will drive any milk company to supremacy in its field.

The *Case Plan* will do the following for you:

(1) It will make a merchandising man of your sales manager;
(2) It will awaken the latent ambition in your delivery salesmen;
(3) It will provide a school for your salesmen;
(4) It will stimulate rivalry between every man in your sales organization:
(5) It will quickly sift the chaff from the wheat in your sales department;
(6) It will give your salesmen information they probably never will get without it;
(7) It will stop leaks and waste in your sales department that cost you many times its price.
(8) It will make you the envy of your competitors;
(9) It will make the year 1927 the happiest year since you have been in business, AND
(10) With the *Case Plan* you will *not* be putting "TO SEA IN A TUB!"

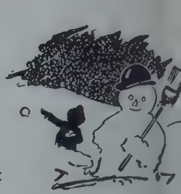
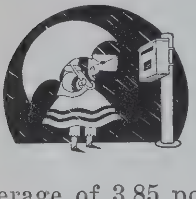
Experiments on Children Prove the Superior Value of Dairy Products in the Diet.

Extract from Annual Report of National and Regional Dairy Councils by
M. O. MAUGHAN, Secretary.



ONE of the most outstanding experiments on children ever conducted has recently been reported by the Medical Research Council of London, England. This authoritative organization made a prolonged study of a large group of boys (220) with an effort to determine the food value of various articles of the diet including milk and butter.



Sixty-one boys were given the basic diet. This basic diet satisfied the appetite of these growing boys and apparently was all that was needed. During the first year these boys increased in height 1.84 inches and gained an average of 3.85 pounds.

Another group of boys, 41 in number and as nearly like the group of boys fed the basic diet as possible, were fed a pint of milk a day in addition to the basic diet. These boys were carefully studied for a period of one year and their gain in height was 2.63 inches and their gain in weight 6.98 pounds, or in other words their increased gain in height, because of the milk, was 42 per cent and their increased gain in weight, because of the milk, was 81 per cent.

Another group of boys, 26 in number, were given 1.75 ounces of butter daily in addition to the basic diet. They increased in height 2.22 inches and gained an average of 6.30 pounds, or in other words, their increased gain in height, because of the butter, was 20 per cent, and their increased gain in weight, because of the butter was 63 per cent. Still another group consisting of 16 boys were fed vegetable margarine in addition to the basic diet. These boys increased in height 1.84 inches and gained an average of 5.21 pounds per boy during the 12 months, or in other words their increased gain in height because of the margarine was 0.00 per cent, and their increased gain in weight because of the margarine was 35 per cent.

Still another group of boys were fed various other food products, which, however, have no bearing on this particular discussion.

The basic diet consisted of potatoes, bread, beef, pork, herring, sausage, dumplings, cabbage, beets, beans, peas, porridge, lettuce, cheese, cocoa (10 oz. fluid twice daily containing a total of two or four oz. of milk), margarine, jam, raisin suet pudding, and rice pudding.

No preference was shown in selecting the groups, they were as evenly balanced as was possible to make them, all things being considered very carefully by scientific people. The gains which were made were made as a result of the food and nothing else, their activities were the same, housing conditions were the same, the same factors prevailing in all cases, the only difference being the diet.

Hundreds of experiments have been conducted on small animals to prove the relative values of various foods but this is one of the most far-reaching experiments ever conducted on a large scale with children. The chart herewith shows very graphically the results of this investigation.

With reference to the addition of milk it i
definitely shown that phenomenal increase in heig
also in weight resulted, furthermore with refere
butter and margarine it is interesting to note tha
the margarine resulted in an increase in weight
not result in stimulating growth in height at al
group receiving margarine gained in height no more than the basic group. This is additional evidence to prove that margarine is rich in fats which result in the user taking on weight. The margarine did not promote growth one bit. It has often been said that margarine lacks vitamine A, which is the growt
moting vitamine, whereas butter is rich in vitam
This is very direct evidence that such is the case.

The report of the Medical Research Council,
of which was furnished me by my friend, P. B.
of England, covers nearly one hundred pages ar
most interesting document. Quoting from this
the following statement is made: "This unmist
betterment in nutrition was proved by trial to b
not to the relatively small increase in the fuel va
the dietary, nor to the extra proteins supplied
milk but rather to more specific qualities of mil
food." Another statement: "After eighteen m
observation a casual visitor entering the dinin
where the boys of nineteen houses sit at table,
never fail to recognize the table of that house whi
alone receiving the extra ration of milk, the boys
house being obviously more fit than those of an
house." Still another statement is as follows: "
was a complete absence of illness during the wi
1923 and 1924 among the boys with the milk rat
though in other houses of the village the sickne

small measure to their education which has alwa fostered by the French Bros.-Bauer Company. Th cation did not cease with teaching sanitary milk tion methods. It went a step farther and so teach most approved methods of making milk pro profitable.

There is still much to do in this respect. Pro frequently hindered by the slowness or conserva the farmers themselves. But those who first prof their educational methods today own thriving h dairy cattle whose average daily milk produc about two to three times the quantity produce herds of similar size owned by less progressive nei

Inasmuch as the greatest drawback to the dair prosperity has been the too frequent lack of high cialized milk producing breeds of cows—the Guernseys and Holsteins—this company is encou in every way, and sometimes financing, their ex purchase and breeding. They hope to make their ing achievement some day the financial success great majority of all their associated dairymen.

Sanitary milking, cooling the milk quickly in ly equipped milk houses on the farms, rapid moto portation to the refrigeration coils of country re plants, are the successive steps followed in hand French Bros.-Bauer milk and cream. Then foll swift transportation of the refrigerated milk to distributing plant. These steps are all vitally im in bringing milk to city tables pure and fresh, days of snowstorms or when the mercury register degrees or more in the shade.

Whenever a customer asks for the French Bauer very best table milk, they are sent inspect A label is on the milk cap stating that it was p under supervision of the Cincinnati Medical Mi

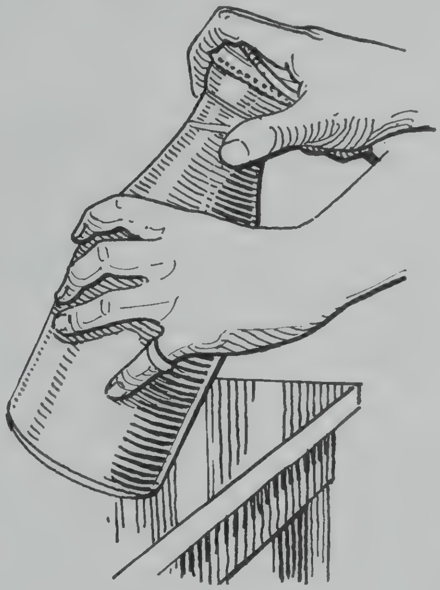
THE

DACRO

METAL CAP

Here at last is the perfect package of Milk or Cream, pure and sweet pasteurized IN the bottle! Made possible by a mechanically perfect closure.



Pure, sweet MILK—delivered under hermetic seal to the home. Handy openers supplied at small cost.

The Dacro Metal Crown — This remarkable cap is made on exactly the same principle as the famous Crown Cork which revolutionized the bottled beverage industry. The Dacro Crown is a hermetic seal. It automatically locks under the glass rim of the bottle. It is scientifically a perfect closure. Sealed with the Dacro Crown, Milk or Cream can be pasteurized in the bottle, an exclusive advantage of this seal. The Dacro Crown covers and protects the pouring lip. It KEEPS clean milk clean! No danger of contamination or tampering with pure contents. And the Dacro Crown can be replaced for temporary covering and seal after opening bottle.

PASTEURIZE YOUR MILK
IN - THE - BOTTLE

THE
Crown Cork & Seal Co.
BALTIMORE, U. S. A.

Inventors and originators of the famous "Crown Cork"

mission, and the day it is to be sold on, and telling where it was produced, bottled and sealed. It is expensive because it is produced under extraordinary conditions of sanitation requiring spick and span barns, clean and dustless, as well as perfectly groomed cows; none but those cows in the very pink of healthy condition and stamina may produce inspected milk for city tables; sealing of the bottles with the special Academy of Medicine seal is expensive, involving the cost of the seal and also that of extra labor. The inspected milk is produced and bottled on the company's farms at Lebanon, O.

Certified milk naturally has less cream than other kinds of milk. Hence it is recommended for child feeding and for adults in delicate health—but not for a rich table milk.

The French Bros.-Bauer Certified Milk Farm at Lebanon, O., has been authoritatively pronounced to be one of the most wonderful institutions of its kind in America. In fact, it was among the first four certified farms established in the United States.

As the visitor walks through this beautiful farm he is impressed with the immaculate buildings, and particularly by the unusually clean condition of the cows. The white of their coats gleams like satin, and the black is as lustrous as a silk hat. The inquiring visitor learns that the cows are washed, scrubbed and brushed twice daily, and then he understands why certified milk is truly a synonym for cleanliness. It is not hard to understand why certified is an expensive milk.

White uniformed milkers draw the certified milk from the cows. At this time not a fleck of dust or dirt is anywhere visible around the milking areas. Purity is everywhere and so the milk is truly pure. Five minutes after milking it has been refrigerated, bottled and sealed with the special seal of the Academy of Medicine. This milk is so free from organisms usually derived from barn dust, that the formation of lactic acid (which usually sours all milk) is greatly delayed. For this reason certified milk keeps in a city refrigerator a long time before souring.

Pasteurized Milk.

The start of good pasteurized milk is to produce it under sanitary conditions. Perhaps many people wonder why pasteurization is necessary, and the answer is this: If one were absolutely sure that the dust from the hay, from the grain, and from the straw bedding was the worst contamination that could be blown by gusts of wind into the milk, there would be little to fear. Such dust usually bears only innocuous organisms, or harmless bacteria, which merely sour the milk at the end of time periods of various lengths depending on how cool the milk is kept. But suppose some of these kindly, conscientious farmers are taken sick and try to keep on working for several days before being forced to their beds? This would be possible to spread disease through milk. And so the boards of health in all the communities comprising commercial Cincinnati have very wisely ruled that all milk sold therein must be pasteurized unless it is produced under the heads of inspected or certified milk.

Scientific research has demonstrated that the heating of milk to 145 degrees Fahrenheit and holding it at that temperature for thirty minutes destroys all harmful bacteria. It follows that this process, called pasteurization, makes the milk absolutely safe. There is no record of any milk borne epidemic having been traced to properly pasteurized milk.

Pasteurization does not cook the milk; it only kills any harmful bacteria which might possibly contaminate the milk, but the process also kills some harmless bacteria whose multiplication ultimately results in sour
milk. And so pasteurization not only makes a sa
and gives the customer a continuous health in
but it makes a sweet milk which does not readi
if properly refrigerated in the homes. But th
not mean that the milk will not eventually sour
normal way as it grows old.

What effect has pasteurization upon milk itse
answer is this: Pasteurization leaves the milk wi
nearly the same flavor and all of the food valu
sessed by the raw milk.

The public is always cordially invited to vi
inspect the great milk plant of the French Bros
Company and the visitors are shown what hap
milk in its progress through the plant.

A sample of the patron's milk is dipped from
and put in a bottle, it then goes into the adjac
oratory to be tested. This process assures the
that his high quality milk is recognized by this
testing, and that he will be paid for his milk upo
scale graduated according to the milk's richness
terfat. The farmer is not only paid for his mil
weight, so much per hundredweight, but also ac

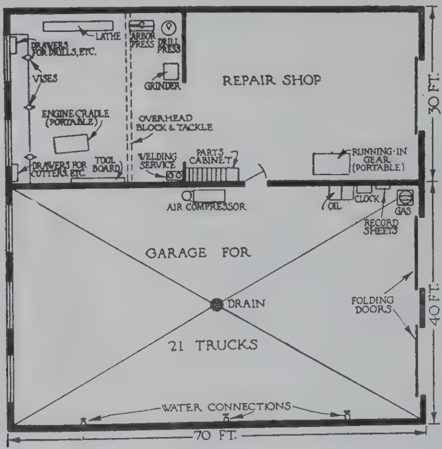
SOME NEW IDEAS ON GARAGE EQUIPMENT.

(Continued from page 23)

Machine Aligner: Necessary for exactness of work on wrist pins, bushings, rods, pistons, etc. These are testing devices necessary for prevision.

Hoist: This is a rather large device. Although it requires space, it enables complete motor to be removed from vehicle when necessary, and holds it clear from ground, permitting quick work. Also enables much other heavy lifting and carrying of heavy units.



Garage and repair shop combined. A practical layout for the average business. Shown here for 21 trucks.

Measuring Devices: For accurate work, many jobs will need any or all of the following devices, depending on the amount of work done and the character of the work:

- Micrometers.
- Calipers.
- Miscellaneous aligners.
- Scales.
- Pressure and dial gauges.
- Electric testers.

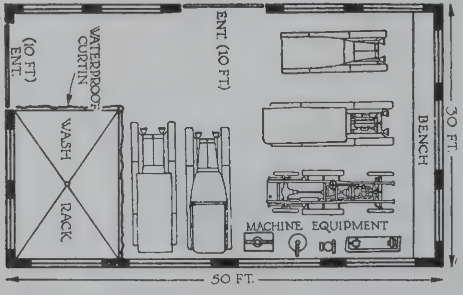
Bench Tools: Every shop needs a completely fitted work bench with commonly used tools too numerous to mention here, such as vise, bench lathe, belt lacer, valve grinder, etc.

Battery Charger: This is an inexpensive and money saving device which should be in every repair shop.

Air Pump.

Washing and Polishing Equipment.

Welding Outfit: Some concerns find it more profitable to install welding equipment than to have this done outside. Its value depends on the amount of work required of it.



A very practical arrangement for small repair shop combining wash rack.

Floor Crane: This apparatus is designed to be portable permitting engine to be lifted from chassis. Especially helpful where overhead trolley is used.

Grinding Equipment: Grinders are available for various purposes, usually power-operated, for cylinders, valves, crank shaft, etc.

Burning-In Machine: A process to free tight services. Practical for the Ford and other splas cated motors.

What Survey Showed.

In the investigation referred to above, certain tions were made to show the actual units of eq most used by the concerns interviewed. The fo table shows the same groups given earlier in this according to fleet sizes.

In this list the total number of devices used concerns interviewed is included. In other words first column under Garage Jacks, 96 jacks are 127 fleet owners. In the fifth column, 45 jacks ar used by 38 fleet owners. The reader may wond there are more jacks than the number of co listed. The reason for this is that some statio more than one jack because it is cheaper to bu than have men waiting until one which is being available.

Fleet sizes (vehicles)	5 to 10	11 to 15	16 to 20	21 to 25
Total No. each group	127	104	49	27

Cincinnati, O.

Gentlemen:

Recently we were solicited by a representative of a competitive truck manufacturer who displayed his wares, which brought about an investigation concerning the operation of your truck in the way of handling our dairy products, and we were agreeably surprised to note the saving of labor brought about since the installation of your trucks.

Considering the fact that we have materially increased our business in the past few years which entailed crowded storage quarters, we felt no inconvenience due to the fact that these trucks enabled us to easily and efficiently shift our loads. Further our regular charge of depreciation was far in excess as originally anticipated. We found little repair necessary, [illegible] long life is undoubtedly built in these trucks. It has further been proven that steelbound platforms are particularly sturdy and should last indefinitely.

In the milk business where these trucks are constantly operated in our damp wet coolers, we feel they are given a real severe job. We would be glad to have you refer any one who is considering the use of the lift trucks in their plant, particularly Creameries and Dairies.

Obligingly Yours,

THE MATTHEWS SELECTED DAIRIES COMPANY.

TAS/EF. Per. T. A. Spaeth

Make These Savings Yours

Read the letter above. Again read the second paragraph. As a matter of fact, this method repays its original cost every 120 days.

Here's how it works. Instead of lifting and re-piling cases from six to ten times, they are handled **only twice**. Piled on a platform as they come off the wagon, they are not touched until ready for the wash rack. Same with milk, into and out of the cooler. Placed on platforms in cases, they are moved as platform units. The trucker simply backs the truck beneath, elevates the load, moves the loaded platform to destination, touches a lever that lowers the load, and frees the truck for other jobs.

It is this saving in time—in labor—in re-handling—that you need just as much as Matthews or Telling Belle Vernon, who just placed another ten truck order.

Dots From the Sunny South

Dairy interests at Memphis and other cities in the tri-states report the new year opening propitiously. Nashville tradesmen were somewhat handicapped for a week in their local deliveries because of the floods from the Cumberland river, overlapping the lower sections of the city. The highest stage of the Cumberland since January, 1882, was reached in 1927, the stage going above 56 feet. About 250 blocks in East Nashville, North Nashville and Black bottom south of Broadway near the river were affected. About 3,000 people in the city were rendered homeless for the time being and it is said 15,000 in the entire flood area including many counties of middle Tennessee east and west of Nashville. Now the waters have fallen several feet in the river and the backwaters are receding rapidly. Both street car and steam traffic were much handicapped and had to move in circuitous routes. Nashville promptly raised a $50,000 fund for the flood sufferers. Hartsville in Thousdale County, Rome, Tenn., sections along the Louisville and Nashville R. R. south of Clarksville around Sailors Rest and Cumberland City and in the territory around Savannah on the Tennessee river were much affected for several days. Memphis and west Tennessee reported no overflows outside of the bottoms and none at all in the city, which is amply equipped with pumping stations for both the city and county.

In Nashville the city plants of the dairies are far removed from the river and the only inconvenience they had was to their wagons and trucks, some of the streets and bridges being closed for awhile. The ice cream factories were also outside the flood zone except the Delicia Ice Cream Co. on Monroe and First Street which is in the northeast section of Nashville proper and was somewhat cut off in the approaches for several days.

* * *

The gratifying announcement comes that the properties of C. C. Hanson, civic leader at Memphis and head of the well known Hansonhurst Dairies and Farms in Shelby county, have been discharged from the receivership in the Federal Court at Memphis when it was shown that the assets totaled $237,545.25 in excess of all liabilities. Hansonhurst is a model town near Brunswick, Tenn., and has supplied much of the dairy products for Memphis and other localities for years. It is equipped with parks, store, and covers a wide acreage.

* * *

There was a large dairy meeting held at the City Hall, Greenville, Miss., on January 6, called by N. N. Isenberg, manager of the Greenville Creamery, and others. The purpose of the meeting was to get more cows in the vicinity of Greenville. Plans were worked out for securing the best grade of cattle, the growing of feedstuffs and the manner of feeding also were topics of discussion. Prof. L. A. Higgins of the A. and M. College and department of agriculture addressed the meeting.

* * *

It is reported as probable that a new cheese factory will be built at Wesley Chapel, in Weakley county, Tenn., near Dresden. This will be the second cheese factory for Weakley county, which is one of the fine stock and agricultural counties of West Tennessee traversed by the Illinois Central and the Nashville, Chattanooga and St. Louis R. R. systems. It was decided at a meeting held that 100 cows were sufficient to start the f and nearly that number were pledged. A com composed of J. P. Bowlin, R. R. Wright and other appointed on organization.

* * *

The Pikeville Co-operative Creamery, at Pik Bledsoe county, East Tennessee, has just purcha head more of Jersey cows and most of them have a been placed with the new patrons of the creamery. makes about 100 cows that this creamery has im from outside dairy regions. This creamery start a year ago to make the Squartchie Valley one of t dairy sections in East Tennessee and they seem succeeding.

* * *

O. P. Hurd, prominent Memphis lumberman or ly from Cairo, Ill., has been elected president of t State Fair at Memphis to succeed Charles Gerbe has been at the head of this institution at Me Tenn., for the past fifteen years. The Clove operates one of the largest fleets of trucks and drawn vehicles of all concerns in the Memphis tra

"Very Convenient to Assemble, Operate and Clean"

ORANGE DAIRY COMPANY, Orange, N. J.

Gentlemen:

With reference to yours on reverse side regarding the Bestov Filter will say we have had no trouble whatever with it.

Our man finds it very convenient to assemble, operate and clean even during severest conditions.

I have been making close check up on all apparatus in our plant and have always found a nice clear response from the sediment test which I believe is due largely to the Bestov Filter.

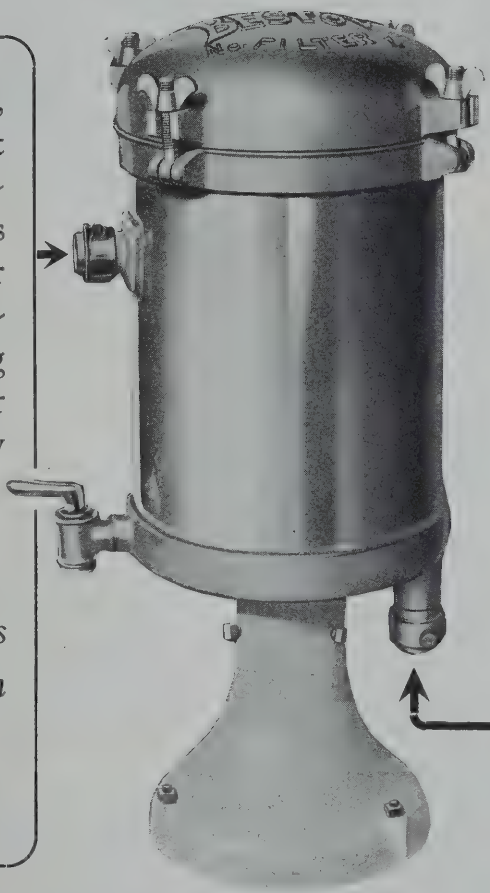
Yours in haste,

ORANGE DAIRY CO., *R. C. Stacey*

SEND FOR BULLETIN 2408-R **COMPLETE DESCRIPTION, 4 SIZES**

Clean, filtered milk, free from sediment comes from this OUTLET. Every drop is filtered and ready for the bottles—a dependable product, insuring the good-will of your customers every day in the year.

This connection is not disturbed when filter cloths are changed.



Milk just as received from the farms is pumped into this INTAKE and floods around a displacement drum, then filters through a cloth tube, held in position over a perforated cylinder surrounding the drum. Sediment collected on cloth works to the bottom permitting the cloth to filter efficiently always.

This connection not disturbed changing filter cloths.

Correspondence Covering a Variety of
jects of Interest to Milk Distributors

Dear Sir:—I will be much obliged to you if you let me know the equivalency, as feeds, between cottage cheese and beef, eggs, mutton, fish and chicken and some other foods pound per pound.

I want to advertise this equivalency here to make our people eat cottage cheese.

Reply: I just received your letter requesting information relating to the comparative food value of cottage cheese. I believe the following data is exactly what you desire. It is taken from U. S. Department of Agriculture, Bureau of Animal Industry leaflet A. I. 24 and from the University of Illinois Circular 235.

For furnishing protein one pound of cottage cheese equals:

1.27 pounds sirloin steak.
1.09 pounds round steak.
1.37 pounds chuck rib beef.
1.52 pounds fowl.
1.46 pounds fresh ham.
1.44 pounds smoked ham.
1.58 pounds loin pork chop.
1.31 pounds hind leg of lamb.
1.37 pounds breast of veal.
14 eggs.
1.7 pounds mutton, fore quarter.
1.53 pounds mutton, hind quarter.
1.36 pounds halibut steak.
1.50 pounds salmon.
1.28 pounds mackerel.
1.96 pounds whitefish.
3.06 pounds baked beans, canned.

For supplying energy one pound of cottage cheese equals:

8.33 ounces sirloin steak.
11.25 ounces round steak.
11.25 ounces chock rib beef.
10.75 ounces fowl.
5.50 ounces fresh ham.
5 ounces smoked ham.
6 ounces loin pork chop.
7.33 ounces hind leg of lamb.
12.75 ounces breast of veal.
6.7 eggs.
6.5 ounces mutton, fore quarter.
6.6 ounces mutton, hind quarter.
1.08 ounces halibut steak.
1.37 ounces salmon.
7.9 ounces mackerel.
1.52 ounces whitefish.
13.7 ounces baked beans, canned.

I would suggest that you write the University of Illinois, Urbana, for a copy of Circular 235 as this is a very handy publication in that it relates to the food value of various dairy products compared with other materials.

* * *

Dear Sir:—We are having lots of trouble to get the overrun up in the manufacture of butter. At present we run from 12 to 14 per cent. We have been running it through a viscolizer with no pressure on it. We pasteurize it in one vat and let it stand thirty minutes and pump over to the other one and cool with brine down to about 48 degrees. We have been letting it stand about three hours and then churning begins in about five or ten minutes. Do you think to lower the churning
perature would help it? The butter is lumpy and
hard to get the moisture down; working it make
butter soft and oily.

The cream we have been getting is a pretty
grade. It runs about .60 in acidity, and neutralizes
to .25, then pasteurize on up to 150 degrees F.

Reply: Your letter just received, and I believ
difficulty which you are having in obtaining over
caused by too much pumping for one thing an
cooling low enough for another.

In your letter you state you are using a visc
without pressure, as a pump and then after paste
tion you pump it into a second vat. This would te
break the fat particles into very find globules and
them unite in a more compact mass, allowing less
for the incorporation of moisture.

You state you are having difficulty in getting
12 to 14 per cent overrun, and yet you mention th
that you are also having difficulty in keeping the
ture content down. As you undoubtedly know, the
ture content influences the overrun directly as doe
the amount of salt and curd which the butter con
and I am wondering if the system which you use in
ing may not be somewhat at fault. It should not be
difficult at this season of the year to control the
ture and overrun. It is true that in the spring p
when the cows get out on pasture the moisture co
tends to be somewhat high because the butterfat glo
in the cream are soft and the rapid churning o
product prevents the moisture from being beaten o
the product in the churn. I suggest you try drop
the temperature down to about 46 degrees F., b
very careful as this is a mighty low temperature
might result in partial whipping instead of chur
The cream for churning should test about 33 per
fat and the churning period should take from
45 to 50 minutes.

I suggest you try one or all of the following reme

1. Hold the cream over night at a temperatu
45 degrees F. and warm up to the churning temper
three hours before churning or cool to two or thre
grees lower than your present churning temperatur
hold three hours before churning.

2. Standardize the fat to 33 per cent, using
milk.

3. Avoid double pumping of the cream, espe
through the viscolizer.

* * *

Reply to G. J. C.: There are many causes for a
tion in the churning time, two of which, probabl
most prevalent, are improper temperature and fu
of the churn. The correct temperature for churnin
pends on several factors, such as the richness o
cream, acidity of the cream, type of churn and tem
ture of the atmosphere. Very rich cream churns
quickly than thin cream and the temperature ca
somewhat lower. It is also necessary to have the
perature a little lower for the churning of sweet
than sour cream in order that less fat may be l
the buttermilk. Again, if you happen to be churn
a warm room, in a metal type of churn the crean

Shipping Milk 1,800 Miles to Market

A FINE achievement of unusual note was the transportation of milk, in perfect condition, from point of shipment to point of unloading, over a distance of 1,800 miles, from Marshfield, Wisconsin, to Miami, Florida.

In Florida, the milk problem has been a vitally real one. Cows do not thrive there. Fresh milk is costly—35 cents a quart. The supply is limited.

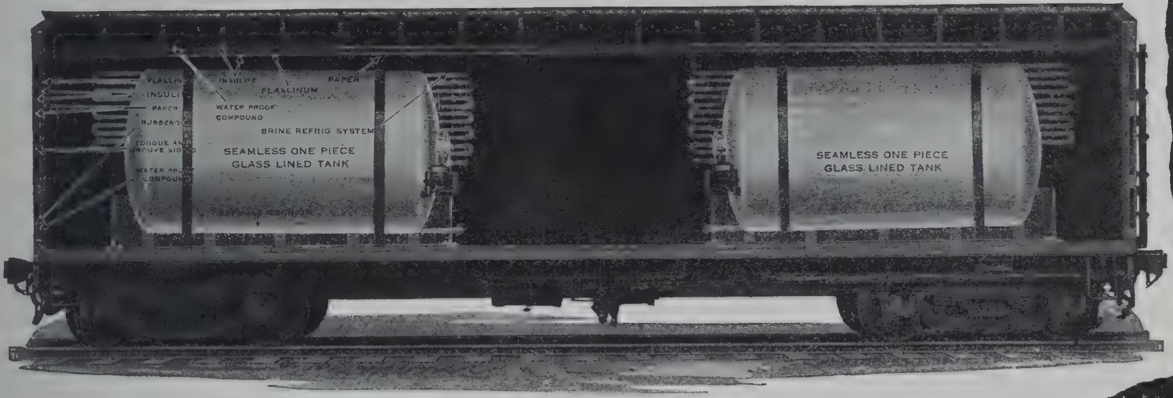
made the Tanks.



The insulated car containing a refrigerating system and a large glass-lined tank in which milk was shipped safely 1,800 miles

At Marshfield, Wisconsin, a glass-lined milk tank-car was loaded with tuberculin-tested milk. Dr. Franklin Leiter, City Physician of Marshfield, inspected the content and equipment of the car. It contained six thousand gallons of milk, 40 ten-gallon cans of 40 percent cream. The content was cooled to 35 degrees, the car was locked and sealed, and with the temperature outdoors at 26 degrees, it was sent on its way from Marshfield at 1 P.M., Tuesday, February 16, 1926.

The car reached Miami, Florida, four days and five hours later. Its contents are said to have arrived in perfect condition, the temperature of the milk being 36 degrees, with an outdoor temperature of 92 degrees. The milk was shipped 1,800 miles with an outside temperature change of 66 degrees. Under these conditions the temperature of the contents remained within only one degree of its original.

What the effect of this unusual trial test on the future of milk shipment will be, it is hard to predict. If it proves practicable, and economical, to ship milk over distances as great as 1,800 miles, a great shift in American dairying industry may take place. Almost certain it is that the old-fashioned method of shipping milk in cans, that is, in broken bulk, is inefficient and costly.

Standardization

— of —

Dairy Equipment

The enviable high degree of efficiency attained by many plants is due largely to the standardization of dairy equipment.

Approved sensitive bulbs and standard sanitary vat fittings for all makes of pasteurizers are included among the many features that recommend

BRISTOL'S
Recording
(Dairy) Thermometers

Other characteristic features of Bristol's Recording Thermometers are the trouble free working mechanism of simple construction, and the direct attachment of penarm to pressure element, insuring an accurate record at all times.

If you did not receive a copy of our latest bulletin at the Dairy Show write us for it now.

The Bristol Company Waterbury, Connecticut
FOR 36 YEARS MAKERS OF

BRISTOL'S RECORDING INSTRUMENTS

BRISTOL'S—The most extensive line of recording instruments, including — Pressure, Liquid Level, Temperature, Electricity, Motion, Speed, Humidity, etc. Ask for our catalogs.

soon become warmed because the metal is a **poo**
lator and the cream may churn more quickly th
sired.

I think from this you can readily see that the
temperature for all cream cannot be given. If the
churned in seven or eight minutes and the next
takes thirty, at the same temperature, then the fi
too rich or too warm and the temperature may
ered two or three degrees for the next batch, pro
of course, it tests the same at each churning.

Now as regards the fullness of the churn.
churn is over half full it may take a considerable
of time to churn. If not quite half full, the churni
be much more rapid, but here again we find the r
of the cream, acidity and temperature to be closel
ciated. The churn for best results should be just
below half full.

In order to give you some definite idea with
to the various points of churning, I will say that
should contain about 30 to 35 per cent fat. The te
ture for summer churning should be 48 to 58 deg
and for winter churning 54 to 62 degrees F. The
of the cream is developed to about 45 degrees for
which is to be sold immediately, whereas butter
to be held for any length of time before selling,
be made from cream of low acidity, possibly .25 p
to .3 per cent acidity.

You ask regarding ways to determine whether
is sweet or sour. There are several methods of
for acidity. The most desirable method for farm
undoubtedly the use of Farrington's alkali table
tion. The alkali tablets come in a small can and
solved in water—a certain number of tablets pe
volume of water and this material added to a
quantity of cream until the product turns pink, s
that all acidity has been neutralized. The per
acidity is then read directly from the cylinder con
the alkali tablet solution.

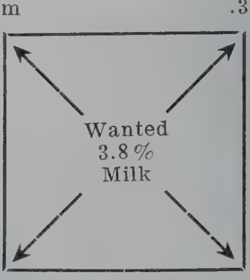
* * *

Dear Sir:—We would like it if you could gi
formula on building up milk. I mean if we ha
quarts of 3.5 per cent milk and would like to
up to 3.8 per cent fat and want to use either 2
per cent cream how much of each should we use

Reply: I am glad to describe the following
which will enable you to standardize milk. This
was devised by Dr. R. A. Pearson, formerly of
University.

First draw a square and in the center place t
centage of fat desired in the finished product.
left hand corners of the square write the percent
fat in the substances which you have on hand
in standardizing. Now subtract diagonally acr
square, always subtracting the smaller figure fr
larger, thus:

On hand
20% cream .3 parts of 20% cream t



On hand 16.2 parts of 3.5% mil
3.5% milk

The results show the ratios of each substance
For example: Three-tenths parts of 20 per cent cr

Where Will You Buy Your 1927 Crates ? ?

The choosing of the best merchandise for its cost puts a big responsibility on the man holding a buyer's job. In the purchase of crates for this year we are making the buyer's task an easy one. We have combined the two really important features of crate construction—i. e.:

Durability of Crate
Its Protection to Bottles

This is such an outstanding case that no Central Western milk dealer can afford to ignore it. A request will bring a free sample.

MILK BOTTLE CRATE CO.

Milk Bottle Crate Co.

1543-45
Kingsbury St.,
Chicago

When writing to MILK BOTTLE CRATE COMPANY *please mention The Milk Dealer.*

used with every 16.2 parts of 3.5 per cent milk. Note that the parts to use of each substance are in the corner of the square directly opposite the particular product used in standardizing.

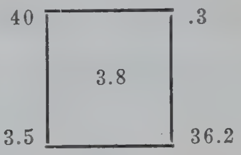
Therefore 16.2 parts is equivalent to 1200 pounds

$$\text{and one part is equivalent to } \frac{1200}{16.2} = 74.07$$

Then .3 parts, which is equivalent to the cream to add is 74.07×.3=22.2 pounds of 20 per cent cream to add.

The total amount of milk which you will have when you finish standardization will, therefore, be 1222.22 (1200+22.22).

Figure the amount of 40 per cent cream to add, in the following way:



36.2 parts are equivalent to....1200

$$\text{One part is equivalent to......} \frac{1200}{36.2} = 33.14$$

.3 part is equivalent to 33.149×.3=9.95 lbs. of 40% cream to add.

To prove it, proceed as follows:

Proof for Use of 20% Cream.

1200 lbs. of 3.5% milk contains (1200×.035)=42.00 lbs. fat.
We figured that 22.22 lbs. of 20% cream must
be added. Hence it contains (22.22×.20 = 4.44 lbs. fat.

Total fat in 1222.22 lbs. of 3.8% milk.......=46.44

Proof for the Use of 40% Cream.

1200 lbs. of 3.5 milk contains (1200×.035)=42.00 lbs. fat.
We figured that 9.95 lbs. of 40% cream must
be added. Hence it contains (9.95×.40)..= 3.98 lbs. fat.

Total fat in 1209.95 lbs. of 3.8% milk......=45.98

* * *

Reply to E. H. M.: I am glad to give you the following information relative to the calories found in the products which you mention. I am also showing you how I have computed this data, as it might be necessary for you to make some rapid computations in the future.

First: Determine the weight in grams of one pint or whatever voume is desired. To do this two factors are required:

1. The voume of a pint liquid which happens to be 473.2 cubic centimeters.
2. The specific gravity of the liquids for which we desire to determine the caloric value.

The approximate specific gravities for the various products which you list may be given as follows:

Product	Specific Gravity	Weight of a pint in grams
3.5 per cent milk....	1.032 taken for normal milk.	488
4.0 per cent milk....		488
4.2 per cent milk....		488
20% sour cream....	1.008	477
22% cream		477
32% cream	.990	468
40% cream	.966	457
2% buttermilk	1.034	489
Acidophilus milk from skimmilk	1.036	490

You will note from the above that the weight of a pint in grams is obtained in each case by multiplying the cubic centimeters per pint by the specific gravity. Thus: 473.2×1032=488+.

Second: Obtain the calories furnished by fat, protein and carbohydrates. This has already been worked out by Sherman who assigns the following approximate energy values:

Proteins, four calories per gram.
Corbohydrates, four calories per gram.
Fat, nine calories per gram.

Third: Determine the per cent solids-not-fat
product in question.

For milk this is obtained either from tables o
formulas figured on the basis of the fat per ce
lactometer reading.

For cream you may figure as follows: Subtra
fat per cent from 100 and multiply the remainder,
is equivalent to skim milk, by 8.9 per cent.
100—20=80 and 80×.089=7.12 per cent solids-not

Fourth: The solids-not-fat are made up of case
albumin which is the protein; milk sugar which
carbohydrates and also ash. Ash is therefore not
considered. Luckily it runs fairly constant in mi
ing about .7 per cent. Hence to obtain total prote
carbohydrates, it is but necessary to subtract .7 pe
from the per cent of solids-not-fat. In cream I f
the solids-not-fat per cent as mentioned above an
tracted .5 per cent (representing the ash) from t
cent solids-not-fat in case of 20 and 22 per cent
and .4 per cent in the case of 32 and 40 per cent cr

Fifth: To find the calories furnished by the fa
tiply the weight per pint in grams (488— for mi
the per cent of fat and then by the calories fur
per gram of fat, which is 9. Thus: 488×3.5×9=

To determine the calories furnished by the p
and carbohydrates first subtract the per cent of ash
the per cent solids-not-fat. Then multiply 488 b
result and by 4. Thus: 8.70—.7=8 and 488×8×4=

The figured results are tabulated in the foll
table:

Per cent Fat	% carbohydrates and proteins or % S. N. F. minus % ash (minus .7%)	Calories furnished by fat per pint	Calories furnished by carbohydrates and proteins per pint
3.5	8.00	153.72	156.04
4.0	8.11	175.68	158.28
4.2	8.15	184.46	159.08
	(minus .5%)		
20 sour cream	6.63	858.60	126.50
22	6.40	944.46	122.11
	(minus .4%)		
32	5.60	1347.84	104.83
40	4.95	1645.20	90.48
	(minus .7%)		
2 buttermilk	7.70	88.02	150.60
Acidophilus milk (skimmed)	7.30	Depends on fat test	142.68

In regard to the acidophilus milk I am uncer
to the per cent of fat which the product contai
you are making acidophilus milk from skim m

Fluid Milk Market Report for United States for Dec.,

By Bureau of Agricultural Economics, Market News Service, United States Department of Agricult

Table I—Producers' Prices for Standard Grade Milk Testing 3.5% Butterfat, Delivered F. O. B. Local Sh Point or Country Plant.

Prices which appear in this report are secured through the co-operaton of milk distributors, producers' asso and municipal officers. Dealers' buying prices unless otherwise indicated, represent prices applying to all milk de by producers. For cities where a "surplus plan" is in effect, the prices reported in table III are for "basic" qua All per cwt. buying prices have been converted to a 3.5% butterfat basis for comparative purposes.

Sections	Range of December Prices		Prices Compared for Same Markets		
	Number Local Markets	Prices per Hundredweight	Number Local Markets	1926 Average for December	1926 Average for November
New England	9	$3.00–$3.82	9	$3.48	$3.45
Middle Atlantic	15	2.35– 3.15	15	2.86	2.85
E. North Central	22	2.05– 3.23	22	2.61	2.57
W. North Central	20	1.75– 2.75	18	2.35	2.28
South Atlantic	14	2.80– 5.90	14	3.85	3.82
E. South Central	5	2.35– 3.40	5	2.70	2.66
W. South Central	6	1.90– 3.04	5	2.68	2.78
Mountain	5	1.93– 3.20	5	2.45	2.44
Pacific	9	1.95– 3.03	8	2.66	2.67
United States	105	1.75– 5.90	101	2.85	2.79

Above prices include "basic" prices where a surplus plan or pooling plan is in effect. Cities where prices ar upon current butter quotations not included.

Table II—Prices for Special Grades of Milk and Certain Milk Products.

The following table shows the wholesale and retail prices reported for "special" and "certified" milk and certai products delivered at wholesale buyers' places of business and at the home of retail customers.

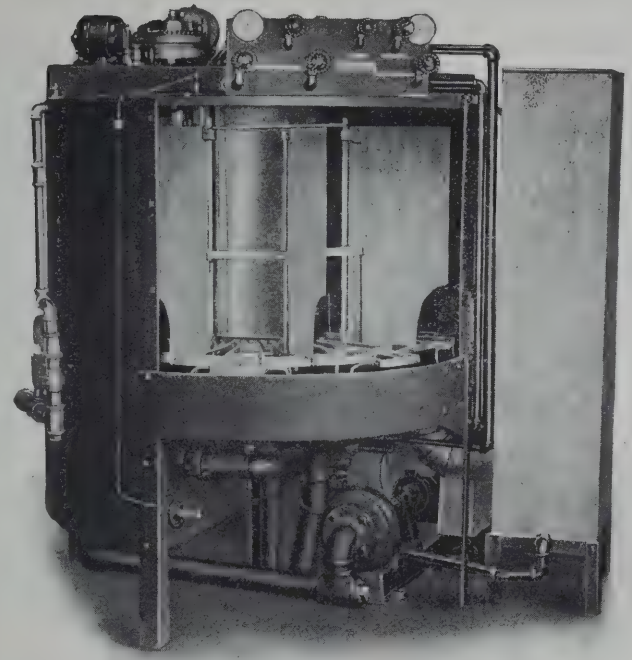
R & A LOW DUTY ROTARY CAN WASHER

The machine illustrated is our Style No. 96. Thoroughly washes, rinses, sterilizes and dries three cans per minute.



R & A MEDIUM DUTY ROTARY CAN WASHER

This washer — Style No. 93 — is the larger of the R & A Rotaries, easily handling six cans per minute.

This R & A Rotary *welcomes comparisons!*

IF you are buying a Rotary Can Washer, and are considering one of the R & A Rotaries, not only would we welcome comparison of this washer with other can washers — but we urge you to compare all the important construction and operating details of the R & A Rotaries with those of other machines.

Compare the R & A Intermittent Power drive. Simple, perfectly controlled and perfectly timed. On top of machine, and equipped with a sensitive safety-friction-clutch. Keeps cans over jets 75% of time — 50% increased efficiency.

Compare the valve mechanism on top of the machine, its positive operation, and the accessibility of every part.

Compare the compact, solid arrangement of pumps, motor and fan. Note particularly the new pumps. Double the volume of water without increased motor size.

Compare the automatic jet operation — the position of the jets — the non-clogging nozzles.

Compare the tremendously strong construction of the machine — its tanks and hood of heavy Armco Ingot Iron.

Compare its low operating cost, and the ease of maintaining the R & A Rotary.

Then see the washer in operation. Note how smoothly and efficiently it works — how every can comes out perfectly clean, dry and sterile.

After you've made these comparisons, you'll know which can washer gives you greatest dollar per dollar value — which can washer will give you the utmost in efficient, economical, enduring service!

Let us send you complete literature and prices.

A Non-Debatable Record

is furnished by the

***Tycos* Recording Thermometer**

There can be no argument about temperature or time when a *Tycos* Recording Thermometer Chart is in evidence. Questions such as, when the heat was turned on, how long it ran, how hot it got, and when it was shut off, are all answered by the Tell-Tale line.

When you have a *Tycos* you get the facts.

All *Tycos* Recording Thermometers are equipped with dust proof case, patent pen arm sealing device to prevent adjustment by unauthorized persons; high grade, specially designed clock movement, riveted pen arm, to insure correct time readings and bearing pressure of pen point on chart; and are under lock and key to eliminate willful or malicious interference with the record.

Bottle Washer

y Ladewig-Soelch

TWENTY-TWO years of outstanding success in designing and building bottle washers have produced this latest and most perfect of all machines — the Ladewig-Soelch, built by A. E. Ladewig and G. F. Soelch.

It is truly a masterpiece of mechanical engineering. It has everything you would want a bottle washer to have. And no matter what you demand by way of service from this Ladewig-Soelch, you will get it in speed, capacity, accessibility, adaptability and trouble-proof operation.

Complete information containing the remarkable story of this new and advanced Ladewig-Soelch Bottle Washer will be sent to you on request.

INSISTS UPON ACCURATE PASTEURIZATION HOLDERS.

Since 1923 representatives of the New Jersey State Health Department have been testing all forms of continuous flow and pocket type pasteurizer-holders. The test used was that devised by the U. S. Bureau of Dairying and known as the "prodigiosus method." Where the results of these tests have shown a holding period of less than 30 minutes as required by the department, the owners of the plants were notified and advised to remedy the defects as soon as possible.

In 37 of the 55 plants tested the inaccurate holding method has given way to a more positive holding system. Believing that the operators of the remaining 18 plants have had sufficient time to make the necessary changes in their equipment, the department recently
issued an ultimatum, expiring June 30, 1927, in
all plants must have a pasteurizing system that w
itively hold the milk at least 30 consecutive minut

In addressing a meeting of the Northern Ohio
Inspectors' Assn. at Cleveland, O., in December,
Bailey of Pittsburgh, president of the American
Federation, took the opportunity to give the res
the use of milk in lead poisoning. Mr. Bailey
that it is the first lead poisoning control found
how it works has not been discovered, he said,
reduced temporary disability among Cincinnati
makers from 8 to 1½ per cent and abolished per
disabled cases from lead poisoning altogether.

Lead poisoning continues to decrease with
tended use of milk, Cincinnati experiments prove.

UNCLEANLINESS

a destroyer of milk quality, and is almost invariably caused by apparently small and unimportant ctors of production.

Real sanitary cleanliness is the only cure. Sanitary cleanliness goes beyond the cleanliness that tisfies merely the eye. It includes the emulsification of all butter fat deposits as well as the thorgh dissolving of casein. It strips all unseen greasy and harmful films down to the natural clean rface of dairy equipment so that harmful bacteria cannot propagate.

This is the service which for over twenty years has characterized the use of

Wyandotte
Cleans Clean
Sanitary Cleaner and Cleanser

It means the purifying and deodorizing of all surfaces with which milk foods come in contact. Real sanitary cleanliness is the dairyman's positive insurance against loss of quality in milk products and the consequent loss in profits.

OHIO DAIRY PRODUCTS MANUFACTURER MEET IN CINCINNATI.

The annual meeting of the Ohio Milk Distri
will be held in connection with the fourth annu
vention of the Ohio Dairy Products Association a
cinnati, January 25 and 26. Early indicatio
that the strong program arranged and the ex
entertainment which will be provided by the Cin
dairy products industry will draw ice cream ma
turers, creamerymen and milk dealers from all
surrounding states.

The early arrivals will be made welcome at a s
given by the Cincinnati crowd on Monday evenin
24th, at the Gibson Hotel, convention headquarter
program will open at 10:00 a. m. Tuesday, Janua
in a joint meeting with milk dealers and creame

A get-together luncheon will be held at no
Tuesday when the whole crowd of men will sit do
food, friendship, and fun. The balance of the tw
will be spent on questions of concern to the indust
cepting the time at the joint banquet in the Sinton
on the evening of the 25th.

A good program of special interest to milk d
has been prepared.

On Wednesday evening the Cincinnati host
spread a real party at Heidelburg, across the river
invitation to this reads "come early and stay lat
by all means leave your reserve, grouch, or any
unsociable attributes behind."

Thursday the crowd will travel to Lexington
for a meeting of the Dairy Products Association o
tucky, where the colonels will put on the show
day.

The ladies are invited and a full program ha
arranged for them from time of arrival to departu

Cincinnati knows how to entertain and invit
industry of surrounding states to gather there o
uary 25 and 26.

A-SMILING THROUGH.

By Vernon Varney.

The rain in sheets poured down the streets,
But he'd a task to do,
So on he slipped his slicker sleek,
And went a-smiling through!

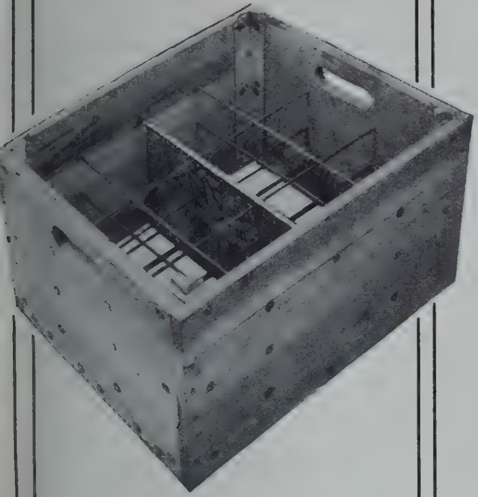
The Boss was cross, and all the force
Did growl instead of coo,
But he forgot to see the lot,
And went a-smiling through!

His head did ache, his heart did quake,
His arms and legs hurt, too,
But for his ills, he took DOC'S PILLS,
And went a-smiling through!

His work was hard; his grouchy pard
Quit cold at half past two,
But he kept on, despite the storm,
And went a-smiling through!

Amid the roar, his part he bore,
And other fellows', too,
He kept the men together, when
He went a-smiling through!

And when some day, faint voices say,
"There's no more work to do,"
I'll bet my pay, St. Peter'll say,
"JUST GO A-SMILING THROUGH!"



"As strong as the Republic"

REPUBLIC BOTTLE CRATES

Carefully built of the finest materials and designed to stand gruelling, everyday use and abuse, Republic Bottle Crates work on the route — not in the repair shop.

Longer Service at Less Cost

An unusual feature found only in Republic Bottle Crates is the high, one-piece galvanized iron center spacer which keeps the rods permanently in line and prevents sagging. Corners are heavily re-inforced with galvanized metal which also forms stacking irons and bottom corner protection.

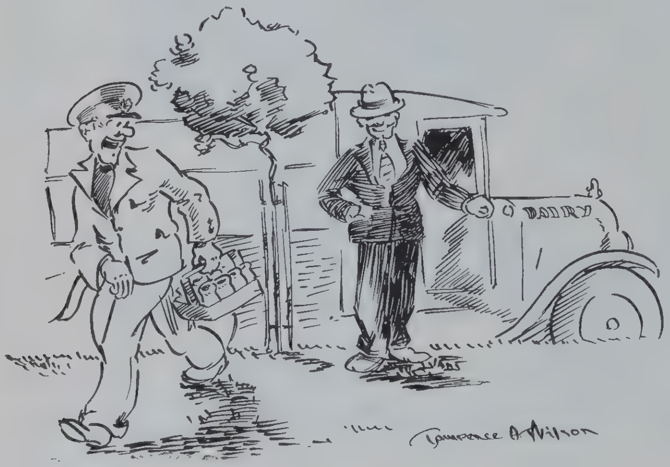
MIKE THE MILKMAN

THE BOSS GOES WITH ME

My boss is a dandy, right up on the bit, with no fancy notions mixed up with his wit; he knows that the heart of his business, by gee, is out on the wagons with fellows like me, so yesterday climbing right up at my side, said, "Step on it, Mike, I am out for a ride; I'll help you deliver, and sell, if you please till the sun goes to bed with a pain in his knees!" He went along with me, from wagon to door, to apartments as high as the seventeenth floor; he carried a rack full of bottles at times and went on high gear in the most of his climbs. He heard my suggestions and listened to learn, and offered suggestions when it was his turn. "Why this?" and "Why that?" were his queries to me, "That's bully boy, Mike, you're a winner, I see!" One woman came out with a tiny complaint, and hinted the milkman was far from a saint; I smoothed out the trouble, the boss looking on, and he smiled to himself when the storm clouds were gone. The lady, in fact, was so pleased, that she took another full quart as she softened her look. "I'm learning a lesson," the boss said to me, "And now, more than ever, I'm sure that I see the heart of this business is out on the cart, the fellows like you are in charge of the heart. I'm learning and seeing that you are the man who stands at the center and root of the plan; when you are a failure then I'm on the blink; when you're a success, I'm in clover, I think! I've preached this for years in a second hand way, but never have felt it as I do today! Next Monday I'll ride on your wagon again, keep up the good work on your wagon till then!"



IMPORTATION OF MILK AND CREAM.

Eastern shippers and dealers in milk and crea particularly interested in a bill now before co which seeks to regulate importation of milk and from Canada. It is House Bill No. 11,768, and has favorably reported from the senate committee on culture.

The senate committee has inserted an amend which would exempt certain classes of milk fro requirement that imported milk must be from tube tested herds and that its temperature at the time portation must not exceed 50 degrees F.

The amendment was agreed upon at a confere spokesmen for interested parties during the hea before the senate committee.

The amendment is as follows: "The secreta agriculture is directed to waive the requirements of graphs 2 and 5 of section 2 of this act insofar a same relate to milk, when issuing permits to ope of or producers for delivery to creameries and co ing plants in the United States within 20 miles point of production of the milk and who import n milk except for pasteurization or condensing.

"Providing, that if milk imported when the re ments of paragraphs 2 and 5 of Section 2 have be waived, is sold or used or disposed of in its raw or otherwise than as pasteurized, condensed or e rated milk by any person the permit shall be re and the importer shall be subjected to fine, impriso or other penalty prescribed by this act."

Representative John Taber of Auburn, N. Y., a of the bill, Senator Lenroot, Wis., who introduce counterpart in the senate, attended the conferen which the amendment was agreed upon and Repres tive Taber later reported this agreement to the mittee.

Before this agreement had been reached, Se Copeland of New York had appeared before the co tee to ask that the bill be modified to make the re ments it would impose upon Canadian milk the sa those now imposed by New York City. The senator into the record a letter from the health commissio New York in which the latter asserted that to c the supply of Canadian milk and cream would cre serious shortage in the metropolis and undoub would lead to a substantial increase in price.

Other witnesses heard by the committee, all of asked for favorable report on the bill, were: Charl Holman, secretary of the National Co-operative Producers Federation; Chester Gray, representin American Farm Bureau Federation; and A. M. Lo who appeared on behalf of the National Grange.

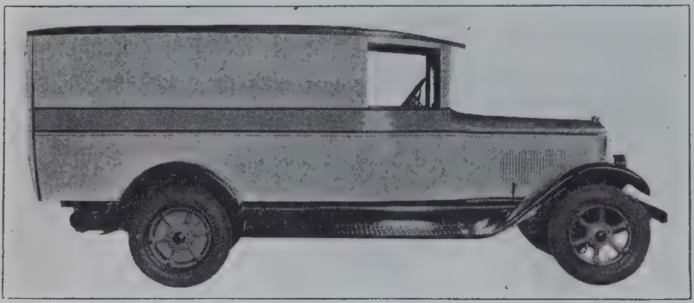
News of Interest Concerning What Our Readers and Advertisers are Doing
to Develop the Industry. We Invite Correspondence Relative
to New Products and New Equipment.

NEW ONE AND TWO-TON TRUCKS.

Official announcement has been made by John Hertz, chairman of the Yellow Truck and Coach Manufacturing Company, that early in 1927 they will market trucks of one and two-ton capacity equipped with the over-head valve, six cylinder Buick engines. A complete line of these trucks were exhibited for the first time at the New York National Automobile Show. This news is the logical outcome of the amalgamation of the Yellow Truck interests with the General Motors.

These new one and two-ton trucks have had the most grueling tests at the General Motors proving ground, under the supervision of General Motors engineers.



Model T-20 Yellocab Express, one ton truck, with vestibule type driver's compartment.

They are built to meet present-day needs, according to Mr. Hertz, the six cylinder power plant insures maximum acceleration and flexibility. They are capable of operating at unusually high speeds and the braking equipment insures quick stops. The two-ton trucks are equipped with four-wheel brakes.

The new one-ton Yellocab Express and two-ton Yellocab Merchantman, which will be manufactured at the General Motors Truck Company, Pontiac, Mich., make their bow with a number of advanced features. All will be equipped with the Buick power plant, self-starters, extra heavy truck type of axles, and on the two-ton models four-wheel Bendix brakes.

The engineers had in mind in the construction of the new models these essentials—simplicity, ruggedness and economy of operation. At the same time every consideration was given to provide the driver with the utmost comfort. Care and attention was also given to the matter of appearance in both chassis and body—the lines are pleasing and one gets an impression of rugged simplicity. The new chassis will be sold with or without bodies. A full line of bodies is announced with the line.

The one-ton model T-20, with a chassis road weight of 2,750 pounds, will have a wheelbase of 132 inches. The two-ton model T-40, with a spiral bevel axle and pneumatic tire equipment, has a chassis road weight of 4,325 pounds and will be furnished in three wheelbases, 136, 150 and 162 inches. The two-ton model T-50, with a worm axle and solid tires, will have a chassis road weight of 4,630 pounds and will have the same wheelbases as the model T-40.

These three new models give this company a range of trucks from one to fifteen tons capacity.

SHIP REFRIGERATOR DOORS TO JAPAN.

A large shipment of refrigerator doors was sent to Japan by the H. Ehrlich & Sons Manufacturing Company of St. Joseph, Mo., according to a letter received by Albert H. Ehrlich, treasurer. The doors are to be used in a cold storage plant and were equipped with the Ehrlich patent self-closing hinges and automatic door fastener.

HUGE CORK SHIPMENT.

We are in receipt of an interesting letter from L. M
& Son, Inc., Hillside, N. J., together with a photogra
the steamship Amarante, which we are re-producing
They state that, so far as they know, during May, 1926
ship carried the world's largest cork shipment. They
regarding this incident as follows:

"This steamship Amarante was our regular monthly
ter boat. On arrival from Portugal during the last we
May, 1926, it carried what we believe was the largest
load of cork or cork products that ever came to Am
This boat contained 38,000 bales of cork waste for the

side plant of L. Mundet & Son. The deckload alone
8,000 bales.

"In spite of this tremendous volume of cork, it wa
teresting to note that the boat rode very high in the
Cork weighs only 15 pounds per cubic foot, whereas cas
weighs 450 pounds per cubic foot. In other words, cas
weighs thirty times as much as cork. It is obvious th
order to load down any ship to the water line, with
most of the cargo's volume would be above the wate
and the ship would be rendered unstable.

"Owing to the many remarkable physical characte
of cork—its lightness; the multitude of microscopic air
its natural waterproofness; its strength; its durabilit
elasticity, and its adaptability to being ground and bak
to pure cork slabs—cork is the best insulating ma
known to science, particularly for cold storage insulatio
cold pipe lines. The cork that we import into the U
States on the Amarante, and on other ships, is converte
pure high-grade cork board in slab form and into mo
fitting form for pipes."

IDEAS OF A RAIL MECHANIC LEAD TO A LARG FACTORY.

An idea born while he was working at a machinist's
at the Green Bay shops of the Milwaukee road founde
largest plant in America producing mechanical marvel
automatic bottle washing, important in the dairy and
erage trades.

George J. Meyer, head of the George J. Meyer Mar
turing Co., 576 Clinton St., merely had an idea 20 years
During the time he was working with his hands at the
chine bench he was evolving the plan of a machine that
wash bottles.

Coming to Milwaukee in 1904, Mr. Meyer started wo
a small machine shop but his capital was more limited
his energy and for a time he had to abandon the idea of
ing the machine automatic. Then came patents on conv
and washers and then perfection of a machine elimin
hand washing.

The machine is built to wash 60 to 200 bottles a m
feeding itself and discharging the bottles cleansed and s
ling dry. There are eight separate processes, including
through a tank of caustic solution. Revolving brushes

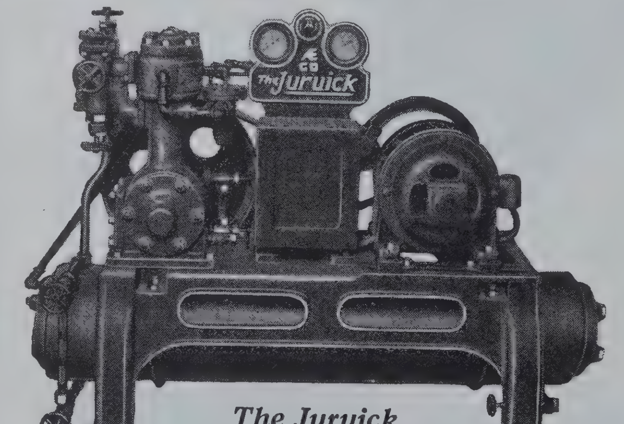
Juruick
REFRIGERATION



The Juruick Refrigerating Unit

The Juruick Refrigerating Unit provides the simplest, surest, most economical means of cooling milk and keeping it fresh. It gives absolute control of temperature automatically. Just turn the switch and the Juruick will operate without further attention, running only when necessary to keep down the temperature. This makes it economical of power and water. A range of sizes provides for various needs.

Send for Juruick folder today.

American Engineering Company
2417 Aramingo Ave., Philadelphia, Pa.

a steady spray of hot water clean the bottom, out inside of the bottles, and finally it passes over electr for inspection.

Once fed into a machine the bottle must emerge c sanitary. Costs of the machines range from $7,500 500 for the larger types, such as recently installed Bowman Co., Chicago milk dealers, in Illinois and W receiving plants.

The Milwaukee plant employs more than 400 and foundries for bronze, iron and pattern shops and depa for the complete construction of the novel machine used on a world wide basis. One of the most import tors in the sale of the Milwaukee made machines, re cers, is the demand of consumers for thorough sanit containers used in marketing of food products.

A HANDYCAP FOR HANDICAPS.

MILK BOTTLE OPENER
AND
COVER
HANDYCAP
NEWARK, N.J.

The handicap of the old way of opening milk bott pick, fork, knife, fingers or any other thing which to be at hand, and which often causes splashing, messing and damage to clothes and temper, can be overcome with the new Handycap being offered by the Handycap Company of Irvington, N. J.

This is a special aluminum opener and cover and has nickelized steel teeth which are rustproof and sanitary; this device grips the cap as it is turned, and also serves as a cover, guarding milk and cream against dust and gern prevents spiling.

Housewives of the nation are the people who will by this handy contrivance, and they would be real ap tive of this article, it is claimed.

BOILERS

FOR CREAMERY REQUIREMENTS

Back in the early Fifties when Lincoln was still a country lawyer John Brownell built the first Brownell Riveted Steel Boiler. Seventy-two years later — the good year 1927 — the Brownell Riveted Steel Boiler is doing power and heating duty in every state—in perhaps every civilized land on the face of the globe.

You who operate creameries will find Brownells dependable, long-lived, easy to fire and above all economical to operate.

We invite consideration of various Brownell Numbers especially suitable for creamery requirements.

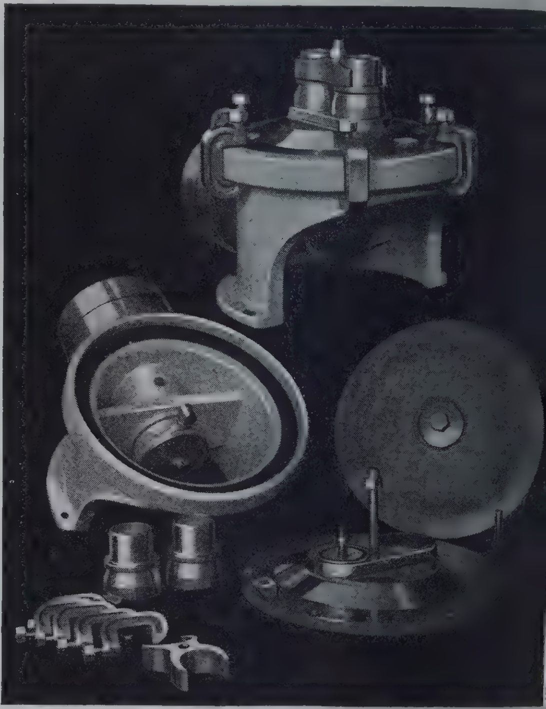
A NEW PUMP.

An English inventor has perfected a new pu signed for pumping water, milk, oil, beer, in fact all The patent for the pump is based on the use of diaphragm and any desired capacity can be obtaine multiple diaphragm principle.

A pump, the working parts of which are shown accompanying cut, was exhibited at the recent Londo Show, and the inventor was awarded a gold medal f the "best new invention." The pump on exhibit is ca



pumping 1,000 gallons per hour to a 50-foot head, a been demonstrated to suck from a depth of 28 to 30 f has no glands, no working parts being in contact w fluid to be pumped.

The inventor says that the pump can be taken a 30 seconds and assembled in 60 seconds. Less than one-half horsepower is required for its operation.

The inventor is looking for a suitable business con for the introduction of his pump into the United Sta other countries. If any of our readers are interest may get further details by addressing the Olsen Puls Co., Milwaukee, Wis.

JOHN P. McKINLEY NEW PRESIDENT RICE & A CORPORATION.

Announcement has been made by the Rice & Ada
poration, Buffalo, N. Y., of the election of John P. M
to the presidency of the company, succeeding the la
S. Adams. Mr. McKinley, who has been actively as
wih the company for the past twelve years, wit
quarters at Chicago, has now moved to Buffalo to ass
tive management of this large and well known organization.

JOHN P. McKINLE

The Rice & Adams Corporation is to be congratulated on their choice of the man who is to direct its future destinies. In addition to his unusually wide acquaintance among dairymen and the foremost figures of the dairy machinery field, Mr. McKinley has had a great deal of practical experience in the dairy and creamery business. His father was one of the pioneers in the cheese industry of New York State, and Mr. McKinley, therefore, has done everything from washing cans to managing plants in the handling of milk, butter, cheese and various other milk products.

This close association
with all phases of the dairy business has given him
perception of the mechanical needs of the industry.
equipped him to render authoritative advice in the s
and installation of dairy equipment for all purposes.

The Milk Dealer asked Mr. McKinley whether h
to make any statement to the dairy field as to his p
the future. His reply was brief, emphatic, typical
energy of the man.

He said: "Rice & Adams has one of the finest p
the country for the manufacture of dairy machinery.
built to give the dairy industry the best equipme
money, engineering skill, modern machinery and trai
chanics can produce. We are going right ahead doin

DE LAVAL SHORT COURSE IN FACTORY-SIZE SEPARATOR OPERATION.

Fifteen or twenty years ago the creamery or milk plant owner almost invariably operated his cream separator himself, realizing that it could be either the most profitable or most costly machine in his plant. The large milk plant or chain of milk plants of today precludes any thought of such operation and as a consequence the separator is all too often put under the care of a man who knows next to nothing about it. Even the manager himself has forgotten what he once knew about the machine and is sometimes only dimly aware that there is one in the plant until something goes wrong. All this is very flattering so far as the reliability of the modern centrifugal separator is concerned, but it is really not good business from the user's standpoint.

To help the separator user remedy this condition, the De Laval Separator Company a couple of years ago inaugurated the plan of inviting groups of creamery and milk plant managers and superintendents to the De Laval works at Poughkeepsie for a short course in the operation of factory-size separators, which, of course, includes also an inspection of the works. Several of the meetings have since been held, each lasting for three or four days, and each attended by some 20 to 30 milk plant representatives. The plan has proven to be of real benefit to the plant managers, as will be seen from the following program of a meeting just closed.

Creamery and milk plant representatives who attended the recent short course in separator operation at the De Laval Works, together with the De Laval men who acted as instructors.

The first day was devoted to an inspection of the works, and the succeeding ones were devoted to real work, the men donning work aprons and assembling and disassembling power machines and listening to instructive talks like so many engineering students. The evenings were filled with talks of what had happened during the day and swapping experiences of various kinds between the men in attendance.

This particular meeting was busier and perhaps of greater interest than those of the past for the men had the New Series power machines to work on and there was much to be learned about new forms of construction and new standards of skimming efficiency.

Following is a list of the companies and their representatives who attended:

Breyer Ice Cream Company: Wm. Keown.
H. P. Hood & Sons: G. E. Morse, M. R. Rexford, A. Loukes.
Chestnut Farms Dairy: W. R. Coppage.

Brown & Bailey Condensed Milk Co.: Jay Sargent.

Daniel Franklin: A. E. Jones.

Dairymen's League Co-operative Association: Messrs. W. W. Lewis, O. M. Lutes, R. E. Russell, E. R. MacLaury and H. S. Smith.

Waddington Condensed Milk Co.: J. M. Doyle.

Western Maryland Dairy: Messrs. O. B. Schier, John Parcell.

Merrell-Soule Co.: Messrs. E. A. Norton, Jas. H. Johnson.
Mitchell Dairy Co.: Arthur Mitchell.

Hershey Company: Messrs. N. J. Mohler, Wolf and Shertzer of Harrisburg, Pa.

LARGE OUTSIDE INTERESTS SECURE STO THE AINES FARM DAIRY.

The Charles F. Schwager Sales and Servic
concluded an interesting work in connection wi
industrial and management service, whereby a v
isfactory deal was consummated late in No
through the sale of a large block of stock in Th
Farm Dairy, Kansas City, Mo., to W. F. Labh
brother of Chicago.

Two new faces will be found in the future
ings of the milk industry. Both brothers will
active part in an official capacity.

The management, however, will remain in th
of Mr. Blain, who has been managing this dairy
the last few years.

The Labhart brothers have been very succe
their many undertakings not alone in the milk i
but other ventures. This should not only strengt
Aines Farm Dairy, but be a beneficial factor in
eral milk situation of Kansas City and the West.

⚜

THE CITY MILK STATION.

Dr. Lee Thomas, a supervisor in the Brookly
department, is quoted as having recently said:

"Babies who have come out of their early peri
healthy bodies need training under competent
tors," he declared. "Nursery schools solve thi
lem. At present there are two in New York whe
kiddies, too young for the kindergarten, learn to
their hands, teeth and take care of their bodies.

"When they reach the kindergarten age t
exceptional children. They have passed the
period of their lives under qualified guidance a
not frittered away time."

Dr. Thomas pointed out that baby milk stati
cut infant mortality in half since 1915. "Babi
because we did not know how to cope with diar
he said. "But now we know how to arrange
diets.

"Milk stations are a means of educating
rather than strictly feeding stations," he said.
ordinary doctor knows little about the correct
babies, and often does more harm than good. Th
department has two functions—police and educ

"The first is becoming less and less importa
soon the department will become exclusively an
tional institution, to see that babies are cared fo
erly and grow to be healthy adults."

MARYLAND DAIRY PRODUCTS MANUFACTURERS MEET.

A meeting to encourage better dairy products merchandising methods will be held by the dairy products manufacturers of Maryland on January 26, 1927. The meeting is scheduled at the Frederick High School building, Frederick, Md., and will be called promptly at 10 A. M. A good dinner at a nominal fee will be served at the building, and arrangements will be made to adjourn the meeting in time to permit the visitors to catch trains for an early return.

R. C. Munkwitz, assistant professor in dairying, University of Maryland, advises that this is the first meeting of its kind to be held in that state, the purpose of which is to "lay the foundation for the manufacturing and the merchandising of better dairy products in Maryland."

General discussion of plans will be the prime object of the meeting, although a small program has been arranged to form the basis for discussion. W. Horace Harper, secretary of the Baltimore Dairy Council, will discuss the "Activities of a Dairy Council." This will be followed by "Standardization of Plant Practices," to be delivered by DeVoe Meade, head of the department of dairy husbandry at the University of Maryland. "Merchandising Better Dairy Products" will be the subject of a talk by R. C. Munkwitz.

IMPROVED METHOD OF MILK DISTRIBUTION IN NAPLES, ITALY.

Consul H. D. Finley states in a report made public by the department of commerce that the city of Naples, Italy, is gradually forcing the owners of cow stables within the city to remove them to the suburbs. Hitherto cow stables have been permitted in the busiest as well as in the best residential districts of the town. The problem has never before been susceptible of solution because the populace have from time immemorial been accustomed to purchase their milk milked into their own receptacles at their front door. The people could not or would not trust the milk peddlers not to water or otherwise adulterate their products. Within the past two years two central milk distribution companies have been formed which deliver pasteurized milk, in sanitary containers, to homes, and this business is increasing at the expense of the trade of the former cowherds and goatherds who kept their flocks in the immediate vicinity of their customers' houses.

VITAMINES IN MILK ARE NOT DESTROYED BY PASTEURIZATION.

Pasteurization does not kill the vitamines in milk, states the Oberlin College physician, according to the Oberlin, Ohio, Tribune.

According to good authorities, milk contains all three of the most necessary food elements: Proteins—the tissue builder; carbohydrates—the energy builder; and a good supply of butterfat. The minerals necessary for nutrition are also present. In addition to these components milk, according to most investigators, is well supplied with the necessary food factors, the three well known vitamines, A, B and C. Pasteurization has no effect on vitamines A and B and does not completely destroy C. The latter is contained in large quantities in orange and other fruit juices.

Doctors state that the supply of vitamines A and B remain fairly constant in cow's milk throughout the year while vitamine C varies with the season. In the winter this accessory factor is reduced or entirely absent, but in the summer when the animal is enjoying fresh pasturage, vitamine C is abundant in the milk.

PASTEURIZED MILK SOLD IN CANS MUST B PROPERLY TAGGED IN NEW JERSEY.

The New Jersey State Department of Health has called to the attention of milk dealers a violation o pasteurizing regulation No. 20. This regulation sta "Containers in which pasteurized milk or crean shipped or delivered shall be plainly capped, tagge labeled 'pasteurized' and the said caps, tags or la shall show the location of the pasteurizing plant, name of the proprietor and the day on which the was pasteurized."

As far as bottled milk is concerned, the regula has been strictly adhered to, but in the case of past ized milk sold in large or small cans, tags comply with rule 20 have frequently been missing. Proprie of restaurants, ice cream factories, hotels and even i tutions have often not known whether they were rec ing pasteurized milk or raw milk, due to the absenc identifying tags.

KENTUCKY MERGER ANNOUNCED.

Announcement has been made by George S. Bel the consolidation of the George S. Bell Dairy and Dixie Dairy, both of Lexington, Ky., under the n "Dixie-Bell Dairy, Incorporated." Mr. Bell will manager of the new concern.

Preparations are being completed for the erectio a new dairy building in the city which will cost betw $50,000 and $75,000. For the present the dairies operate in their respective businesses. At the pre time the two dairies are handling 1,500 gallons of but it is hoped that as a result of the merger 3,000 lons of milk will be handled.

Following the filing of the articles of incorporat election of officers will be held.

GEORGIA TO HAVE MODERN DAIRY PLANT

Clarence E. Jones, architect, has just submitted p to the Arrowhead Dairy Farms of Chickamauga, for the erection of the largest and most modern d plant south of Baltimore. The plans as submitted i cate that the new unit will contain its own ice plant refrigerating rooms, cooling plants, separators, a matic bottle washing machines and sterilizers, all of latest and most modern design.

Frank Henderson, manager of the Arrowhead Fa has spent a great deal of time visiting the large eas dairies and the leading universities in search of ideas and the most recent developments concerning scientific handling of dairy products which are to b corporated in the new dairy. The new dairy is expe to be completed in the early spring.

OPEN TWENTY-FIFTH PLANT.

Beauty, sanitation and cleanliness seem to be dominant factors in the erection of a new buildin Cameron, Wis., by Abbotts-Alderney Dairies.

The new building will be 184 by 86 feet and ere in ornamental style, with the grounds beautifully l scaped and made to resemble a park. The grounds rounding the creamery and dairy plant occupy acres. This plant will make the twenty-fifth one w the Abbotts-Alderney Dairies are operating. Guy S is manager of the Cameron plant.

WANTED TO BUY

(Rate: 5c per word)

WANTED TO BUY—Second hand tu
cooler, capacity from 5,000 to 8,000 lb
hour. Wisconsin Milk Products Co.,
Mills, Wis.

DEFINITION FOR CULTURED SKIM MILK PROPOSED BY THE FOOD STANDARDS COMMITTEE.

The food standards committee has proposed a definition and standard for cultured skim milk, "cultured buttermilk," according to Dr. W. W. Skinner, chairman of the committee.

Criticisms and suggestions regarding the proposed definition and standard are invited from food officials, consumers, the trade, and all interested parties. Communications should be addressed to the Secretary of the Food Standards Committee, Bureau of Chemistry, Washington, D. C., and reach him not later than February 15, 1927.

The proposed definition and standard for cultured skim milk, "cultured buttermilk," is as follows:

CULTURED SKIM MILK, "CULTURED BUTTERMILK," is the product obtained by souring skimmed milk, or partially skimmed milk, by means of special cultures of the streptococcus lacticus type. It contains not less than eight and five-tenths (8.5) per cent of milk solids not fat.

⁂

VIRGINIA MILK PLANT TO OPEN.

A milk pasteurizing plant will be installed in Norton, Va., by H. F. Hube and Ed Fraley, according to plans now under way. The plant will have a capacity of 200 gallons of milk daily. Machinery is now being installed in the Dotson building on Seventh St.

The milk will be received from all sections of the county, pasteurized at the Norton plant, bottled and retailed in town by means of a delivery service.

Mr. Hube, who operates a dairy near Wise, will be manager of the new concern.

⁂

You cannot afford to miss a single copy of "The Milk Dealer." If you have not done so, be sure and send in your renewal today.

SCHOOL MILK SERVICE GROWING.

Mrs. Mabel Keef, representative of California
Council, who is in charge of milk service in the
Angeles city schools, has so organized and systema
the work that no deficit has been reported during
past two and one-half years. Mrs. Keef co-operates
the health and corrective physical education depart
of the schools, and with the nutrition department o
Parent-Teacher Federation.

Three years ago 80 Los Angeles schools held
classes. Today 239 schools have well established se
and, as a result, the children show improvement
mentally and physically. Realizing the need of mi
the diet, the P. T. F. has made itself financially re
sible for service to indigent children in 93 schools.

⁂

DECATUR UNION DAIRY EXPANDING.

A modern, two-story structure of brick, 68 b
feet, will be erected by the Union Dairy Co., Dec
Ill., at a cost of $35,000.

Increase in business made it necessary for the
pany to have larger quarters, and it was decided to
a new and modern building rather than attempt t
pand in its old location. It will be a modern, up-to
pasteurizing plant, with the best approved mach
and equipment. Twenty-six persons will be employ
the new plant, the same as at present.

⁂

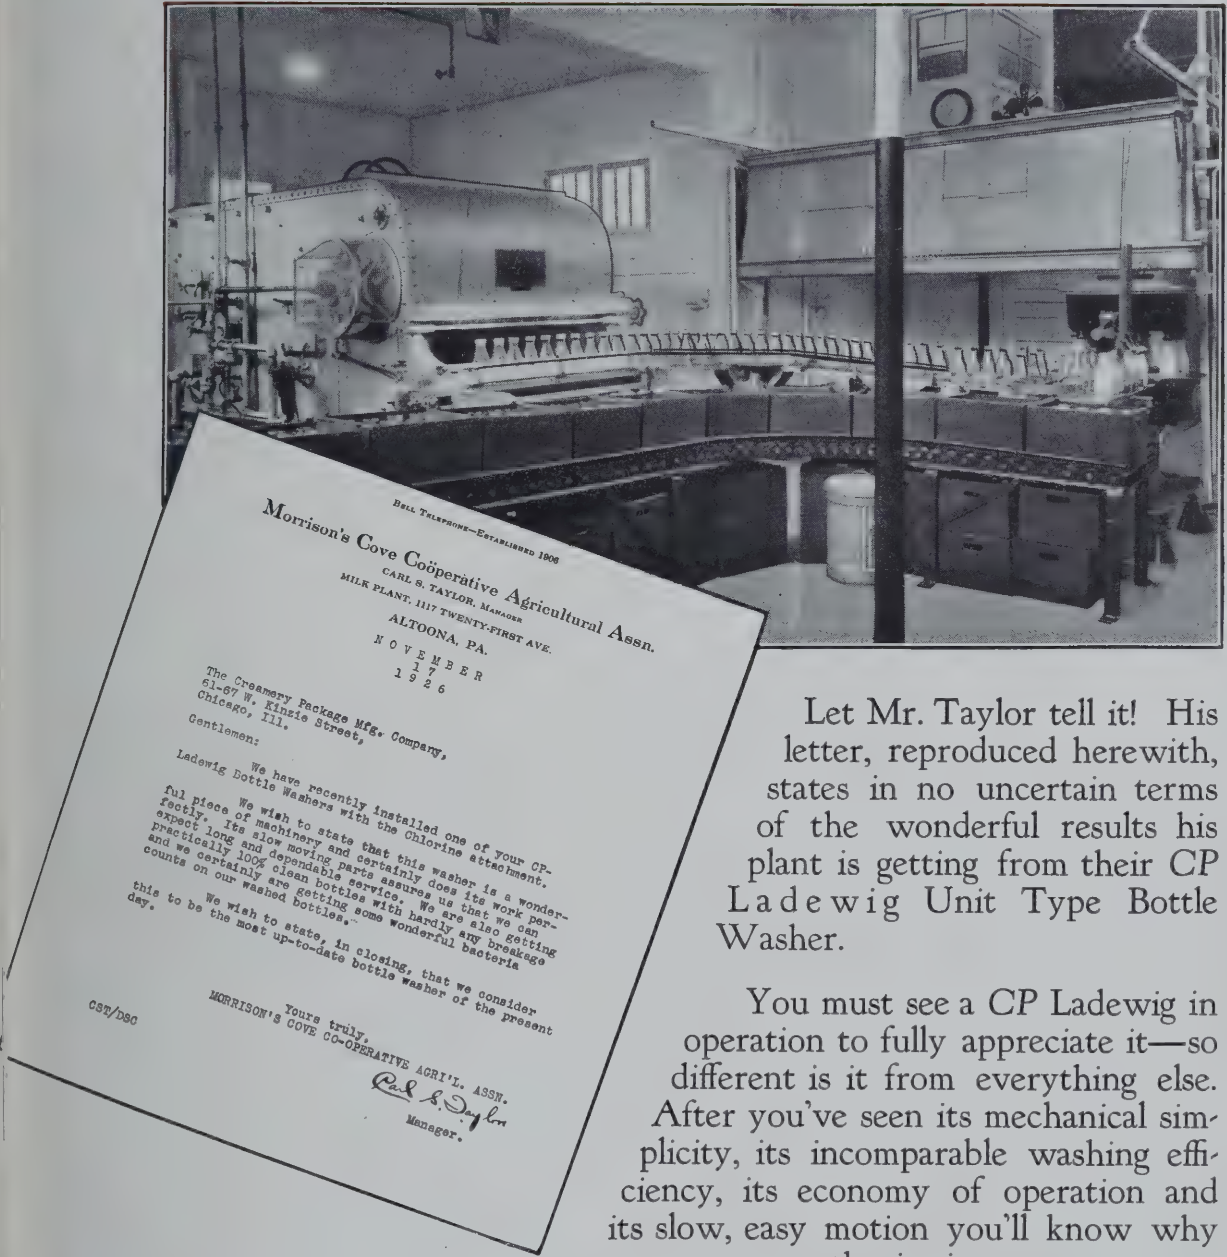
. . . . . the CP Ladewig is the most up-to-date ottle washer of the present day.'' —CARL S. TAYLOR



BELL TELEPHONE—ESTABLISHED 1906

Morrison's Cove Coöperative Agricultural Assn.
CARL S. TAYLOR, MANAGER
MILK PLANT, 1117 TWENTY-FIRST AVE.
ALTOONA, PA.

NOVEMBER
17
1926

The Creamery Package Mfg. Company,
61-67 W. Kinzie Street,
Chicago, Ill.

Gentlemen:

We have recently installed one of your CP-Ladewig Bottle Washers with the Chlorine attachment.

We wish to state that this washer is a wonderful piece of machinery and certainly does its work perfectly. Its slow moving parts assures us that we can expect long and dependable service. We are also getting practically 100% clean bottles with hardly any breakage and we certainly are getting some wonderful bacteria counts on our washed bottles.

We wish to state, in closing, that we consider this to be the most up-to-date bottle washer of the present day.

Yours truly.
MORRISON'S COVE CO-OPERATIVE AGRI'L. ASSN.
Carl S. Taylor
Manager.

CST/DSC

The hook-up between washer and filler as used in this plant effects great savings in labor costs as well as speeding up the work materially.

Let Mr. Taylor tell it! His letter, reproduced herewith, states in no uncertain terms of the wonderful results his plant is getting from their *CP* Ladewig Unit Type Bottle Washer.

You must see a *CP* Ladewig in operation to fully appreciate it—so different is it from everything else. After you've seen its mechanical simplicity, its incomparable washing efficiency, its economy of operation and its slow, easy motion you'll know why users are so enthusiastic.

Write for a copy of Bulletin 1131 which gives full details.

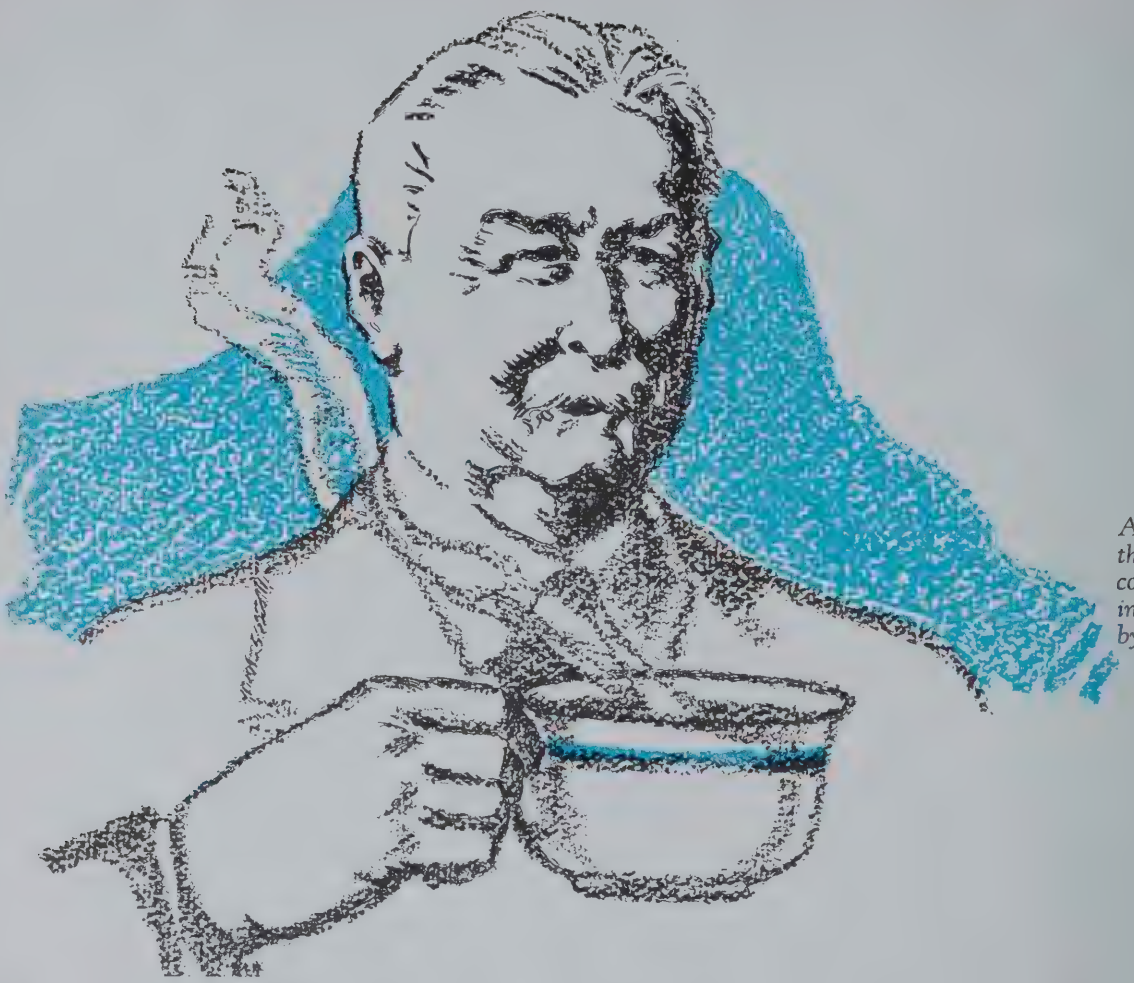
THE MILK DEALER

THE LIBRARY OF THE
FEB 28 1927
UNIVERSITY OF ILLINOIS

WISE BROTHERS

Volume 16 FEBRUARY, 1927 Number 5



A new milk drink with the invigorating tang of coffee; zippy and refreshing; wholesome and liked by everybody.

Increase Your Sales with Coffee-Milk---Popular Everywher

Every day will bring you dozens of new customers for COFFEE-MILK in offices, shops, stores and homes.

Everyday more milk dealers are selling Coffee-Milk, and making extra profits. Coffee-Milk is a great leader. It will help your driver-salesmen to get new accounts and keep them. Your old customers too will enjoy this zippy and wholesome drink. It is easy to make and easy to keep. Just mix milk with Arabian Brand Coffee Syrup—no trouble at all.

Made from full flavored, fresh roasted coffee, highly concentrated in syrup form. Easy to mix with milk; no equipment necessary. Never settles at bottom of bottle; no sediment. Write for prices and sample.

D. ABELSEN & SON, - - Providence, R. I.

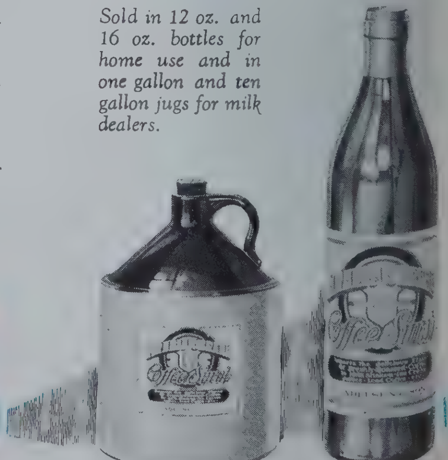
Central States Representative: M. C. DRESHFIELD, 405 East Main St., Kalamazoo, Mich.

To insure prompt reply when writing for samples or information, address direct to factory.

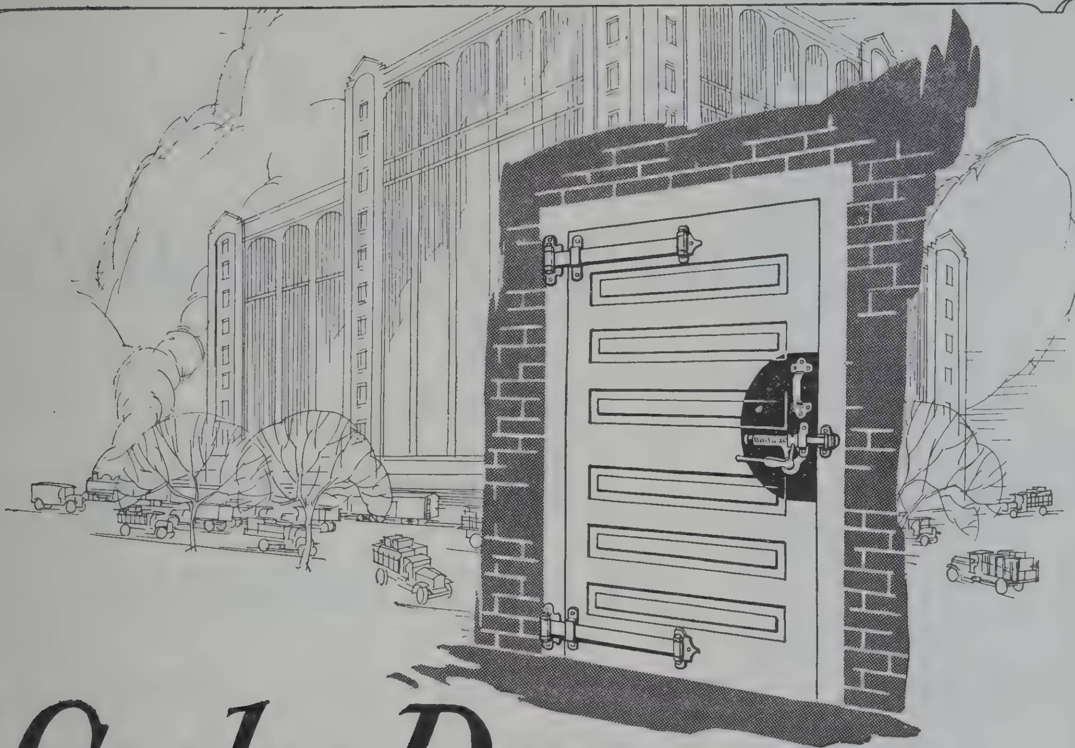
ARABIAN BRAND

COFFEE SYRUP

Sold in 12 oz. and 16 oz. bottles for home use and in one gallon and ten gallon jugs for milk dealers.



FACTS ABOUT COOLER DOORS ~ No. 1 of a Series



A Cooler Door is "only as good as its hardware"

Jamison Doors
Jamison Cold Storage Door Co

Send for new Catalog No. 13, giving complete information on Jamison Cooler and Freezer Doors, Automatic Ice Chutes, and other Jamison Products.

Look for No. 2 of this
ERIES on Page 63 of
his issue.

NO matter how well insulated and constructed a cooler or freezer door may be, it cannot give proper protection against air leaks, if the hardware is weak or inefficient.

That is why every Jamison Door is hung with specially designed, over-size hardware, far heavier than the hardware used on other doors.

The inevitable wear and tear of service bring no air leaks or temperature losses around a Jamison Door. For the pressure of the steel spring underneath Jamison Hinges can be adjusted by the special set screw with which it is fitted. Just a turn or two of this screw at any time increases the pressure, so the door is again held as tightly against its double seals of contact as the first day it was installed.

And, the fastener on Jamison Doors always works. Slam the door, bang it, or just push it. No difference! The Jamison Self-Tightening Fastener grips the door and holds it fast —air-tight, leak-proof.

There are many other important features that have won for Jamison Doors their outstanding reputation for dependable, low-cost maintenance. Send for catalog giving the whole story.

nder perfect control

IN THE Prest-O-Lite Gas Torch you have a torch that is under perfect control. Open the valve of the Prest-O-Lite Tank not more than a quarter turn, usually less, ignite and instantly you are ready to work with flame of the size and temperature desired. You can direct the heat exactly where you need it without undue heating of nearby parts. Your control is perfect, down to a fraction of an inch.

Factories find the Prest-O-Lite Gas Torch produces unusual economies. It speeds up production, and its absolute uniformity reduces waste and spoilage.

Individual workers, skilled or unskilled with the old-fashioned type of blow torch, quickly prefer the Prest-O-Lite with its instantly ready flame. It burns Prest-O-Lite Gas, familiar to all through its use in motor-truck headlights. Available in several sizes of portable tanks. Empty tanks exchanged for full ones at any one of the thousands of Prest-O-Lite Gas exchange stations, for small cost of gas only. Write us for full details, naming the kind of work you do.

Where Experience Buys—

Results are what count with business leaders like these. When they buy trucks, they invest money farsightedly in order to secure the greatest return. That these firms—and scores of others equally well regarded—continue to reorder more and more Walker trucks, indicates the result of their experience—

Trucking and deliveries in closely populated areas require Electric trucks—and Electric trucks means Walkers.

Ask us about the Walker's 16 money making and money saving advantages in city traffic, also names of Walker users in your own line.

Order Walkers now!

Everything for the Dairy Industry

The New Mayfair Plant of the Bowman Dairy Co.

Barber-Goodhue Service and the new Mayfair Plant of the Bowman Dairy Company

VISIBLE expression of the broad scope and th high efficiency of Barber-Goodhue service i exemplified in a most impressive way in th wonderful new Mayfair plant of The Bowman Dair Company of Chicago.

Two 12,000 Pound Simplex Pasteurizing Outfits

In this modern plant—one of the largest of its kin in existence—we have furnished complete Burrell Simplex pasteurizing equipment, a battery of 6 Mil waukee fillers, Barber-Goodhue Skim Milk Foan Eliminator, and equipment for the two receivin rooms. All of this important equipment was choser with extreme care as the most efficient, speedy long-lived apparatus available.

One Burrell-Simplex pasteurizing unit which has beer serving under the most exacting conditions for th past eleven years in one of Bowman's country plant was transferred to the new Mayfair plant. Wha better evidence than that could possibly be given demonstrating the dependability, long life, and con tinued efficiency of this equipment?

If you contemplate building a new plant—if you want to remodel the old one—if you are thinking about purchasing new equipment or supplies of any kind, by all means depend upon Barber-Goodhue for conscientious, top-notch service, and for utmost satisfaction. Write us about your requirements today.

General Electric Company,
111 E. Third Street,
Davenport, Iowa.

Gentlemen;

We have had quite a large number of your 900 series motors since you started to manufacture them and believe they are a decided improvement over all other motors that we have had any experience with.

Of all the motors we have sent out there have been only two complaints come to the writer's attention, both of which, upon investigation, proved to our satisfaction that the trouble was not the fault of the motor in any way.

It is considerable satisfaction, to the manufacturing department especially, to be able to equip our machines with the 900 series motors and be free from motor complaints. In our opinion they are the most satisfactory motors for our machines of all motors we have tested.

Yours very truly,

J. G. CHERRY COMPANY.

D M Taylor

Fcty. Mgr.

In addition to the above letter the J. G. Cherry Company writes:

"One of the most recent and largest installations is the plant of the Southern Dairies at Miami, Florida, which is a combined milk and ice cream plant.

"Another large installation, of course, is that of the Chestnut Farms Dairy, at Washington, D. C., the Breyer Ice Cream Company, at Philadelphia, the Seattle Ice Cream Company, at Seattle, Wash., the Dallas Milk Company, Dallas, Texas, Armour & Company, who have specified on a recent order given us for twenty-four Dreadnaught Churns and seventeen Class "L" Pasteurizers that they shall be direct motor driven, and they will, of course, be equipped with General Electric motors."

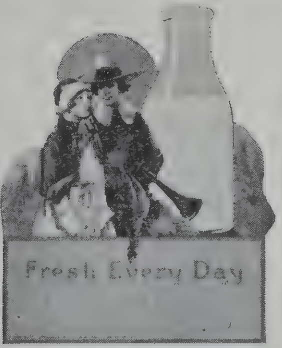
YOUR DAIRY COMPA
DAIRY COMPANY
MILK

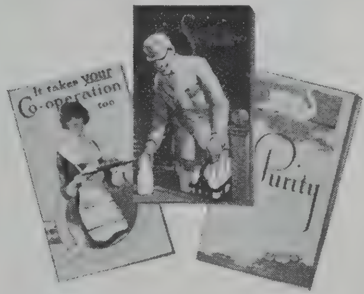
Giving YOUR BUSINESS a Personality —



Fresh Every Day

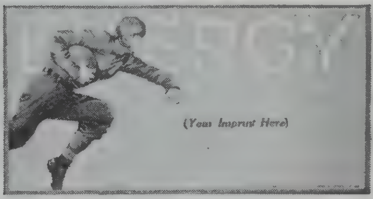
ON the loading platform of your plant it is "*your milk*"—is it still "*your* milk" when it reaches the homes of your customers or is it just "milk"?

The answer to that question depends entirely on whether you preserve your identity clear through to the homes you serve. And it's a mighty important question because millions of gallons of milk flood the cities of this country every day. And if you're spending money to get good milk and to give good service, you can't afford to submerge the personality of your business in the daily Niagara of milk that pours out over the country.



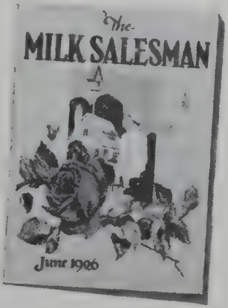
It takes your Co-operation too
Purity

That's what advertising is for.



ENERGY
(Your Imprint Here)

Never mind now about education. The purpose of advertising isn't to educate—it's to sell goods. And you can use it, if you like, to make *your* milk stand head and shoulders above the common level.



The MILK SALESMAN
June 1926

Let us tell you how we are helping other dealers do this job. We've had a lot of experience in the milk business. We know the milk man's message and the milk man's market. Maybe we can help you. Drop us a card.

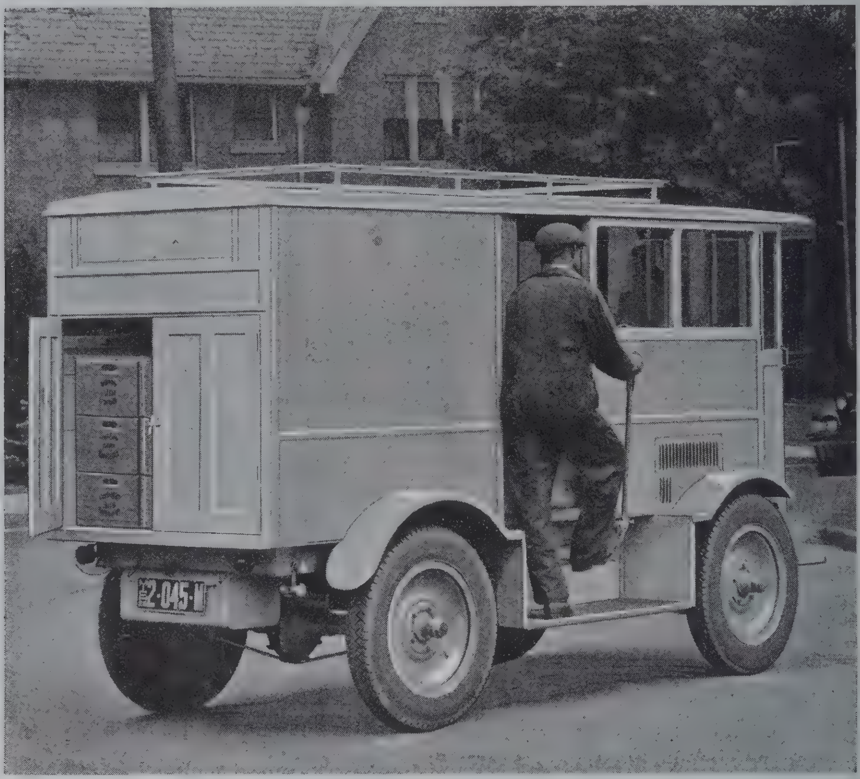
DIVCO THREE POINT CONTROL TRUCKS

The only Truck designed and especially built for

RETAIL MILK DELIVERY



Capacity
50
Cases

Rack for
Empties
on Top

Prominent Features over any other Gas Truck

1. **Three Point Control**

   Easily operated from either running board or front seat. Making multiple stop delivery quicker — more economical — more efficient than conventional type Gas or Electric trucks.

2. **Economy of Operation**

   Perfect idleing slow speed motor.

   Gas Milage, 18 to 20 M. P. G. on straightaway—7 to 10 M. P. G. on house-to-house delivery—motor running continuously.

   Oil Mileage averages 800 M. P. G.

3. **Long Life**

   Special slow speed motor, governed to 18 M. P. Hour. Every necessary part oversize. Extra large clutch and brakes designed for Multiple Stop delivery.

4. **Small Turning Radius**

   Divco turns in 4 ft. smaller circle than a Ford.

5. **Power**

   Divco will economically negotiate any road where it can get traction—giving it larger cruising radius than other trucks.

6. **Quietness**

   Practically as noiseless as an electric.

7. **Storage Space**

   Overall length, 79 inches. This means less garage investment.

8. **Looks—Advertising Advantage**

   Trim—well balanced—low in appearance—quiet in operation.

9. **Ease of Operation**

   Quick—smooth acceleration from either running board—easy steering—positive fool-proof brakes.

10. **Saving in Collections and Soliciting New Business.**

OFFICIAL ORGAN OF
The International Association of Milk Dealers
Dairy Products Association of Kentucky, Inc.

FEBRUARY, 1927

BULLETIN *of* EVENTS

Dairy Products Association of Kentucky—Final meeting of the spring and summer season will be held in Cincinnati, O., on Wednesday, April 21, at the Gibson Hotel. Carlton Ball, 206 Republic Bldg., Louisville, is general secretary.

Dairy Industries Exposition—The second annual exposition of the Dairy and Ice Cream Machinery and Supplies Association will be held at Cleveland, Ohio, on October 24-29, inclusive.

MILK dealers the country over are building the industry on a sound basis; that is, the majority are so building. They appreciate the importance of high quality products and good service to their customers. The cynic might add that competition forces them to recognize the importance of these two things, but even so the fact remains that they are building well because of it.

In many communities they are doing another thing well that influences the progress of the industry's development. They are working together to improve quality and give still better service. They are employing constructive competitive methods instead of the destructive kind.

This is particularly true in the larger cities. There is a reason, we believe, why we find co-operation working out best in the larger cities. There are enough far-sighted ones in one community to make a co-operative effort possible. They generally represent a large share of the business done in that community. They are big enough and strong enough to work together and the field is big enough to permit of intense co-operative effort. They get results and they don't worry about the little fellows who are not willing to travel alo them.

In some of the smaller cities and towns one fi milk dealers working together, but they are exc In the town of 10,000 or 15,000 inhabitants, for i one usually finds a progressive dealer with a consi share of the business and several little fellows a him, and perhaps quarreling among themselves same time.

It's difficult to get the leaven of co-operation t ing in such a place. Seed sown there will n sprout, as a rule.

We don't know how to change conditions in community except to keep on talking about the tc come to men in the same line of business thro cperative effort. Some day they will see the lig as men in other communities have seen it.

❧

MEN in the milk business, in fact any branch dairy industry, whose business has not been ed by city ordinances requiring that all milk mu from tuberculin free cows should not feel too Food control officials have a habit of working t and exchanging ideas. They generally figure th one can do another can do. And what greater tion can a public official meet up with than the tunity to "clean up" the milk supply of his const

The danger of using milk from tuberculin i areas, when properly pasteurized, has, of cours greatly exaggerated. If there were the dang sensational reformers would have us believe th human race would have been wiped out long ag that fact does not alter the situation.

The fact remains that it is a good thing for th industry to eliminate tuberculin infected cattle rapidly as possible. When a food control official tuates the process of elimination by laying down rules it is the course of wisdom for the milk de other dairy products manufacturer to co-opera him.

The elimination process may work individua ships, but when the job is done it is mighty fine tising for the industry when it can be officia nounced that the milk supply of a certain area i suspicion. So far no food control official has. knowledge, required dairy products other than milk to come from tuberculin free areas, but the coming when all dairy products the country o be included.

It seems wise for dairy products dealers and facturers everywhere to join hands with the m agencies that are promoting sentiment in favor tuberculin test. There are many farmers oppose Their opposition is based mostly on ignorance of i fits to them and to the industry.

Some men in the manufacturing end of the i help the opposition by the same sort of ignoranc some cases, to please their farmer patrons. Such is short-sighted, to say the least.

E ARE sure our readers will profit by reading an article published in this issue, relative to the use atine in the manufacture of buttermilk. The atti- of various city officials is interesting, in view of the hat health experts agree on the food value of ne.

e investigation carried on by The Milk Dealer, and will be continued, reveals a woeful lack of infor- n on the part of food control officials relative to ed buttermilk as well as gelatine. The majority however, that gelatine may be added if the fact ed on the bottle cap.

ese same men seem to feel that cultured butter- s inferior to “churn” buttermilk. They seem to that buttermilk sales never reached a respectable in any city until cultured buttermilk was put on rket, and then not until cultured buttermilk was right and uniform in quality. Under modern but- king methods it is absolutely impossible to produce n” buttermilk of good, uniform quality. There e demand for it and it is impossible to build up table sales volume on it.

e demand for cultured buttermilk depends on the y and uniformity of the product put on the market. addition of a small amount of gelatine will assist lk dealer to put out a better and a more nearly m product he should be encouraged to do so by s whose duty it is to do everything they can to e the food supply of their people.

* * *

ST milk dealers are so situated that they can manufacture butter to advantage. Many maintain making departments, but more purchase the but- their trade.

y should they? Why not buy cream as well as the territory and make butter? Why not thus the quality of your butter and make more money? rse, if there is no butter made in your city then ipply of butter must be shipped in, but if there or more creameries in your town then you can am just as easily as the creamery can buy it.

e milk dealers have tried it out and given up the a bad one. The most of them didn’t go into the s on a sufficiently large scale. They attempted ly supply their retail trade. That doesn’t mean enough except in the case of the big dealer. The go into the creamery business is to buy all the ou can get, regardless of the quantity of butter d for your routes. Make your creamery depart- and on its own feet and make you money. There s a market for good butter.

, you folks who have tried it out, please write us how bottling milk and making butter mix.

* * *

city business man gets up on a cold, frosty morn- , rubs his eyes and looks out upon the street and sees two or three milk wagons parked along the hile the salesmen are making their deliveries to nearby homes. “What a waste!” he exclaims as he sits down to breakfast and eats his bacon and eggs and drinks his coffee.

He proceeds, perhaps, to regale his wife with a dissertation on the subject of wasteful distribution in the milk business. “Why should three or four milk men be necessary to supply the people in this block with milk?” he asks his sympathetic spouse, and her silence pleases him.

This city business man may be in the retail business, but he forgets that for every staple product sold to the folks in that block there are fully as many, or more, competitors delivering goods in that block than there are milk men. Why jump on them? Who wants to see a monopoly in the milk distributing business? No one, except some fellow who doesn’t study the distribution problem clear through.

* * *

THERE is a lot of hard work to do before the men in this industry can enjoy the benefits that might come to them. The time will come when everybody in it will recognize that only through co-operative effort can they enjoy the maximum of benefits.

The big men in the industry who are supporting and promoting the agencies that are but slowly building up confidence and good will for the dairy industry are in the minority. We are not measuring men by the size of the business institutions they represent, either. There are some real big men in this industry connected with comparatively small concerns, and there are some mighty small ones associated with some big concerns.

Yes, the time will come when we shall see a more enlightened body of business men connected with the dairy products manufacturing plants. The minority will grow into a majority and then we shall see this industry dignified and put on a basis of service and salesmanship worthy of its importance to society. We may have to wait a long time, but the day will arrive just as it has arrived for some other industries.

Then we shall see men get together to plan big things for this industry. They will think and plan in terms of industry instead of in terms of selfish gain. They will have learned that a business prospers most when it serves best, and they will hunt for ways to co-operate instead of hunting for excuses to dodge it.

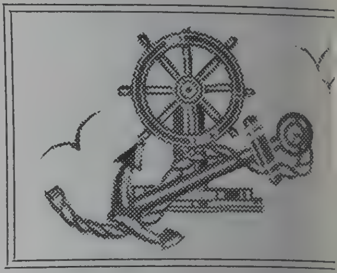
* * *

INCREASED consumption of milk means an increased demand for everything that the milk dealer uses in the production of that milk.

A prominent manufacturer of milk bottles, for instance, spends good money for advertising space in a popular magazine to emphasize the food value of milk. Returns will come in larger sales of milk bottles to handle larger sales of milk.

This is what we term “enlightened selfishness.” It helps the man or the firm who helps his customers to build up their sales. It is “bread cast upon the waters” which is sure to return.

Yo Ho-Ho and a Bottle o —Milk



When Wisconsin Folks Christen a Ship They Do It With Milk In Spite of the Fact That In Days Gone By They Produced the Stuff That Made Some Other Folks Jealous

EVER since men have been "going down to the sea in ships" tradition has decreed that each new craft shall be started on its career of usefulness by appropriate ceremonies. The breaking of a bottle of wine over the prow of the ship has for many long years been accepted as the proper nucleus for such ceremonies.

It has remained for Wisconsin folks, assisted by some friends from other places, to smash tradition and use the product of the cow in place of the product of the grape for that important ceremony. What is more fitting, they decided, than to christen a Wisconsin made ship by breaking a bottle of Wisconsin made milk? Such an innovation was in the nature of a testimonial to the state's fame as a dairy section.

About 200 railroad officials, dairymen and representatives of the shipbuilding corporation went to Manitowoc, Wis., on a special train Wednesday morning, January 19, from Milwaukee, where at 11:30 A. M., Miss Marian M. Dixon, daughter of George Dixon of Chicago and one of the directors of the Grand Trunk Railway, was given the honor of this first place in history. Promply at 11:30, Miss Dixon raised the bottle of milk, crashing it against the side of the steel ferry, "I christen thee 'Madison.'" Everything worked perfectly and the milk pouring down the side of the huge boat, and with a cheer from the assembled officials, the ferry launched down the ways, at first seeming to the uninitiated that she was going to turn turtle, but soon righted herself majestically as though she was proud of her distinction that had thus been conferred upon her in history-making event.

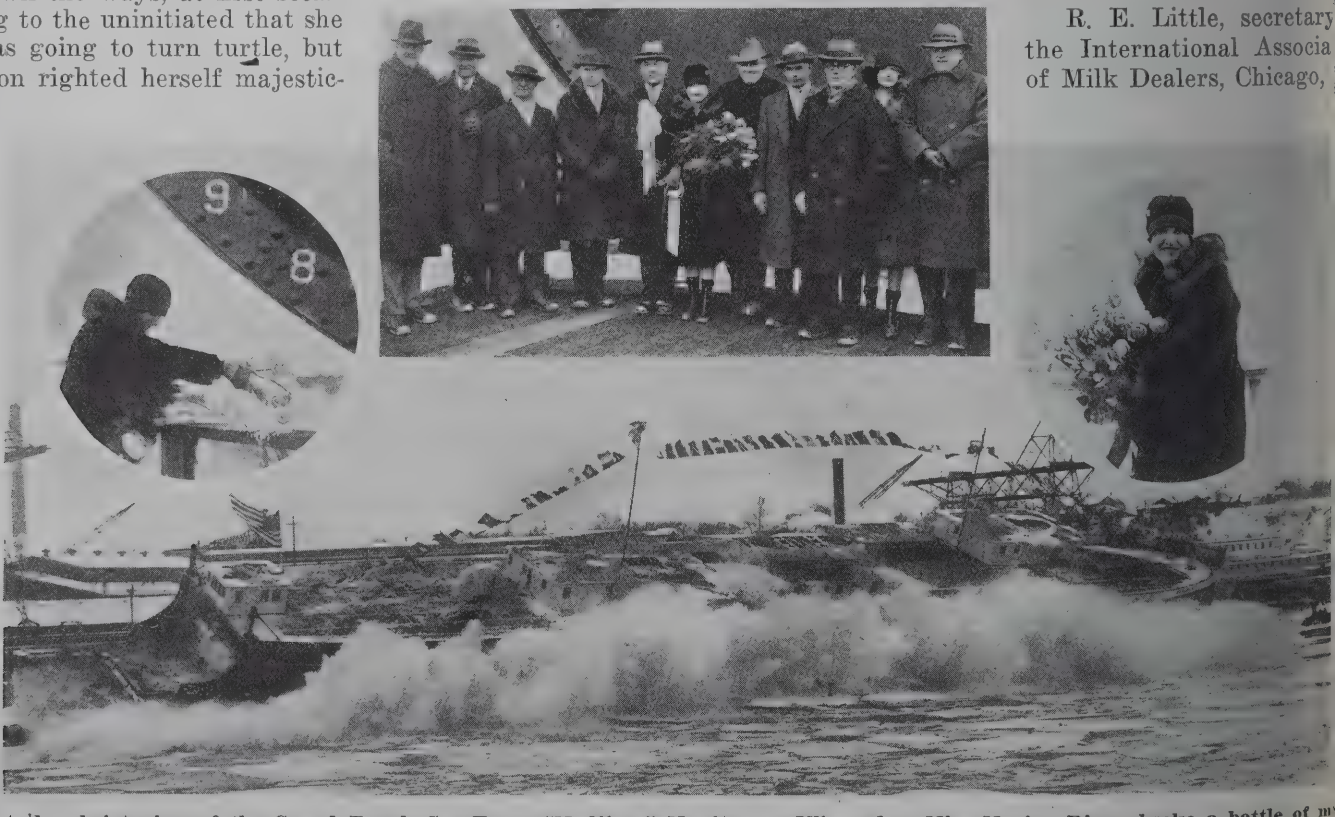
Following the launching, a luncheon was held at Manitowoc Elk's Club at which officials of the road shipyard corporation as well as several Milwaukee spoke. John LeFeber, president of the Gridley D Company, Milwaukee, announced that the fluid use christen the ship was representative of the state's tire dairy industry, having been composed of milk ta from five breeds of cows.

The "Madison" will carry 30 of the largest typ freight cars and is also suitably arranged to carry class passengers and automobiles.

The "Madison" is 300 feet over all, 56 feet in mold beam, 21 feet 6 inches depth of hold and 17 6 inches from car deck to saloon deck. The gross nage is 2,942. The net tonnage is 1,488.

Much of the credit for the success of the funct from the dairymen's standpoint, is due Mr. LeFe He conceived the idea of thus recognizing the sta leading agricultural industry and, by enlisting the port of the Milwaukee Association of Commerce, gained the consent of the Grand Trunk officials to violate the age old custom of christening ships wine.

R. E. Little, secretary the International Associa of Milk Dealers, Chicago,



At the christening of the Grand Trunk Car Ferry "Madison," Manitowoc, Wis., when Miss Marion Dixon broke a bottle of m over the bow of the vessel.

f the moving spirits in making the function a suc- and he seemed to take special delight in helping ash tradition and to back up his .friend LeFeber, is one of the past presidents of the International. his brief talk at the Elk's Club luncheon Mr. Le- r said:

> r. Chairman, Ladies and Gentlemen: The christening great ship with milk, as was done here today, is indeed que and momentous event in recognition of Wisconsin's dairy industry.
>
> or many years it has been my ambition to have all new that are launched, particularly in this state, christened the fluid that means so much to the industrial welfare isconsin, and equally as much, or more, to the welfare people of this state, and the building of the nation.
>
> everal years ago, when I first suggested this idea to iends, they seemed to think that I could not be serious. t, they thought it was only a joke.
>
> o me it always seemed a serious matter, and I can see ason why I was not justified in making this request ne authoritative body.
>
> fter long consideration, I finally brought the matter e the board of directors (of which I am a member) of Milwaukee Association of Commerce. I argued with that it would be a great opportunity for this business- s organization to do something in recognition of our e in the rural districts in Wisconsin, and, particularly, e man back on the farm, who, in my opinion, has never recognized by the business people as he should have
>
> his seemed to appeal to the board of directors as an tunity of helping the dairy farmer of Wisconsin boost very essential product.
>
> he result was that a resolution was drafted and unani- ly adopted, and through the splendid efforts of Phil ring and Harry Bell, president and secretary of the aukee Association of Commerce, who brought the mat- efore the Manitowoc Shipbuilding Company of Man- c, Wis., they were granted the privilege to christen the ship which was to be launched, and today we are cele- ng, as I have stated before, this momentous event in tening the ship "Madison" with milk in recognition r great state industry, which I assure you will be highly eciated by all of the people of this state.
>
> conclusion I personally want to thank the officials of anadian National Railway, and the Grand Trunk Rail- and the management of the Manitowoc Shipbuilding any, for having given our Wisconsin people this splen- ecognition.

J. W. RICE ELECTED PRESIDENT PENNSYL- ANIA ASSN. DAIRY AND MILK INSPECTORS.

t the third annual convention held in Pittsburgh, Dr. J. W. Rice of the faculty of Bucknell University elected president of the Pennsylvania Association airy and Milk Inspectors.

r. Charles H. Miner, former state secretary of h, Surgeon Charles Armstrong of the United States ic Health Service, and H. B. Dugdale, vice-presi- of Green Van Sant Company, spoke on subjects nent to dairy and milk inspection.

homas W. Henderson, secretary of the Washington d of Health, was the originator of the association the first president.

he association, by its earnestness and stability, as- g permanency, is attracting more and more the ic's attention; it is contributing in large measure ild welfare by safeguarding the milk supply, and also educating the public to use more milk and to and that this milk be free from all impurities and disease germs.

M THREE TO 7,000 BOTTLES OF MILK A DAY.

When A. D. Grieves of Inglewood, Calif., began busi- eight years ago his first day's sales amounted to bottles of milk. He has just opened a new $30,000 t, with F. E. Bolger as a partner, which new plant a capacity of 7,000 bottles daily.

he new plant is one of the most modern and com- in that section of the country.

KENTUCKY MANUFACTURERS MEET IN LEXINGTON.

The winter meeting of the Dairy Products Association of Kentucky, an annual event in compliment to the farm and home convention of the College of Agriculture, was held in Lexington, at the Phoenix Hotel, Thursday, January 27, with an attendance of approximately 60. About 30 guests were present from Ohio and Tennessee.

The meeting convened at 12:30 p. m., with President Chas. G. Vahlkamp presiding. John Kloecker, Sr., expressed the city's welcome to the visitors. The routine of the general session was dispensed with and that time devoted to impromptu remarks by Fred Rasmussen, secretary, National Association of Ice Cream Manufacturers; Harry A. Cuscaden, president, Southern Association of Ice Cream Manufacturers; W. A. Wentworth, general secretary, Ohio Dairy Products Association; J. H. Cline, president-elect of the Ohio Association of Ice Cream Manufacturers, and W. B. Wilkerson of the Nashville Pure Milk Company.

These talks were followed by divisional group meetings. The ice cream manufacturers discussed a proposed sanitary grading system for ice cream plants, ice problems, the corn sugar question and national advertising.

The creamerymen gave their attention to a tentative report of a cream grading committee, which was empowered to continue its work toward making a final report at the next meeting in March. J. D. Foster, inspector in charge, creamery license section of the experiment station, presented some suggested changes in the rules and regulations governing cream stations, which were endorsed by the creamerymen, with the exception of a few minor details.

The milkmen, having no special problems before them, joined in the meetings of the other groups.

As was previously announced, this winter meeting of the Kentucky association and the Ohio annual convention were so arranged as to give the manufacturers of each state an opportunity to exchange hospitalities and to get a closer insight of the particular problems in each state. A representative group of Kentuckians attended the Ohio convention in Cincinnati on January 25 and 26, and returned to Lexington with a car load of Ohio visitors.

The advantages of the close relationship of state associations, exemplified by the exchange of visits of the Ohio and Kentucky manufacturers, were emphasized throughout the day, and, in accordance with this thought, the Tennessee manufacturers invited all present to come to Tennessee at some future date to be announced later.

With the announcement that the next meeting of the Dairy Products Association of Kentucky would be the annual business meeting and the election of officers, Wednesday, March 9, Kentucky Hotel, Louisville, the meetings were adjourned to attend the annual farm and home convention banquet which immediately followed.

WHY SHOULD WE USE BUTTER?

Dr. E. V. McCollum, head of the school of hygiene and public health at Johns Hopkins University, gives the following reasons why people should eat butter:

"It is the best food source of the substance (vitamine A) for health and growth.

"It is a good source of fuel for work and heat.

"It is one of the most digestible of all fats.

"Its flavor improves the palatability of the diet.

"Since butter is a highly concentrated food, its chief value is in combinations with vegetables, bread and butter, and in cooking."

The International Cost Accounting Syste

What Uniform Cost Accounting Will Do for the Fresh Milk Industry

By W. B. CASTENHOLZ*

THE subject that I am going to speak about tonight is also international. I know no reason why national boundaries should in any way influence our concepts and reactions tonight as regards cost accounting. Certainly you who have followed the progress of cost accounting in this country and elsewhere in the last decade, will realize that it is one of those common sense applications to business that is needed in order to stabilize business. The work of standardization being undertaken by the United States government is a legislative cost accounting proposition; just as you are standardizing the sizes of your bottles, just as you are attempting to have the manufacturers of dairy machinery standardize their products, so that you will get the best results out of the machinery, so also, is it necessary for you to think of that other business equipment in your institutions, your cost accounting system. It seems to me that that will, in the last analysis, summarize the effect of all of these other standardizations. In 1915, about 11 years ago, Mr. Hurley, of the Federal Trade Commission, published a book called the "Awakening of American Business." There are some very significant passages in that book. That book is well worth reading today, even though we might consider it somewhat antiquated, because there has been considerable progress made in the subject of cost accounting. At that time, and in that book, Mr. Hurley deplored the fact that in the United States, probably less than 10 per cent of the manufacturers knew what it cost them to manufacture and distribute their commodities. That was truly a serious indictment against American business. At the same time he commented upon the extent of such information abroad. I think, in this work, he mentions specifically the progress that had been made along those lines in Germany. He indicated that in Germany, at the time, about 90 per cent of the manufacturers knew what it cost to manufacture and distribute their commodities. There is a reason, of course, why we have not developed in this country along these lines as rapidly as they did abroad. In the first place, there is the pressure of population on the continent, which forces them to adopt methods which would lead to greater economies, and to more standardized business conditions. But right there is the kernel which lies in back of the objects of cost accounting. Cost accounting is a standardization. In other words, it goes back to the rockbound dictum, that "knowledge is power," and that you cannot effectively operate your business unless you know in dollars and cents exactly what the different factors in your business, in trade, are costing you. In other words, the adoption of sound cost accounting system will permit you to put cream into your surplus account instead of skim milk.

Now, let us analyze the situation and just see what uniform cost accounting does for business. In the first place, it teaches this great lesson, which you apparently are learning, or which you apparently have already learned, the great lesson of industrial co-operation. That lesson is being taught and adopted all over the country. It is the lesson that the United States Department of Commerce is spreading. It is the lesson that your standardization committee is advocating. It is the lesson that other factors in business are strongly advocating. For example, the American Arbitration Association is advocating co-operation, rather than fighting, rather thar
norant competition. In other words, we must hav
knowledge of costs, costs applied not only to your pla
but to your distribution problems in order to make
petition intelligent. Cost accounting makes competi
fair; it does not kill it; it puts it on a higher plane
raises the man that is apparently unprepared, at time
hold his position in the industrial strife of today.
is eminently displayed in the progress that has
made in cost accounting as it has been adopted in a
form manner by various trade associations.

The printers' trade is an outstanding example of
successful application of uniform cost accoun
methods. Not many years ago, the printers, through
United Typothetae, the national organization, felt ra
flattered that they had a fund of $61,000 a year w
they could devote to this subject of standardized cos
counting and of securing its adoption by the membe
that association. At present, that association has a
able about a million and a half dollars in connection
its work of standardization of costs. What has happe
in that industry, and what is bound to happen in any
dustry that adopts the same intelligent method of
forming itself of what is going on in business? Be
the adoption of a uniform system of cost accountin
the United Typothetae of America, the printers' t
was near the bottom of American business, as fa
financial integrity was concerned. At the present t
there is not a single printer that has adopted the unif
cost accounting system of the United Typothetae,
does not enjoy the highest grade credit rating in I
or Bradstreet's. Now, that is the effect of the app
tion of a knowledge of things to your business. A
accounting system, of course, from its very analy
nature injects sound accounting methods into your
ness and injects at the same time sound business
ciples, thereby making it possible for business me
constantly and to intelligently feel the pulse of indu
and to eliminate, because of that knowledge, the l
and the waste, and to intelligently plan the future.

There is no cost accounting system that exists in
for itself. It is not introduced into a business mere
convince business men, or an accountant that put i
that it is a means for a finely arranged system o
counts, which expresses a balance sheet properly, cl
fying its parts into logical groupings or which mak
possible to present a profit and loss statement in pe
form. Those things are very nice. But that is no
object of cost accounting. The object is to get you
counts working for you, in other words, to make
accounts in a way, a regulator of your business af
If accounts are expressed in the proper analytical f
they, themselves, become correctives of many of
evils, or weaknesses, that may exist in your bus
structure.

Through the comparisons that are made possib
uniform cost accounting systems, you are not only g
to help yourself, but you are going to stabilize you
tire industry. Now, I mean that in a broader sense
just merely to cut an item of expense off here, or an
of cost there. It will mean a whole lot more to a
dustry. There are so many factors over which w
times seem to have no control in business, and yet,
boil them down and we analyze them to their base
find after all, that they are controllable. For exa

---

*At Detroit convention of the International Association of Milk Dealers.

assume that we have comparative figures showing arious elements of cost among the different mem- of this association, yet I know that there will be one nt in which there will be considerable variation, ly in that of depreciation. One member will indi- a large amount of depreciation, another, a small nt of depreciation. Now, that cannot be altered, be- one man has an up-to-date, well-equipped, efficient , equipped with the latest and best type of machin- nd his equipment is not subject to a high rate of ciation, whereas, another member whose plant is cally run down, whose equipment is antidated or in condition, will have an entirely different deprecia-

Cost accounting, of course, won't provide capital e latter so that he may reconstruct his plant, but l put him on notice that if he wants to continue in ess, and to continue as an effective contributor in particular field of industry, he must face about and rnize his plant. In other words, it brings out the tance of obsolescence, the inadequacy of present ment to meet the conditions of business. People of shudder when we speak of obsolescence. They it is something horrible, that it is something like a disease. It is not. It is simply a negative term rogress. Obsolescence means that there is some- better which is taking the place of something that d die—something that should be discarded.

ur comparisons, in the depreciation element, are to show you the deficiencies that exist in your and structure. In the same way, the comparisons other lines of expenses, are going to show you the esses that exist in the other activities of your busi- So, all in all, uniform cost accounting is a con- ive piece of work and a business building factor in try. I think I already mentioned the United Typo- as an outstanding example of the good effects re- g from the adoption of uniform cost accounting.

hink the National Association of Cost Accountants, which association I have been intimately associated its inception, now has on record over 125 uniform ccounting systems. Practically 70 per cent of those ns were adopted within the last ten years. That in- s, of course, the progress in that particular line of uctive study within recent years.

nother outstanding group that has adopted uniform ccounting systems is the National Coal Association. s almost as essential, I presume, to civilization, and gress, and to good health, as milk. That association dopted uniform cost accounting, and has been ex- ly successful in connection with it. It has been en- ged, indirectly, of course, by the Federal Trade ission, as far as the National Coal Association is rned. You can remember that during the war, all e coal dealers were required to fill out elaborate ionnaires, and to prepare very detailed statements e Fuel Administration. That was, in a way—al- h it aroused a lot of opposition on the part of the lealers—a start of uniform cost accounting on the f the National Coal Association. In other words, it hem into the habit of preparing reports that had meaning. Of course, the Federal Trade Commission t time was manned, as you know, part of the time, r. Hurley, and his influence followed him for some after he resigned. Mr. Hurley, I believe, is prob- more responsible than any other man, for the large th in uniform cost accounting in this country.

e work of the National Association of Chair Man- urers is another outstanding example of the bene- be derived from a uniform cost accounting system.

ne of the essential values—I should say, one of the important applications in connection with a system iform cost accounting, is the preparation of monthly nents. We used to be in the habit, in cost accounting, and in general accounting, of waiting until the end of the year before we prepared profit and loss statements and then trusted to a hopeful inventory to put us on the right side of the balance sheet. We do not believe that business can be successfully run on an annual basis, any more. A successful business, in order to remain successful, must currently check itself. It must have current information as to all of its activities, expressed in the language which business best understands, the dollar sign; expressed, of course, intelligently. Such a procedure will bring out clearly the weaknesses in the various factors of your business, if, in fact, there be any weaknesses.

What advantages will you enjoy under your cost system? There is no reason why I should confine my talk especially to milk; it applies to tobacco manufacturers; it applies to machine production; it applies to any industry under the sun. The principles of cost accounting are the same, no matter what the individual application may be.

We have no patience, any longer, with the man who says "My business is different." One might just as well say that the study of mathematics should be different in Canada than what it is in the United States, or that the study of chemistry and chemical formulas is different because of national boundaries. There is no business that is so different but what cost accounting principles can be applied to it. Cost accounting principles are the same, no matter what the business may be. These considerations affect your association. It will make possible comparative analysis of the past, analysis of the present, and will help your plans for the future. The object of accountancy today is not so much to make records of the past but rather to prepare you for the future. I have often said that the accounting of the future is going to be an accounting of the future. The intelligent analysis of what you have been doing and what you are now doing, is going to make it possible for you to budget what you are going to do in the succeeding months and years to come. You are preparing yourselves for the progress which you, yourselves, should recognize as coming in your particular lines. You are working right towards budgetary control. Budgetary control is not a dream. It is certainly not a dream to big organizations, like Armour & Company, the Edison industries, the Bell Telephone systems, the General Electric, and a host of others. Progressive industries in this country are planning ahead, rather than resting upon their past laurels. You can readily realize that the problem is a much easier one to the smaller industries, but even the large industries are making their actual operation conform very closely to their budget estimates; budgetary control is a profit insurance instrument.

A very large concern in Chicago, the Jewel Tea Company, projects its balance sheet six months in advance and makes the mark within a few thousand dollars. How can that be done? Not by sitting down and dreaming, not by imagining what might occur in the future, not by hoping, but by analyzing the things that happened in the past and by studying present conditions. That which has been accomplished, certainly can be accomplished again, and if the proper progressive spirit pervades an organization, the past can be improved upon by intelligent planning. Planning makes all of the factors of your business fully controllable. You cannot control anything unless you know it, unless you know all of the elements that are involved in the processes of your different branches of business. Know these things, know all of your weak spots, and not only the weak spots, but know the strong spots in your business; don't take a negative attitude only and think that a cost accounting system or any accounting system exists merely to reveal weaknesses. Of course, it does but a cost accounting system,

Who Is Driving Your Motor Trucks?

The Liability of a Motor Truck Owner for Damages As a Result of Injuries. When the Milk Dealer Pays and When He Doesn't Pay

By LEO. T. PARKER

IN VIEW of the numerous past litigations involving the death or injury by motor truck of pedestrians or other vehicle occupants, the law with respect to the liability of motor truck owners is well established.

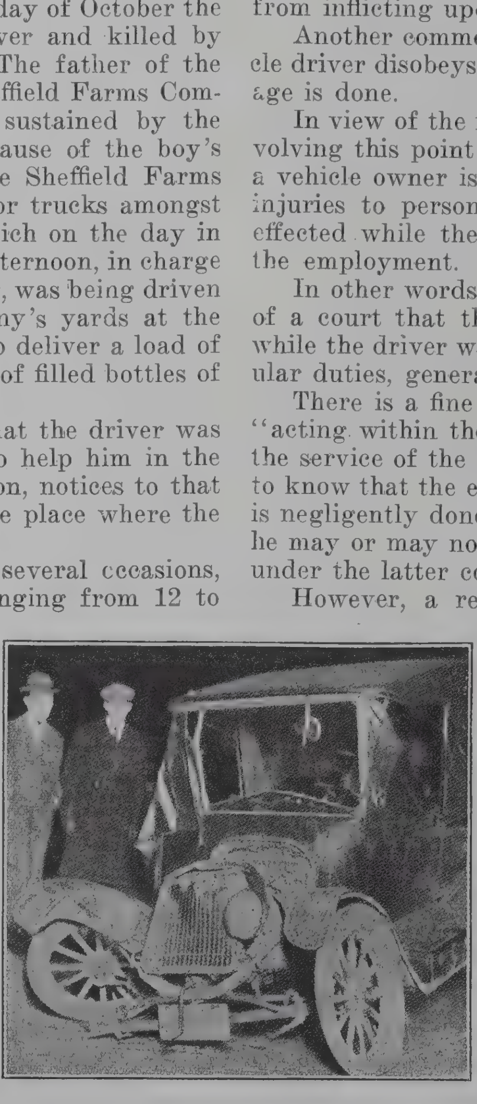
For instance, in the case of Glowacky vs. Sheffield Farms Co., 134 Atl. 674, it was disclosed that the driver of a motor truck disobeyed his employer's orders and hired a boy helper, who was killed. The facts of the case are that the Sheffield Farms Company is a corporation selling and dealing in milk at wholesale and retail. The milk was received and obtained by it in the Pennsylvania Railroad Company's yards at Jersey City, from the latter's freight cars. On the 17th day of October the plaintiff's decedent (son) was run over and killed by one of the trucks of the company. The father of the boy brought an action against the Sheffield Farms Company to recover the pecuniary loss sustained by the father and brother, alleging as the cause of the boy's death the company's negligence. The Sheffield Farms Company had in operation many motor trucks amongst which was a nine-ton Mack truck, which on the day in question, at about five o'clock in the afternoon, in charge of a chauffeur accompanied by a helper, was being driven to the Pennsylvania Railroad Company's yards at the foot of Exchange Place, Jersey City, to deliver a load of empty milk bottles and to take a load of filled bottles of milk and milk in cans.

There was uncontroverted proof that the driver was expressly forbidden to hire anyone to help him in the discharge of his duties, and, in addition, notices to that effect were conspicuously posted at the place where the drivers called for their trucks.

There was some evidence that, on several occasions, the driver's helper requested lads ranging from 12 to 15 years to help the driver, and that the latter would compensate them for their work. There was no testimony that these acts of the helper or driver were ever brought to the notice of the employer, or that he had knowledge of any such conduct as attributed to them.

The boy hailed the driver and asked him for work. The driver slowed up and permitted the boy to climb upon the running board. Immediately afterward the boy fell off and was run over.

The lower court held the Sheffield Farms Company liable for $6,000 damage, but the higher court reversed the verdict and said:



"An equal bar to a recovery is the undisputed
that the plaintiff's decedent (boy) was running fo
truck and was aware that it was not slackening its s
but was going fast, and hence was not going to sto
him and take him on; nevertheless, he made the att
to board it and succeeded in obtaining a momentary
hold, when he either slipped or fell off through the
nary movements of the vehicle. There being no
that he was invited to get on, but on the contrary
the attempt to board the truck as above stated, he
there as a trespasser, and, therefore, there was no
duty owing to him from the defendant except to re
from inflicting upon him a willful and wanton inju

Another common source of litigation is where a
cle driver disobeys his employer as a result of which
age is done.

In view of the numerous previously decided case
volving this point of the law, it is well established
a vehicle owner is not liable for damages as a resu
injuries to persons or property, unless the dama
effected while the driver is acting within the sco
the employment.

In other words, if it can be shown to the satisfa
of a court that the injury inflicting accident occ
while the driver was **not** in the act of performing hi
ular duties, generally, the employer is not liable.

There is a fine line of distinction between the
"acting within the scope of the employment," an
the service of the employer." Moreover, it is impo
to know that the employer **always** is liable when da
is negligently done under the former circumstance
he may or may not be liable when the accident hap
under the latter conditions.

However, a review of the leading cases invo
these points of the law prob
will convey the desired inform
more readily than mere exp
tion.

The facts of the quite re
decided case of Carty vs.
206 N. Y. S. 773, are intere

hall We Go To Europe In 1928?

Tentative Plans Made for a Vacation Trip for Dairymen to World's Dairy Congress Next Year in England.

Will You Join Us

?

IS Majesty King George V has given his approval of a preliminary announcement of a World's Dairy Congress to be held in great Britain during the latter part of June and the early part ly of next year. Dairymen from all over the world gather there and sessions will be held in London, ding, Edinburgh and Belfast.

he Olsen Publishing Company has made tentative ngements for chartering an ocean liner to carry deles from the United es to England and rn. Will you be one hem?

hese tentative argements provide for efinite program of ness and pleasure the time the ship es New York har- until its return e. Time will permit trips from Eng- to such continenpoints as delegates choose.

he boat selected is of the best transntic liners and will ish accommodations please everybody. h day of the trip be filled with profit pleasure for all.

hat finer vacation than to cross the n with your friends to enjoy ample for discussing the lems in which you interested?

Why not a conven- session for each ich of the industry day during the n voyage?

bviously, such a stupendous undertaking will re- e considerable time and much planning. We are ouncing tentative plans this early for the following ons:

. That you may begin now to arrange your plans to forego a vacation this year, if necessary, in order pend a month of vacation in 1928. The cost of the will be within the reach of all. In fact, by combin- your vacation for this year and next year you will l spend no more money or time than you would in ng your usual vacations.

2. In order that we may learn the sentiment in the industry and determine whether such a big plan can be carried out.

We stand ready to charter the liner on which we already have an option. We would stand ready to work out all the details, in co-operation, of course, with representatives of the different branches of the industry who may later be selected.

What we need first is your reaction to this proposed trip.

Shall we go to Great Britain, en masse, and give to the dairy industry of this country the greatest advertising impetus that it has ever enjoyed, at the same time enjoying a most delightful and profitable vacation trip?

Sit down and write us a letter and tell us whether you will plan to join in making such a trip possible. Tell us how many may be in your party as, of course, the ladies will be invited to participate.

We want no binding promises — just an expression from you that you favor the proposition and will plan to go if possible.

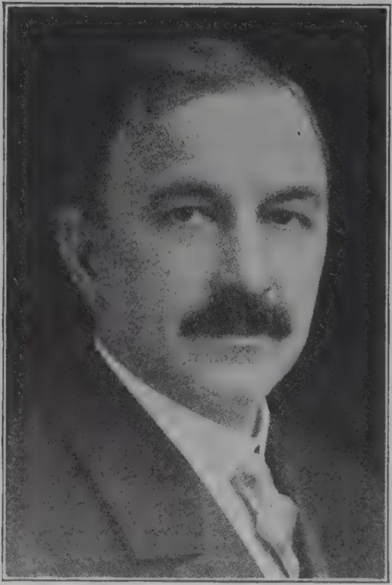
It will be a trip worth while and one long to be remembered, Delegates to the last World's Dairy Congress held in Washington, Philadelphia and Syracuse, will recall its importance and the benefits that followed.

Dairymen of this country are offered this wonderful opportunity to enjoy the benefits of the next World's Dairy Congress and at the same time enjoy one of the most delightful vacation trips possible.

Will you join us?

Write and give us your tentative reservation and then we will keep you advised from time to time of the progress made in arrangements for the trip.

Address your letter to **The Olsen Publishing Co., 501-515 Cherry St., Milwaukee, Wis.**



JOHN LE FEBER.

Big Milwaukee Dairy Plant Changes Han

The Gridley Dairy Company Buys the Geo. C. Mansfield Compa Thus Entering the Wholesale Ice Cream Manufacturing Fiel

ONE of the most important business transactions, and one of special interest to milk dealers and ice cream manufacturers, was the transfer recently of the plant, business, good will, 'everything of the Geo. C. Mansfield Company of Milwaukee to the Gridley Dairy Company of the same city. The transfer took place on February 1st.

The Gridley Dairy Company is the largest distributor of milk and manufacturer of butter in the state of Wisconsin. "The most efficient dairy organization in the world," one enthusiastic friend of the company remarked not long ago in our hearing, and he is a man who knows the business and who has traveled far and wide.

The Gridley Dairy Company is now a manufacturer of ice cream as well as other dairy products. In acquiring the business of the Geo. C. Mansfield Company they have taken over "the second largest ice cream business in Wisconsin," according to Geo. D. Mansfield, president and general manager of the company. In addition to the manufacture of ice cream the business of the Mansfield Company includes the manufacture and wholesaling of artificial ice, and they also do a public cold storage business.

The business was originally established at Jo Creek, Wisconsin, in 1860 by Geo. C. Mansfield, f of Geo. D. Mansfield, the Milwaukee business oper as a branch for a few years after its establishme 1902. Thus, for over 65 years the Geo. C. Mansfield pany has been identified with the progress and de ment of dairying in the leading dairy state of the U Geo. C. Mansfield was one of the first men to oper gathered cream creamery in southern Wisconsin, a credited with owning and operating the first cream arator used in the state.

GEO. D. MANSFIELD.

In retiring from active participation in the products manufacing field, Mr. Mansfield is leaving a sphere of action in which he has played an important role for 40 years. Born in Johnson Creek, Wis., in 1863, Mr. Mansfield spent several years of his early manhood railroading. In 1887 he became manager of his father's line of whole milk creameries. He owned 26 of them and controlled the output of 20 more.

MANSFIELDS
MANSFIELDS

rrangement lasted two years and then the call of g city took the young man to Chicago, where he four years in the wholesale butter business.

the spring of 1893 he again became associated with o. C. Mansfield Company and took charge of ten company's creameries located in Edgerton, Wis., adjacent communities. In 1900 the Senior Mans- etired from active business and the Junior moved nson Creek and took over the general management. o years later, in 1902, the Milwaukee branch was l in the basement of the Milwaukee Cold Storage Eighteen months later, the business having out- its quarters, it was moved to another rented build- the corner of Prairie and 4th Sts. There the busi- rew and prospered until April 17, 1908, when the nit of the present fine plant was occupied, and the ny had acquired its own home.

e greatest development in the business dates from when the company moved to its present location and Poplar Sts., and when the executive offices noved to Milwaukee. The public cold storage and es date from that time.

even years later, in 1919, the second unit of the t big plant was occupied, thus providing the busi- ith a building 150x150 feet, four stories and base- At that time the ice cream department was moved he new annex and a wholesale ice department in- ated.

aven't made any plans, just going to take a good said Mr. Mansfield, as we pressed him for a state- ne day recently when we caught him in a reminis- ood. "I am turning over to the Gridley Company business, built on honor and integrity. The build- this business to its present magnitude and stand- the trade has been a joy to me, and it is a great ction to be able to turn it over to an organization e Gridley Dairy Company."

ose who know Mr. Mansfield and who are familiar is business policies and ideals can understand why gratified to know that the business has gone into hands. He retires with honors from a field of y in which he has not only won business success, which he has also won the respect and esteem of o know him.

The Gridley Dairy Company.

bit of history of the development of Wisconsin's nding dairy products business institution will add st to the story. In taking over the Mansfield plant idley Dairy Company will add another half million s' business to the already huge business of that Last year the volume totalled over eight and one- illion dollars.

e story of the company's development reads almost omance; in fact it seems almost like romance to an who has guided the policies of the company all the years.

st folks in all branches of the dairy products in- es know John Le Feber, president of the Gridley Company. He has played an important part not n building his own organization, but also in de- ng trade association work the country over. He ast president of the International Association of Dealers and has been active for many years in help- promote anything and everything to advance the ry.

rty years ago he was a farmer, living near Milwau- He was then 23 years old, and it was at that time one of his neighbors asked him to buy his milk ss, which then meant a herd of milking cows, milk , and the renting of a farm.

After negotiating with this neighbor for about a day he bought from him a herd of about 100 head of cows, two milk routes, and about eight horses, and agreed to rent the farm of 145 acres. This was a milk business that had been started by a retired businessman who had grown tired of his venture.

When Mr. Le Feber bought this business it was the first bottled milk distributing concern this side of New York City. This business was carried on for a number of years by running the milk routes from the farm, one of the routes being run by himself most of the time. He says that that was the time when everyone who distributed milk in the city owned his own cows, and produced all of his own milk. To deal in milk was unknown at that time.

This business was built up to three routes after a number of years, and then he conceived the idea of merging with other small dealers, and, after such merger was accomplished with three of his competitors as a partnership, he finally consolidated with the Gridley Dairy Company; his organization being just a partnership, and the Gridley Dairy Company being a corporation.

The capital stock of the company was increased, and has been continued under that name ever since, although Mr. Gridley's interest was bought shortly after the consolidation. The combined companies at that time were operating about 18 routes.

The first "down town" location of the company was at 412 Grand Avenue, where one of the city's big department stores now stands, and where the business was established on April 1, 1903. Six years later the first unit of the present plant on Eighth street was erected, and eight years later the second unit was built, the present building being 95x150, five floors and basement.

In addition to this main plant the company operates four big branch plants which are complete in themselves. These are located, one in a western suburb and the other three in strategic locations in the city of Milwaukee.

The Gridley Dairy Company operates 316 milk routes and supplies approximately 80,000 families daily with their milk and other milk products, including "Gridley's" famous sweet cream butter.

Mr. Le Feber was the first president of the Wisconsin Milk Producers' Association, and at that time Eugene Chafin, later a candidate for the presidency of the United States, was secretary. Thus we delve, just for the moment, into the history of pioneer dairying in Wisconsin.

Mr. Le Feber, in addition to performing his duties as president of the Gridley Dairy Company, finds time to direct one of the city's large banks. He is president of the Grand and Sixth Street National Bank of Milwaukee.

When we asked him for a statement relative to his plans for conducting the business of the newly acquired Mansfield Company he replied: "We shall operate our ice cream business as a department of our business. We hope to make 'Gridley's' ice cream as well and favorably known as our other products. Our ambition is to make the best ice cream that can be produced. We will expect to build the business larger and larger only as we build on high quality. A. H. Graeszel, who has been secretary and plant manager of the Mansfield plant for many years, will continue in charge of the business under the direction of M. Van Antwerpen, our vice-president."

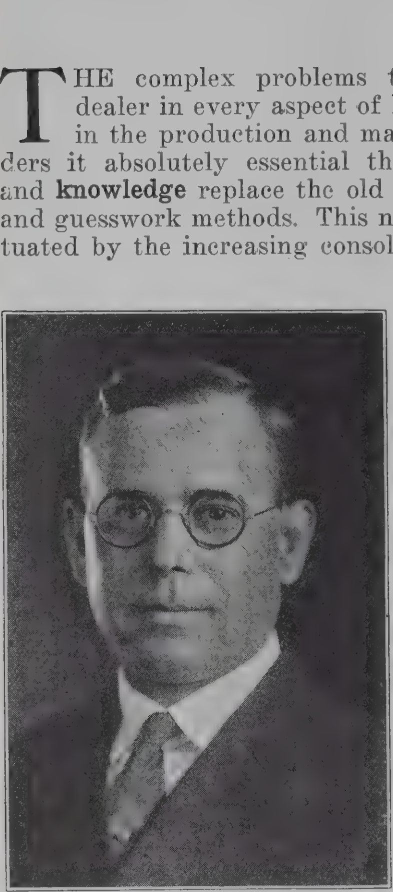
Readers who know the Gridley organization and the company's products will best understand what Mr. Le Feber means when he says that his ambition is to put out the best ice cream that it is possible to produce. He has the experience, the facilities and the organization to do what he starts out to do.

Taking Guess Work Out of Milk Plant Management

How One Plant Was Transformed from a Money-Losing to a Money-Making Institution

By N. E. LAZARUS*

THE complex problems that confront the milk dealer in every aspect of his business, particularly in the production and manufacturing phases, renders it absolutely essential that **accurate information** and **knowledge** replace the old fashioned rule of thumb and guesswork methods. This necessity is further accentuated by the increasing consolidation and combination of large plants that is now prevalent in the dairy industry.



N. E. LAZARUS.

The tendency up to the present time has been for milk distributors to center their attention on distribution and sales problems. The up-to-date distributor is realizing however that profits can be made, by proper analysis and efficiency, in the production and manufacturing ends of his business as well as in the distribution end.

It is a serious problem which confronts the average milk distributor—how to meet keen competition and show a balance on the right side of the ledger. Fortunately, there is a logical and practical solution to that problem and the answer is found in that old maxim, "Knowledge is Power."

The first principle in the application of that maxim is the elimination of guess-work. A series of questions, somewhat similar to the following, is advantageous in the campaign for elimination of guess-work:

1. What are present conditions in my business?
2. Are we providing the best quality of milk and by-products?
3. Are we getting the lowest possible costs?
4. Can we increase production economically?
5. Is our help satisfied?
6. Can we get larger profits?

The solution of these questions usually opens a fertile field for improvement and correction of existing conditions. If properly answered, the results will soon be apparent in the visible, satisfactory form of increased sales and profits.

The best way to gather the facts which are essential in the solution of these questions is by means of a **survey** of **cold facts**. Such a "cold fact survey" is practically a written examination consisting of a series of questions which delve into every nook and corner of the physical and operating parts of plant management. In order to be of value, however, it is absolutely essential that **every** fact and condition be dug out, no matter how unpleasant the revelation may be. Then by the application of
mon sense, unbiased observation and practical knowl
there will be no difficulty in remedying the trouble
is amazing how quickly, faulty conditions become ap
ent when you get them down on paper.

The writer recently made such a "cold fact surv
for a large Eastern corporation. Like most succes
dairy concerns, this concern built additional cou
plants or purchased them as necessity or business ex
sion required. These plants had been erected on
basis of fitting the machinery and apparatus after it
built, instead of the modern and efficient method of p
ning for the necessary machinery to do the required w
efficiently and then erecting the building around
machinery. There is a world of difference in econ
efficiency and profit between those two method
building.

However, here were the plants already in opera
and, as a result of lack of proper planning, were r
rially affecting the earning capacity of the corpora

The "cold fact survey" was started. It naturally
into two divisions:

A—An analysis of every factor that enters into the ph
aspects of the plant.

B—An analysis of every factor that entered into the oper
aspects of the plant.

The physical aspects were then subdivided some
as follows:

General Information—location, shipping facilities, fr
rates, etc.

Buildings and Real Estate—description, conditions,
Water Supply—quantity, location, kind, etc.
Sewage—method of disposal, size, efficiency, etc.
Power Generation—type, condition, capacity, etc.
Refrigeration—type, efficiency, etc.
Hauling—equipment, conditions, etc.

**The installation of the two square precoolers and the in
tube condensed milk cooler replaced six circular coolers,
which is shown in the foreground. This system enable
plant to take care of three pans working continuously.
heated plain condensed is cooled from a temperature of
grees F. to 40 degrees F. at a rate of 72 cans per hour.**

All other physical aspects, such as pumps, en
and equipment of all description, were subjected to
detailed questionnaire showing all present condi
whether good, bad or indifferent. The object, of c
was to get every ounce of information down on pap

---

* President, Lacteal Analytical Laboratories, Inc.

re analysis. In addition, whenever possible, photo-hs and maps were made, in order to have visual in-nation to amplify the written.

The **operating** aspects presented a more difficult task use here we came in contact with that variable fac- human and machine efficiency. These aspects were ded somewhat, as follows:

ersonnel—duties, qualifications, etc., of employees.
aw Milk Supply—quality, variation, territory, etc.
Milk Receiving Department—equipment, supplies, opera-
s.
ccounting and Cost System—methods, efficiency, etc.
aboratory Department—equipment, supplies, operations.
ottling and Canning Department—equipment, supplies,
ations.
ream Department—equipment, supplies, operations.
utter Department—equipment, supplies, operations.
owdered Milk Department—equipment, supplies, opera-
s.
ondensed Milk Department—equipment, supplies, opera-
s.
heese Department—equipment, supplies, operations.

aving accomplished the survey, the next step was nalyze the information it contained and then to sum-ize and diagnose the faulty conditions disclosed by survey. This particular survey disclosed thirty faulty sical conditions and fifteen faulty operating condi-s, although the latter were sometimes the direct cause aulty physical conditions.

or instance, the survey showed that this plant had ty physical conditions which seriously handicapped proper operation of the plant at the peak load period, n the raw milk supply was at its flush. Any break-n at one of several points, at this time, would result large monetary loss. As a matter of fact, the execu-s of that organization had accepted the condition as of the hazards common to the dairy industry. The ey disclosed that the plant was not flexible enough bsorb the raw supply in times of flush production. consequence, the surplus raw milk, of necessity, was ufactured into unprofitable products that were usual- glut upon the market.

With these and other faulty conditions clearly indi-d by the survey, the final step was to recommend nges to improve or eliminate the faulty conditions to put the recommendations into effect.

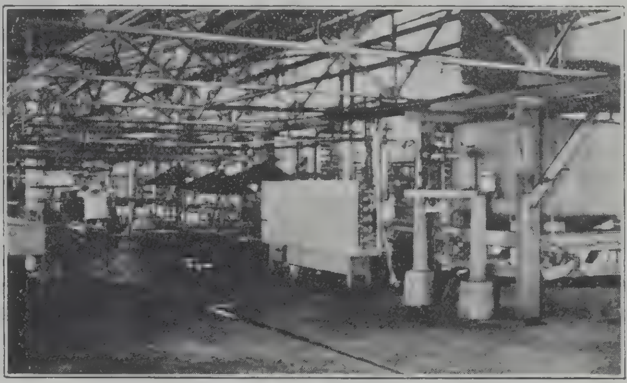
ight here is where common sense and practical wledge was essential. It is a real temptation to make nges which are not only expensive but may prove to valueless after they are put into effect. Probably e time was devoted to this phase of the work than to of the preliminaries.

loseup view of hot wells showing usual method of heating nts with steam which adds about 10 per cent extra mois- that the fans have to condense. By first heating the milk heater (tubular type) this excess moisture was eliminated.

he first essential was to place the plant in a flexible lition, just as a banker would first solve the problem ransforming frozen assets into liquid assets. The factors that affect the flexibility of a milk plant are as follows:

1. Sufficient water supply.
2. Sufficient boiler and refrigeration capacity.
3. Proper apparatus for manufacturing by-products.
4. Peak load capacity of machinery and apparatus.

As an illustration of the manner in which this flexibility was accomplished, the survey disclosed the fact that four boilers of 150 H. P. each were being used to capacity, in order to furnish sufficient steam to operate the pasteurization of 1,800 gallons of milk, running four separators, three vacuum pans and a spray system powder unit, in addition to water pumps, engines, etc. Here was a dangerous condition. If one boiler were to be out of commission, the plant would be unable to function because of lack of steam. It was also very hard to give the boilers proper attention, as they were in constant service. However, as a result of methodical analysis and observation, changes, involving little cash outlay, remedied the trouble so that three boilers furnished ample steam to take care of all peak operations and at other times two boilers were sufficient.



Another view showing the high temperature milk heater which heats the skim or milk going to the hot wells to a temperature of 190 degrees F. This replaces the usual method of using direct steam in hot wells, a bad practice which adds 20 per cent moisture to the mixture in the hot wells. The combined weigh scale and standardizing tank in the foreground insures standardized cream and condensed goods.

Another instance, was the fact that it took about four hours to cool a batch of condensed milk. By purchasing a condensed milk cooler of the continuous type and connecting it up with the vat type cooler. The vacuum pans were kept going at maximum speed, the peak steam load was distributed evenly throughout the working day and labor costs were radically reduced.

Another recommendation put into effect that was an immediate profit maker, was the substitution of two glass lined tank trucks to replace three trucks of three-ton capacity and three Fords of one-ton capacity in hauling raw milk from feeder plants to the main plant.

One of the important recommendations put into effect was a practical system of cost accounting which included report forms, dairy operating and inventory reports, etc., so that exact information was had daily of the distribution of every pound of milk. Sufficient emphasis cannot be placed upon the necessity of a practical system of records, if guesswork is to be eliminated.

A total of sixteen recommendations were put into effect in this plant, which corrected practically all of the physical and operating faulty conditions disclosed by the survey. Today this plant is functioning as a large plant of its size should. It is in excellent physical condition, capable of handling an increased quantity of milk, even in flush time, at lower costs and greater efficiency.

There is no desire in citing this particular plant, to give an erroneous impression that all milk plants require drastic change or have many faulty conditions. It is absolutely true, however, that every milk plant will be benefited by a survey along the lines indicated. Labor costs can be reduced, proper planning may shorten and improve operating methods, and a host of apparently insignificant leaks, will become apparent and easily remedied by the use of a survey.

A survey will determine whether you are actually putting out high quality products or whether you are deluded into thinking so.

Know your costs; no plant can be successful otherwise. The daily operating and inventory report form was an essential factor in eliminating guesswork for one milk company. By means of this report, they now can tell **every day** how their raw milk supply was distributed and manufactured.

Is the apparatus in your plants properly arranged so as to save extra help and time? Just a little sketch of present arrangements on paper will show you visually hitherto unseen possibilities for improvement.

Is your help satisfied? Are you getting all the work you are entitled to receive? Don't blame them! Have **you** done your share by training them properly; explaining the importance of their work to the finished product? Just a short series of educational talks saved a long established plant from going into discard. Give the men a square deal, standardize their jobs, work with them and you'll be surprised at the results attained.

The subject of practical milk plant efficiency requires considerable study and its many ramifications cannot be written in an article of this nature.

However, if the milk distributor will follow out the suggestion of a "cold fact survey" and apply it with common sense to his production and manufacturing operation, he will be amply rewarded financially. "Knowledge is power."

DAIRY PRODUCTS MEN MEET AT FREDERICK, MARYLAND.

A representative crowd of dairy manufacturers—the count being evenly divided between milk men and ice rceam men—attended the Dairy Products Merchandising Conference at Frederick, Maryland, January 26, 1927.

W. Horace Harper, secretary of the Baltimore Dairy Council, discussed the activities of dairy council work. He emphasized the fact that the dairy council is strictly an educational organization to acquaint people with the food value of dairy products. This organization cooperates with parent groups, girls' clubs and teachers of public schools by the use of motion pictures, exhibits and publicity as well as actual demonstrations in food products. This, coupled with the health-giving and nutritious character of the products, makes the work of the organization very popular.

Problems of the individual manufacturer of dairy products were discussed by R. C. Munkwitz, assistant professor in dairying at the University of Maryland. He cited particularly the losses an organization experienced by placing salesmen in the field who are uninformed about the quality of the product, or principles and policies of the organization they represent. Varied uses of the telephone and follow-up letters were taken up, stating they can be ably applied in the merchandising of dairy products, as means of publicity heretofore practically untouched but offering many possibilities if properly executed.

The lunch served by the cafeteria was delicious and wholesome. It fully demonstrated the possibility of supplying lunches consisting of vegetables, bread and dairy products.

ADVERTISED BUTTER ON MILK TICKET

Milk is a commodity, distributed to tens of thous of Denver families, for which the Windsor Farm has best been known for years. It is milk which is tured in the company's advertising. But Windsor butter, too—hence a milk ticket advertising plan.

A principle of sales demonstrated by many hun of advertisers is development of greater volume t crease the sales to present customers. In practice dairy with second and third products can find new

A picture showing the girls at Windsor Dairy wrapping was used on the back of milk tickets.

tomers for these with greatest readiness among pr customers for the first product.

Milk tickets went to the company's many thous of customers. So special advertising for the milk ti was devised.

An expert commercial photographer was calle the company's plant where he took two pictures i butter department. One of these was selected, made, and the milk ticket printed with it upon the of each.

The half-tone herewith shows the photograph The fresh, wholesome lasses in pure white uniforms shown at the wrapping table, a half dozen of them. looked happy, too.

Of course, the cut upon the ticket back cost thing to put there, but the advertising was extre inexpensive. There was no distribution expense a no expense for stock. And present customers by wholesale found the advertising upon something for once they had no wish to destroy!

As an oft quoted Chinese proverb says, "A pi is worth a thousand words." Commercial photog taken by experts, are not expensive, seldom excee $3.50 for an 8 by 10 interior, with considerable prices for exteriors. There are other milk ticke the country which would benefit by this advert idea of the Windsor Farm Dairy of Colorado.

NEW COMPANY TO HANDLE 1,500 GALLONS MILK DAILY.

The Lexington Dairy Co. of Lexington, Ky., has incorporated with a capital of $25,000 to manufa butter and engage in the milk business. The incor tors are N. J. Steinau, Louisville; Jacob Abraham, byville, and C. Shields, I. Abraham and Philip W all of Louisville.

Plans are under way for the construction of a m sanitary plant, the location of which has not been mined. Equipment has been purchased and will stalled with the approval of the city and state b of health.

New Series
De Laval Separators

Average skim-milk test is a slight 1/100 of 1%

THE Western Dairy and Ice Cream Company of St. Joseph, Mo., skims from 10,000 to 25,000 pounds of milk per day with the New Series De Laval Separator and keeps an accurate daily record of their skim-milk and cream tests. They write:

"The approximate average cream test for the entire period of use is 58% butter-fat while the approximate average test of the skim-milk is only a slight 1/100 of 1%.

"From the standpoint of skimming efficiency and durability we will say this machine has no equal."

This proves the statement made in recent De Laval advertisements to the effect that the New Series De Laval produces very heavy cream with less loss of butter-fat than was ever before possible. Obviously, it will also make a marked reduction in butter-fat losses when producing thinner cream, for any separator which will skim to less than 1/100 of 1% with cream testing 58% can be depended upon to skim equally clean under any other reasonable condition of separator use.

You owe it to yourself to obtain full information on the size of New Series De Laval Separator adapted to the needs of your plant.

The Use of Gelatine In Buttermilk

What Authorities the Country Over Think of the Practice of Adding Gelatine to Cultured Buttermilk. Facts That Every Milk Dealer Should Know

IN THE January issue of The Milk Dealer there was printed, on page 27, an item written by J. J. Frey, chief of the bureau of dairy control of California, in which the chief remarked that the use of gelatine in buttermilk was objectionable. To make this point clear and to emphasize his position, the California chief quotes the provisions of the California law, a section of which reads as follows: "It shall be unlawful for any person to produce, manufacture or prepare for sale, or to sell, or to offer for sale, or to have on hand for sale, any milk or product of milk, to which any coloring matter, except as otherwise provided in this act, has been added by any person or to which any gelatine or any other substance, except as otherwise provided in this act, has been added by any person to increase the consistency of such milk, or product of milk, so as to make it appear richer or of better quality...."

Following publication of this item, The Milk Dealer, in order to shed further light upon the subject of gelatine in buttermilk, addressed letters to several of the health commissioners of the larger cities in the United States. Letters of similar inquiry were also addressed to many of the state agricultural colleges. With replies from these institutions and these health authorities, it was thought that milk dealers who are interested in the subject for the reason that they are interested in any product which will tend to increase the palatability, healthfulness and sale of milk and milk products, would be in better position to combat, if necessary, the prejudices and other contra-appreciative results which are secured by the addition of gelatine to buttermilk.

The assembling of opinions and data from these influential sources might be undertaken by the manufacturers of gelatine but it resolves itself into a rather too delicate subject for them to broach directly inasmuch as they are monetarily interested. The Milk Dealer can take up and discuss the question from an unbiased standpoint with only the interests of the milk dealers at heart, which must include, the interest to help produce better, more nutritious dairy products which will assist the milk dealer in making greater sales and greater total net profits from his business enterprise.

In view of the fact that the use of gelatine in manufacturing commercial buttermilk is becoming more and more general among the milk plants of the country, we asked Prof. H. H. Sommer of the University of Wisconsin to give us his opinion. His reply, in part, follows:

"Permission to use gelatine in commercial buttermilk by food officials, in my opinion, can be justified for the reasons that: First, gelatine is a well recognized edible food substance. Second, the use of gelatine in cultured buttermilk tends to produce a better product and thus encourages a greater consumption of milk. Third, the addition of gelatine tends to aid digestion, because of the fact that it prevents coarse curd particles. Fourth, it would not be a deception, because there is no intention to sell such a cultured buttermilk as real (churn) buttermilk."

This opinion of Prof. Sommer's is held in substance by many of the nation's leading health authorities, though there are also those who take an opposite view of the matter. From the state of West Virginia we have the following: "The law of West Virginia does not prevent the use of gelatine in the manufacture of mercial buttermilk. I have no definite data avai but am inclined to believe that most of the butte sold in the state is of that character." This lette written by W. T. Henshaw, M.D., state health missioner.

Something of the attitude which a few health missioners take upon this subject is revealed in a to our letter by C. C. Slemons, M.D., health offic Grand Rapids, Mich., who says: "........the u gelatine in producing commercial buttermilk is n lowed."

A similar expression of forbiddance is give Thomas J. Steele, acting chief milk inspector of J City, N. J. "Under our state regulations, the u gelatine in buttermilk is an adulteration and ther cannot sanction the use of the same," says Mr. S

Cleveland sends a similar expression, as Haro Knapp, M. D., chief of the department of public h and welfare, writes: "In the opinion of this office atine may not be added to buttermilk, unless its pre be clearly stated upon the label appearing upo container in which the product is sold. Ohio standards prescribe: 'Buttermilk is the product th mains when fat is removed from milk or cream i process of churning.' "

This letter has also brought up the subject probable or possible necessity of "labeling." Pur laws have become so stringent, and rightly, that su and truthful descriptions of food products are th and it may be required that buttermilk which in the addition of gelatine be some way labelled s the bottle cap states that gelatine is used.

An expression from the city of Evansville, board of health and signed by Walter E. Zumstein inspector, says: "We are in favor of the use of ge in cultured buttermilk as we recognize its high value." Here is a direct endorsement.

Paul C. Schotte, Ph. D., health officer of the d ment of health, Irvington, N. J., summarizes th like this: "——regarding my opinion of the use atine in buttermilk, will say that I can see no obj from a health standpoint providing milk of this c properly marked, so as to avoid deception, even t the deception be harmless."

Still additional evidence that labelling may be sary comes from A. L. Stone, M.D., director of t partment of public health, Camden, N. J., who vi "I can see no reason why gelatine could not be cultured buttermilk and sold as such. Butterm sold, not in competition, but as a food or corr Hence if labeled it would be lawful to sell the Personally, I believe the product would be impro the addition of gelatine." This is also testimon the use of gelatine.

The health commissioner of Buffalo, N. Y., do think that gelatinized buttermilk is really butte He writes: "......As to the attitude of this ment respecting the use of gelatine in producin mercial buttermilk, would say that we cannot s reason why gelatine may not be used in correct tions in a synthetic buttermilk so-called. I however, that any such food article should be sol

THAT the problem of the heating and ventilating of a milk plant and creamery should be left to men who have a comprehensive knowledge of the subject is obvious, when we consider the factors to be dealt with.

THE operation of the plant in practically every detail entails the use of water in some form or other. Rates of air change necessary to the removal of the excessive moisture vary according to the operations of the plant.

THE amount of heat required depends upon the air change provided by the ventilating system.

TO deliver a satisfactory and profitable air condition demands familiarity with your business, your product, and the machinery and equipment you use, as well as a knowledge of the handling of air.

More than two thousand dollars saved annually

The installation of Edison Batteries on six electric delivery trucks operated by a Maryland manufacturer and distributor of a well known food product saves $2,246.40 annually.

We quote from the original survey: "And more important, even, than lower costs, is the fact that Edison Batteries are dependable, delivering the full rated power every day—and so strongly built that no battery repairs are necessary." The first Edison Battery, purchased by this company over seven years ago, is still giving good service daily.
